FOREWORD

Many are aware that the small scattered communities of the Atlantic fringe of Scotland still pursue an uncertain livelihood by farming under the system known as crofting. There are many, too, who know that the system is in decay and that steps must be taken if the economic decline which threatens these communities with ultimate extinction is to be arrested. Yet, despite various proposals for improvement, the exact nature of the crofting system itself has never been fully investigated. Clearly it is important to do so and the best way of achieving this is by a full survey of the existing conditions. A valuable start was made in the West Highland Survey by F. Fraser Darling which appeared in 1955. In 1956, more intensive studies of particular crofting areas were begun by members of the Department of Geography of Glasgow University under the direction of Mr. H. A. Moisley and Dr. J. B. Caird who thereby initiated the Crofting Survey. Studies were made in Benbecula and South Uist in 1956, in Barra in 1957, in Harris and Waternish (Skye) in 1958, and the value of a team of geographers for such work has been amply demonstrated. For the first time, moreover, survey and mapping techniques were applied to the township as the working unit, for the township is the real basis of the crofting organisation.

The success of the South Uist project made these further surveys desirable and another opportunity occurred in 1958 when the organisers of the Crofting Survey invited the co-operation of the Geographical Field Group in making a study of the Park district of the island of Lewis. The Geographical Field Group gladly responded to this invitation to contribute to a field study so closely consistent with its own aims and practice. The members of the Group who took part in the survey did so with a strong sense of purpose, recognising from the outset that the Crofting Survey deserved serious support. Together with members of the Department of Geography at Glasgow they made an effective team. The results of their study which forms the subject of the present report, ably prepared by Dr. Caird, make an impressive record from which there already emerges a clearer understanding of the crofting problem. The report is worthy of wide recognition and it is to be hoped that it will be followed by others dealing with different areas.

K. C. EDWARDS

President, Geographical Field Group.

INTRODUCTION

121 Since 1955, staff and students of the Geography Department, Glasgow University, have been
114 engaged in a survey of Crofting Districts. This survey is intended neither to rival nor to replace the work of Collier and Fraser Darling, but to supplement their studies by more detailed field work: in the areas selected every croft is visited; so far, including Park, 2,250 crofts have been recorded.

After the publication in 1957, by The Scotsman, of two articles on South Uist by Mr. H.A. Moisley, the Pairc Association inquired whether a similar survey could be carried out in their area of Lewis. Initial arrangements were made by Mr. Moisley, with the co-operation of Mr. MacMillan, secretary of the Pairc Association, and eleven members of the Geographical Field Group spent almost three weeks of their summer holidays working in Park, led by Dr. J.B. Caird, assisted by Miss Catherine B. Smith. The party worked in small groups, each making a particular study of one or two townships. Neither croft nor township boundaries are recorded on any published maps; these were obtained so that land use and house sites could be plotted on 1:2500 plans; details of crops and stock were recorded for every croft and an enumeration of population made for each household, the latter being done by Dr. Caird as a rule, with the help of local residents. Only in this way can a true picture of contemporary crofting be obtained, for official sources, such as the Census and annual Agricultural Statistics, deal mainly with counties, only occasionally with parishes, and never with townships. Yet it is the township groups which are the essence of Crofting.

114 The people of Park showed great kindness in answering innumerable questions with truth and
123 good humour. Their hospitality was quite overwhelming; without their willing co-operation this study could never have achieved any degree of completeness. It would be invidious to mention any single member; all did their utmost to help, but without Mr. MacMillan nothing would have been possible. It was he who found accommodation for the party in a community where tourist accomodation is almost unknown, and for this, and for much other help, we owe him a great debt. To our hostesses, Mrs. Campbell, 13 Gravir, Mrs. Macaskill, Heatherview, and Mrs. Macaskill, 13 Glengravir, we are perhaps in the greatest debt: they looked after us so very well and unsparingly, and from them we learned the values and outlook of the Park community. By way of pre-
114 paration, much help was given by Mr. D.M. Mackinnon, the estate factor, by Mr. Donald Mackay,
123 11A Kershadir, by the staffs of Messrs. David Macbrayne, of the office of the Registrar-General for Scotland, of Register House, of the Department of Health for Scotland and, in particular, of the
123 Department of Agriculture for Scotland. Finally, thanks are due to Miss Bridget M. Gordon, B.A., B.Litt., for the appendix on place names, and to the practical agriculturalist who made an assessment of the agricultural economy possible.

The township reports were prepared by the individual members and the editor contributed the general chapters. The editor would like to record here his personal thanks to the party. Few leaders can have been blessed with such cheerful enthusiasm, steady application and willingness to work long hours; they mastered the methods and techniques of the survey extremely quickly and added new ones. The quality of their field work may be judged from their reports. The checking, organising and filing of the data both in the field and afterwards, as well as the preparation of the tables for the present report, could not have been done without the skill and enthusiasm of Miss Smith. Thanks are also due to Mrs. Esme Diamond and Miss Smith for typing the draft and especially to Mr. I.A.G. Kinniburgh, Cartographer in Glasgow University Geography Department for re-drawing the maps and diagrams.

000 The value of the field work lies not only in the present report, but also in this permanent statistical and cartographic record in Glasgow, to which we hope present and future research workers will be able to refer.

THE ENVIRONMENT

13 The district of Park lies in the parish of Lochs in south-east Lewis, almost cut off from the
101 rest of Lewis and Harris by Loch Erisort to the north and Loch Seaforth to the west. The district may be divided into two regions by Loch Shell and the valley to the west: this subdivision is meaningful physically, historically and from the socio-economic point of view.

13 The northern part of Park is a low, mamillated, ice-scraped plateau at an average altitude of 250 feet and a maximum altitude of about 450 feet, developed on Lewisian gneiss, a resistant acid rock of Pre-Cambrian age. Glacial erosion has scoured the area and expanses of bare rock are everywhere apparent. Coarse drift deposits are scattered throughout the area, but are more continuous along the southern shores of Loch Erisort between Shieldernish and Caversta, and at the head of Loch Ouirn. The cool, humid oceanic climate has led to the widespread accumulation of peat, and in the interior there are extensive areas of blanket bog. The Minch coast is rugged with cliffs attaining a height of 350 feet at Kebock Head, but there are several sheltered bays and inlets around which the crofting townships cling to the steep slopes. Along the more sheltered shores of Loch Erisort cliff features are almost absent and the physical landscape is less harsh and uninviting.

The mountainous area south of Loch Shell, an eastward continuation of the North Harris hills, attains a height of 1,885 feet. Glacial erosion has had more spectacular effects than in northern
8 14 Park and corries and glacially modified valleys are numerous. Southern Park is now uninhabited but during the early nineteenth century a small population was scattered round the shores of the peninsula on areas of drift deposits.

There are no climatic statistics for Park, but the Stornoway figures can reasonably be applied to northern Park. The mean annual temperature for Stornoway is 47°F. ranging from 41°F in January and February to 56°F. in July. The mean annual rainfall in Stornoway is 50 inches, with May and June the driest months, but on average there are 260 rainy days. Wind, however, is the most notable element in the climate: an average of 155 days have gusts exceeding 38 m. p. h.

Soils are thin and immature, except on isolated patches of deeper drift: vegetation is dominated by heather (calluna vulgaris) purple moor grass (molinia) and sphagnum, and there are few trees, stunted rowans being almost the only species; trees are confined to islands in lochs and cliffs inaccessible to stock.

861 The aspect of Park is thus one of desolate moorland, and the human communities are without exception distributed round the coasts; the Minch coast townships are situated on sheltered bays or inlets and it is clear that the harvest of the sea was the original attraction rather than the agricultural possibilities on steeply sloping, rocky terrain.

18 Park is the most isolated area of Lewis apart from South-west Uig. A sea-journey of only nine miles separates Lemreway in the south from Stornoway but the overland distance is 36 miles, which takes more than two hours by the daily bus service. Until 1924, there was no through-road beyond Habost although the Congested Districts Board provided a grant for the making of a road between Gravir and Cromore in 1901; in 1913 this road was extended to Garyvard. With the coming of the road, and the decline in the numbers of fishing boats, the people of Park have ceased to travel to Stornoway by sea. In terms of distance, Park is now more isolated than ever before.

101 Isolated, poor agriculturally, and without any industry, Park is a "Region of Difficulty" with
13 a rapidly declining population; basically the environment has little to offer in the twentieth
14 century.

THE MAKING OF THE CROFTING LANDSCAPE

17 All landscapes in these islands have roots in the distant past; Park is no exception. Yet many crofting landscapes have been significantly re-fashioned within the present century after major changes in the nineteenth century. Park does not entirely correspond to the general pattern, and the present cultural landscape has its beginnings in the late seventeenth century, although there are traces of earlier settlement.

Archaeological evidence, in the form of a stone axehead found near Habost, a dun on the brackish Loch Cromore, and a mediaeval chapel on Eilean Calum Cille, provides the earliest
108 record of human settlement in Park. Place-name evidence[1] indicates Norse occupation: the elements
17 'bost', a contraction of the Norse word bolstradr - a homestead, and 'setr', a shed or bothy situated on pastureland but not regularly lived in, indicate a thin dispersion of farmers practising an extensive and transhumant economy: all the present township names contain Norse elements.

The name Park, is derived from the Gaelic 'A'Phairc' - the park or deer forest: the old name of the district was Oservaul -(Norse: the east mountain). During the eighteenth century, a dyke or turf wall was built between Loch Erisort and Loch Seaforth - 'garadh an tighearna' - the lord of chiefs' dyke, to enclose the deer forest. Before this enclosure was built, Park was shieling ground used by tenants in Uig (west Lewis):- one of the groups of shielings has the name Airigh Dhomhnaill Chaim and Domhnall Cam was chief of the MacAulays in Uig at the beginning of the
[162] seventeenth century. Thus it may well be that after the Norse population left or were absorbed, Park was simply used as summer pasture.

17 It is believed that settlement in what is now the Deer Forest began about 1650. Confirmation of
538 this comes from an unpublished Gaelic song by Archibald MacDonald (An Ciaran Mabach) composed
539 in Leith soon after 1660. In the song, the author laments the fact that he may never see the Forest again, and says of Park

> "'s oil leam caradh na frithe
> .....
> Bhith fo bhion aig na bodaich
> D'am bu chosnadh cas-chrom."

"I deplore the state of the forest ..... that it should be in subjection to the carles whose livelihood is a cas-chrom" (foot plough - literally crooked spade). The song gives no indication of numbers, and unfortunately no rental of this period is extant.[2]

17 From rentals and other evidence, Park was the last area in Lewis to be colonised in permanent settlement; the fact that the population of Lochs parish increased from 912 in 1755 to 1350 in 1801,
[161] supports the view that the late eighteenth century saw the extension of modern settlement in Park.

[127] The first documentary evidence of settlement in the present crofting area is the Judicial Rental of Lewis, taken by the Forfeited Estates Commissioners in 1718. This rental records tacksmen, or major tenants, living in Habost, Seaforthhead, and Eilean Calum Cille - all situated along the southern shores of Loch Erisort: there is local tradition that Kershader and Marivig were shielings

1 The editor is indebted to Miss Bridget M. Gordon, B.A., B.Litt. for an analysis and evaluation of the place-name evidence - see Appendix C.

2 For this extremely interesting information and the translation, the editor is indebted to Mr. William Matheson, M.A., of the Department of Celtic, Edinburgh University.

102

Fig. 2. Clearance and Resettlement in Park
/Facing p. 3/

17 or summer pastures for the tenants of Laxay and Barnish respectively, townships on the north
175 shores of the loch. In 1775, there were four tenants in Kershader, but their place of origin
162 is unknown. In 1805, five tenants are recorded, two of them from Uig; by 1824 there were 10
34 tenants. Thus the growth of population in Lewis during the second half of the eighteenth century
311 may well have been the major reason for the colonisation of one of the least agriculturally
161 attractive districts of the island.

From Figure 1, which shows most of the thirty-four occupied places south of Loch Shell about 1828, it is evident that colonisation had extended south into the mountainous area. The evictions, which commenced in Harris in 1816, may have increased the population already there as early as 1660, for many of these families came from Harris. The numerous shielings in South Park speak of a vigorous community: it is possible that South Park was more densely populated than the northern area up till 1800.

162 During the period 1818 to 1842, when the grazier, Donald Stewart, and his brothers had a lease
175 of South Park, most of these settlements were cleared (Fig 2): in addition, between 1838 and
361 1843, 68 tenants and sub-tenants in Shieldernish, Cleiter, Seaforthhead, Lemreway, Oronsay,
311 Stiomrabagh and Isginn were removed, in all about 436 people.[1] Some 27 families were sent to
161 Crossbost in North Lochs; others went to Tolsta and Tong in Stornoway parish, and some emigrated. The main body of those evicted settled in the townships in North Park: Marivig in 1838 had 6 tenants; by 1850, 22 are recorded. Thus the present distribution of population crystallised about 1840 and by then the townships along the shore of Loch Erisort from Habost to Garyvard were well established. The Minch coast townships from Cromore to Gravir, first settled about 1800, were greatly expanded, and Park south of Gravir became a sheep grazing devoid of small tenantry.

175 In 1844, the Seaforth family, which had held Lewis for over two centuries, sold the island to
423 Sir James Matheson. The estate management soon wrought great changes in the landscape. Until
311 1850-52, the run-rig system prevailed, a system whereby a group of joint tenants, or a tacksman
361 and subtenants, cultivated in small patches what arable land had been reclaimed, each share
241 being periodically re-allocated. The crofts, or individually held land, date from 1850-52, when the land was lotted and most of the present crofts were formed at this period. The settlement pattern associated with run-rig was one of closely nucleated groups of houses but when run-rig was abolished, houses were built on the individual crofts.

175 In 1858, Lemreway was once again made available to crofters, most of whom came from the
162 fishing townships where population pressure was building up. After the disastrous potato famine
433 of 1846-7, and the final failure of the kelp industry from 1840 to 1844, the population of the Outer
731 Isles experienced great hardship. By the early 1850's, the lotting of the crofts and the rapid
228 development of the fishing industry brought a period of prosperity and the population grew rapidly
161 especially in the fishing townships of the Minch coast. The prosperity was such that numerous cottars built houses on the lotted crofts, and their stock-keeping on the common was tolerated because of the demand for fishing crews. About 1884, the system whereby each boat was tied to individual fish merchants, who advanced meal and provisions against the catch, was discontinued. When this system was replaced by the auctioning of catches, such was the privation in Lewis that the Royal Commission investigating the poverty of the population in 1888 found conditions almost as severe as those prevailing during the potato famine forty years earlier. It was during this period that the Park Deer Raid occurred: Park became a Deer Forest in 1883 at the end of the grazier's
[685] lease. In 1888, as a demonstration of their grievances, a large number of crofters from the Park townships went into the Deer Forest and killed about 200 deer, cooking the meat in the open for all to see. Some were arrested but after trial acquitted.[3] A few good fishing seasons remedied this unhappy situation and the population of the fishing townships rose to a peak in 1911.

Fig. 3. The Crofting Townships of Park

/ Crofting p. 4 /

175 While the Royal Commission of 1883-6 was investigating Crofting conditions in Scotland, the
423 farm of Seaforthhead and Shieldernish was restored to six crofters. Six years later, the Royal
311 Commission of Enquiry into the Highlands and Islands scheduled the following land as suitable for new crofting townships: Stiemreway, Eilean Calum Cille, Crobeg, and the islands of Orosaidh and Rossaidh, a total area of 153 acres arable and 3,502 acres grazing. A further 165 acres of arable and 40,135 acres of grazing in the Park Deer Forest were scheduled as land suitable for the extension of existing holdings. The Report of the Commission considered "that in the case of Lewis, it cannot be left out of view that the congestion is very great, and the demand by crofters for access to lands now scheduled is of a very urgent nature ..... The Deer Forest Commissioners do not believe that the lands now scheduled are suitable for new holdings: but were these lands occupied as common pasture by crofters, under a properly adjusted system of management, their occupation would be of much advantage to the occupants and more than outweigh the disadvantages."[6] As a result of this recommendation, the islands of Rossaidh, Orosaidh and Iubhairt, in all 90 of the 43,728 acres scheduled, were given to Marivig, Calbost, and Lemreway, respectively, as additions to the common pastures; the sheep farm comprising Crobeg, Oronsay and Stiemreway, and the Deer Forest were left undisturbed.

175 In 1924, after raiding, Oronsay was reconstituted as a crofting township, all but one of the new
423 tenants coming from the overcrowded crofts of Lemreway. An unsuccessful attempt was made by
632 squatters who had built houses at Stiemreway, to have their unofficial lots recognised, but some
311 families remained there till 1945. In 1934, fifteen small lots were cut out of the Gravir common
[163] pasture to relieve pressure on the Gravir crofts: this Department of Agriculture scheme marked the end of a century of population redistribution.

Thus the full recommendations of the Deer Forest Commission have never been implemented, but one can only conclude, after a study of the crofting economy, that greater participation by the crofters in the Deer Forest grazing would bring increased viability to the crofting community.

175 The landscape of Park has thus experienced four formative periods. Of the prehistoric era and
162 the early historical period, when the Norsemen held sway, a few archaeological sites and a large
361 number of place-names remain. From 1660 until the early nineteenth century settlement was
632 slowly established and spread over all the coastal fringe: this period saw the maximum areal distribution of the small tenantry. From 1828 to 1843, eviction stripped the entire area south of Gravir and west of Habost of population, and large scale sheep farming was extended at the expense of the small tenants. The fishing townships from Cromore to Gravir were greatly expanded at
[161] this time. From 1858-1924, three of the cleared townships were reconstituted: the population in the majority of the fishing townships continued to grow till 1911. Since 1924, fifteen new lots have been formed in Park but the population has progressively declined.

The absence of large scale resettlement since 1886 differentiates Park from most other crofting districts, but the exodus of population since 1918 and the existence of a population constantly struggling for viability in an area deficient in resources are features common to the entire crofting area.

THE PATTERN OF CROFTING

427 Crofting, a distinctive system of land tenure, is confined to Argyllshire, Inverness-shire,
241 Ross and Cromarty, Sutherland, Caithness, Orkney and Shetland, the seven Crofting Counties of
178 Scotland. Small agricultural units sharing rights in common land, usually pasture but in some
423 districts arable land also, survive in 151 out of the 163 parishes, and these holdings form the
477 nearest equivalent to peasant communities in Britain, although only a small minority of crofters own their holdings, and the true subsistence element, implicit in any definition of peasantry, has all but disappeared.

175 Before 1886, the crofter was a tenant-at-will, with no security of tenure, and no right to
427 compensation for improvements. The Crofter's Act of 1886, defined a croft as an agricultural
241 holding in a parish where there existed, or had existed, rights of common grazing, and where the
423 annual rent paid was less than £30. Security of tenure, and compensation for improvements were the main provisions of the 1886 Act; the rent qualification was later raised to £50. In all, there are about 20,000 crofts in Scotland today[1] and Collier[2] estimated the crofting population at [61] about 100,000. The number of crofts in Park is 215, with population of 908. Thus Park forms [62] a 1 per cent sample of the crofts, and a 0.9 per cent sample of the estimated crofting population.

Crofting Organisation, Layout, and Settlement.

423 The characteristic settlement unit is the crofting township: Figure 3 illustrates the areal
427 distribution of the 12 townships in Park. Each township comprises two main elements, the
061 individually held croft land, and the common grazings. The number of crofts per township
311 ranges from 6 in Caversta to 43 in Gravir.

632 The individually held croft land (1,839 acres) is partly 'outrun' or permanent pasture and the
233 holdings are usually but not always consolidated - in Gravir (Fig. 4) and Cromore some of the crofts comprise as many as five non-adjacent pieces of land. Each croft is normally separated from neighbouring units by a drystone dyke or fence but in Park, such demarcation is the exception rather than the rule.

The croft land is separated from the common pasture by the township dyke, a stone or turf wall. The Park common pastures consist of 22,023 acres of moor grazing - generally very poor, ill-drained land with a large percentage of bare rock, areas of peat, and numerous lochs. In Park, only Oronsay common pasture is fenced, the limits of the remainder being faintly marked by crumbled turf dykes. Each croft has a defined right of grazing or 'soum' on the common pasture; the 'soum' is the number of beasts which may be pastured, a term comparable to the obsolescent 'gates' of northern England. In Gravir, the soum is 1 cow and follower or young beast, up to 6 quarters old (i.e. 18 months), and 8 sheep, per £1 rent. There is also a system of stated equivalences (Gaelic 'coilpeachadh') in most townships whereby substitution of cattle for sheep and sheep for cattle is permissible: in Gravir, the exchange rate is one cow for five sheep. Soumings and equivalences vary throughout Park. In former times, when a subsistence economy prevailed, soumings were enforced but nowadays the majority of the crofters do not even know the souming of their croft.

Fig. 5. Kershader - Land use. The inset shows the complete layout of the township: A - the Croft land, B - Re-seeded Grazing Parks, C - The inner fenced area of the common grazing. The former shielings belonging to each croft are also shown: the numbers correspond to the crofts numbers. (Redrawn from 1:2500 fieldmap by P.W. Wheeler, M.A.).

/facing p. 6/

427 Although the croftland is individually held, individual control of the crofts only applies for six
241 months of the year. After the harvest, the croft land reverts to common grazing and the whole
township stock graze indiscriminately over the crofts. Thus basically the whole area of the
[22] township, the individually held crofts and the common pasture, is common land, and it is clear
[42] that the agricultural revolution with its system of enclosure has not yet fully refashioned the Crofting
[176] Area.
[232]

175 Before 1900, there was a third element in the crofting landscape, the shieling (Gaelic - 'airigh').
233 The sites of the shielings are usually on slopes commanding a view of the surrounding area near a spring or stream and usually two to nine huts belonging to the same township are grouped together on a site; isolated shielings are rather rare. In order to conserve the pasture within the township dyke for wintering and to protect the unfenced crops, the cattle were removed to the hill early in June, and the younger members of the households went out to live in small stone or turf-walled huts to tend the cattle. The milk was either carried back to the township daily or made into butter or cheese at the shieling. The distance of shielings from the crofts varied from one to five miles in Park.

632 The affairs of the townships are managed by the Grazing Committee, elected triennially by the township and presided over by the Clerk of the Committee. The duties of the Committee in the past related mainly to the enforcement of soumings, but are now reduced to the disbursement of subsidies, although responsibility for the maintenance of the township dyke and the care of the township bull (usually lent by the Department of Agriculture but sometimes communally owned) are also the province of the Committee.

[361] The layout of the townships varies with the topography but the majority of the crofts are aligned
342 in strips from the moor to the sea (figures 4 and 5). Most croft houses are built on the crofts; in
[78] former times, the majority of the houses were sited on the poorest part of the croft as all the cultivable land was required for crops, but nowadays the houses tend to be sited near the road.

162 The official pattern of crofting is thus one of tenants, each living on his or her croft and sharing
361 in the rights and duties of the township. Table I gives an analysis of the tenants of the 215 Park
427 crofts. It will be noted that only one-fifth of the crofts are tenanted by those in the 15-44 age
241 group: a similar proportion are tenanted by those over 65 years of age. Absentee tenants account for 14 per cent of the total. Women form under 10 per cent of the total, but only one in seven of
[464] the women tenants is the sole labour force on the croft. The intrinsic worth of the holdings can be inferred from the fact that two-thirds of the male tenants in the insurable age group take supplementary work, two-fifths of them furth of Lewis. With such a large proportion of the tenants either fully employed in ancillary occupations in Park or elsewhere it is hardly surprising that the theoretical township organisation exists mainly in name alone.

427 Each croft, however, is not necessarily an agricultural unit; some are sublet by absentee
241 tenants or by tenants who are too old or too infirm to work their crofts. Of the 215 crofts, one-fifth are wholly or partly sublet. In addition to the legal crofts, there are unofficial holdings which fall into three categories, cottars, squatters and feuars, all legally without grazing rights. A cottar[1] is a person, usually a close relative of the tenant, who builds another house on

1 These are the de facto definitions. Section 34 of the Crofters' Act of 1886 defines a cottar as follows:- "Cottar" means the occupier of a dwelling-house situate in a crofting parish with or without land who pays no rent to the landlord, as also the tenant from year to year of a dwelling house situated in a crofting parish who resides therein, and who pays to the landlord therefor an annual rent not exceeding six pounds in money, whether with or without garden ground, but without
[113] arable or pasture land". For fuller treatment, see Scott, J., "The Law of Smallholdings in Scotland," 1933, pages 152-155.

There is no legal definition of a squatter, and the above definition does not include any distinction between houses built on a croft and houses built on the Common Grazings.

TABLE I

1. Of the 42 male tenants aged 65 and over, 31 are still active crofters, and of this 31, 16 are the sole labour force on their croft.

2. Of the 23 female tenants, 3 are the sole labour force on their crofts.

/facing p. 7/

427 a legal croft; a squatter builds a house on the common grazing, and a feuar pays a feu-duty or
241 ground-annual to the proprietor. Such unofficial holdings with stock on the common grazing are "agricultural units" in the same way as the crofts, for in fact some cottars keep more stock than the crofters. In these classes are 84 families and 32 of them keep stock. Thus instead of 215 legal units, there are 219 working units[1]. The more usual situation in depopulated crofting areas, where the number of agricultural units is much smaller than the number of crofts, is certainly not prevalent in Park. The official pattern of crofting and the real pattern are very different indeed both in Park and throughout the Crofting Area.

Crofting Agriculture

241 By definition, the function of crofting is agricultural production. The small area of cultivable
433 land, the poverty of the immature soils and the inhibiting characteristics of the climate, severely limit the range of crops. Of the 1838 acres of croft land in Park, less than 400 acres are classed as arable land. The measurement of the arable land was carried out about 1850 but reclamation after that date increased the arable area. Only in the townships of Shieldernish, Habost, Kershader, (Figure 5), and Garyvard where there are deeper deposits of glacial drift, is ploughing practised; elsewhere cultivation is entirely in 'lazy-beds', a system of narrow ridges 4 to 6 feet in width,
[242] separated by open drains, and cultivated by spade. Natural grass for hay is the chief crop, and and accounts for 52 per cent of the 638 acres of cropped land (See Table II). As only 400 acres of the croft land are classed as arable, some of this hay is taken from areas which were brought
[244] into cultivation after 1850. Oats (26 per cent), occupy the largest cultivated area, followed by potatoes (13 per cent). The small area of sown grass (9 per cent) of which four fifths is cut for hay, is symptomatic of the low standard of husbandry: only one fifth of the agriculture units sow grass. The average cropped area per agricultural unit is only 3 acres and only one-third of the units have gardens in cultivation. The hay and oats are grown for winter fodder, and the potatoes for household use. No detailed conclusions as to the use made of the crofts for cropping can be drawn, as the potential of each croft is extremely variable, but the low proportion of sown grass is indicative of the husbandry. There is a clear distinction between the 'agricultural' townships (Seaforthhead, Shieldernish, Habost, Kershader, Garyvard and Caversta), and the 'fishing' townships (Cromore, Marivig, Calbost, Gravir and Glengravir, Lemreway and Orinsay) in the extent and utilisation of the arable land: one measure of this distinction is that 55 per cent of the units in the agricultural townships sow grass; the figure for the fishing townships is only 22 per cent.

241 More valuable conclusions can however be reached from a study of the stocking. With the exception
427 of Glengravir township, each croft has a defined soum, and thus the stock entitlement for each
433 operative unit can be calculated. By using the equivalence, the soum can be converted to "cow units". In Gravir, the soum is 1 cow and follower, and 8 sheep per £1 rent: the equivalence is 1 cow to 5 sheep. The number of cow units per £1 rent is therefore 2.6; in the calculation, followers are ignored. The actual stock of the agricultural unit can also be converted to cow units and thus a comparison can be made between the soum and the actual stock of each unit. The percentage of the soum taken up can thus be used as an indication of the extent to which the unit is worked.

In the Crofting Area, as in all Highland Britain, stock rearing is the main function of agriculture.
[430] In Park, all the agricultural income, subsidies for cropping excluded, is derived from cattle and sheep.

1 Of the 215 legal units, 28 are sublet: thus if there was no unofficial stock-keeping by cottars and squatters there would be 187 agricultural units. However, there are 32 additional stock-keepers and thus in fact there are 219 agricultural units.

1. A legal croft is any piece of land registered as a croft - a tenancy may consist of one or more crofts. There are 615 tenancies.

2. Cottars, lessors, squatters with stock.

3. An agricultural unit is defined as any unit, whether a legal croft or a number of legal crofts owned and/or owned, or a cotter, lessor or squatter having stock. Agricultural units may include crofts in other townships worked from the home unit; the areas and acreages of such crofts are added to the township from which they are operated and subtracted from the township in which they are situated.

4. See page 3 for definition.

5. Some tenants in the townships of Deaforthead and Ghoilderoich, Bohnet, Sordaidder, Garrvard, run grazing in Park Deer Forest and therefore this stock is not related only to their respective Common Pasture Holdings.

6. Arable and outrun are not statistically differentiated; in the totals, the proportions of arable to outrun in the other townships have been used.

231
241
311
433

/facing p. 8/

231 Cattle are kept on 162 of the 219 units; in all there are 180 cows of three years and over, 47 young cattle, and 110 calves. The usual practice is to suckle the calves, and sell them as soon as they qualify for the calf subsidy; lack of winter-keep is one of the reasons for this practice. [234] The breeds of cattle are mainly Shorthorn and Aberdeen Angus with a few Highland cattle. The other function of the cow is to provide milk for the household; households without a cow rely mainly on tinned milk. [232] Cattle are sold at the twice-yearly market held at Garyvard, but prices fluctuate greatly. The townships of Park certainly do not carry a full souming of cattle.

231 Sheep are more important than cattle in the crofting economy in Park. The breed is the Lewis Blackface, a small, lighter type of the Scottish Blackface breed. The sheep are pastured 239 on the common grazings in summer, and are grazed on the croft land in winter. [232] The standard of sheep husbandry is also low as few crofters dispose of cast ewes or have a defined breeding policy as all stocks mingle freely on the commons. The lambing percentage for 1958 was about 60 per cent and the number surviving in August compared to the total ewe stock was 52 per cent, [235] but it was generally agreed that 1958 was a poor year. A further indication of the quality of the sheep is that in the fishing townships, a ewe fetches from 35 to 50 shillings, and a lamb about 20 shillings locally. The low lambing percentage and poor prices can be partly ascribed to the lack of good grazing and to overgrazing, but disease and losses in a treacherous common pasture raise the mortality rate. In general the sheep are left to fend for themselves with a minimum of shepherding although the more progressive crofters hand-feed the ewes and hogge in bad weather.

The majority of the crofters in Habost and Kershader, and a minority in Garyvard, rent additional grazing in Park Deer Forest, paying a fixed sum for each sheep. Sheep from these townships fetch better prices; in the other townships a few wedders and fewer cast ewes are sold to the [236] Stornoway butchers. In many flocks, wool provides the only income from sheep.

It is evident from Table II that the sheep souming is greatly exceeded. In the calculations, ewes are taken as one unit, and 'other sheep', wedders and gimmers, have been calculated at half rate. On this basis, the overall sheep souming is exceeded by 70 per cent and in only one township is the stock comparable to the souming. Overstocking has been encouraged in crofting districts by the ewe subsidy which was in operation till 1956 and it is notable that the rise in numbers of sheep recorded in the Outer Isles coincided with the introduction of the Hill Sheep subsidy in 1938.[1] Overstocking is without doubt the chief reason for the high mortality rate in sheep. Calculation of the overall relation of the actual cattle and sheep stock to the soum shows that the common grazings of Park are overstocked by 14 per cent. It is, however, impossible to calculate an exact figure, as the number of sheep grazed in Park Deer Forest was not enumerated. It is also evident from the individual croft surveys that the cottars, squatters and feuars, who have no rights of grazing, have stock equivalent to 157 cow units or 12 per cent of the total stocking. Thus the crofts of Park are maintaining an average stock fairly close to the souming, but the cattle-sheep ratio of 1:28 is too low for proper management of the pastures.

In general, a low standard of husbandry obtains in Park but it is clear that the agricultural townships are much more efficiently operated than the fishing townships. Overstocking occurs in seven of the twelve townships and sheep stocks are, with one exception, higher than the sheep souming.

1 In Scotland as a whole, the number of sheep recorded declined from 8,007,134 in 1938 to 7,336,000 in 1955.

/p. 8-3/

Table III reveals that there are 177 agricultural units with a crofting; ten units are crofts in Glengrant without a crofting; and the remainder of the 178 units have no grazing rights. From this Table, it is clear that full stocking and overstocking increase with the size of the croft, the units of two acres and over, on the basis of stock carrying, would appear to be the most intensively worked. In all, just over half of the units take up their full crofting. Table IV gives an analysis of employment ancillary to croft work for 141 of the 178 units and it would appear that neither ancillary employment nor age is significantly related to the intensity of croft working. Table V points to the fact that more full-time crofters are to be found on the larger units but that less than one in four of the younger and more active men are full-time crofters. Tables III, IV and V underline the fact that the larger unit are also the more successful and it is significant that the larger unit are almost all on the better land in the agricultural townships. The average size of holding in the agricultural townships is now extra, compared with less than eight acres in the fishing townships, where the land is much poorer and the cultivable area much more restricted.

The trends in agriculture are illustrated by Tables VI and VII. The Crofters' Commission made a survey of the crofts through the medium of Estate Factors in 1883. From Table VI it is evident that the number of cattle was much higher at that time and that the cattle-sheep ratio in the selected townships was 1:3 as compared with 1:28 in 1958. Table VII gives agricultural statistics for the parish of Lochs as a whole, separate figures for Park are not available. Since 1913, radical changes in the crop and stock patterns have taken place. Some crops (tattis, turnips) have disappeared as a crop, and sown grass and permanent grass fad hay have since 1947 become the leading crops. Horses have all but disappeared, and the cattle-sheep ratio has risen from less than 1:4 to 1:29 for the whole parish. Since 1938, cultivation in Lochs Parish has declined by 35 per cent. Large areas of hay-land, no longer cultivated, are entering landscape signs of their changes; seaweed, the sine quae non for layabed cultivation, is no longer carried to the upper parts of the crofts. In fact, many of the crofts no longer use seaweed as a fertilizer.

From the foregoing account, it is clear that there are two major agricultural problems in Park, the lack of sufficiently large crofts with good arable land and the insufficiency of common grazing; these deficiences bring in their train the problem of overstocking, and the existence of uneconomic holdings.

The more progressive crofters, significantly resident on the better crofts of the agricultural townships, have shown how croft land can be improved by re-seeding and sowing down to grass, practices which could be fruitfully extended throughout Park. In addition, several townships by co-operative effort, have reseeded small areas of the common grazings with splendid results.

However it is clear that it is not possible for 219 viable agricultural units to be maintained on the present crofting area. The optimum size of croft which could maintain a family is a moot point, for the location and situation of a croft and the quality of the land and common pasture would all have to be taken into account in making an assessment.

This problem was referred to a practical agriculturalist who was asked to state what size of croft and number of stock would be required to provide an annual income of £300, excluding croft benefit (milk, eggs and potatoes consumed on the croft) and any costing for labour. To fulfill these conditions, one of the fishing townships was carefully analysed, and the expert came to the following approximations, assuming that the rules of good husbandry were in force after the croft had been brought up to a good standard of cultivation and re-seeding had been carried out where possible on the outrun and Common Pasture, and provided there was no overstocking, and that present favourable subsidies and prices continue:-

Size of croft: 6 acres arable, (3 in crop, 3 in sown grass), 18 acres outrun and rights in Common Grazing to carry:-

6 cows, 2 young cattle, 50 ewes, 12 wedders, 12 ewe hogs and a ram.

Income	£	Expenses	£
Sale of 1 cow, 5 calves, 10 cast ewes and 3 wedders, and 28 lambs say	224	Seed, ram, service of bull, grass, cut, potato and turnip seed, manures and hand feeding say	98
Sale of wool	33	Excess of income	300
Subsidies on cows, calves and cropping	141		
Total income	398		398

In order to work such a croft efficiently, the tenant could not take regular ancillary employment and would require the assistance of his family at busy periods. If such holdings were formed in the particular township studied, the number of crofts would have to be reduced to almost one third of the present. In Park as a whole, the agricultural units would have to be reduced to half of their present number. The better figure is only very approximate as it was based on general evidence. It is clear, however, that about half the viable agricultural units could be maintained on the present crofting area of Park.

From a detailed study of the agriculture of Park one can only conclude that the present crofting[1] situation is far from being an optimum one. Only reorganisation on a major scale could make crofting economic, and such reorganisation would have to be coupled with the development of a non-crofting sector of the community dependent on ancillary industry. The prospects for the growth of ancillary industry are discussed on page 12. Larger crofts might well evolve as a result of continued depopulation. In the meantime, a determined effort could be made in the spheres of re-seeding and pasture improvement, and in consolidating the existing non-adjacent pieces of arable land, and the creation of the sheep stocks, with an emphasis on quality instead of quantity, and the introduction of cattle. Narrowing the present 1:25 cattle-sheep ratio, are policies which could be followed with profit.

ANCILLARY OCCUPATIONS

In most crofting areas, ancillary employment is necessary to compensate for the low croft income. Total dependence on the croft for a livelihood had never been characteristic of many crofting areas except in times of privation. At the time of the abolition of run-rig, most crofters were not a greater population than the land could support, even at subsistence level, and as a result, most retiree, crofts were created smaller than the optimum size in order to give as many persons as possible a share in the land. First the kelp industry and at a later period fishing, resulted in sub-divisions of crofts, already too small, and the establishment of a cotter and squatter population. In the case of kelp, the landlord required as many hands as he could muster and in the hey-day of the fishing industry, the land was a secondary consideration as meal could be bought with the proceeds of the catches.

In Park, it is noteworthy that the most congested areas in 1883 were the fishing townships and that since 1931, when the decline in the fishing industry began, these townships have experienced rapid depopulation. The non-fishing townships have not experienced this rate of depopulation. In Park as a whole only 18 per cent of the total crofting population of non-viable age (15-64) are full-time crofters today - a striking confirmation of the fact that ancillary employment is necessary. However, not all such employment is available in Park: 47 per cent of the non-viable male population

1. Principal workers of crofts: most women take some part in the working of crofts, planting potatoes, haymaking and harvest work, peat cutting, etc.

/p. 10-c/

However, not all such
166 employment is available in Park: 47 percent of the insurable male population
167 leave the Hebrides to find employment; one third take seasonal employment, and two-thirds
464 permanent employment outside Park (See Table VIII).

Employment within Park

298 Table IX shows that opportunities for local employment are strictly limited. Weaving of
464 Harris tweed is the most important single source of employment. It is significant that those engaging in it are almost all crofters working in their abundant spare time. Weaving is an ideal adjunct to croft work as it is unaffected by weather or hours of daylight and thus can be performed during periods of agricultural inactivity. The vagaries of the Harris tweed market make the occupation precarious. Park is one of the more inaccessible areas of Lewis and the mills are apt to give their commissions to the weavers nearer at hand around Shiorowey when
178 work is scarce. Since 1952, the number of weavers in the fishing townships of Cromore, Marvig, Calbost and Grasir has grown from 11 to 22 and much of the credit for this is due to
228 the activities of the Plaire Association. Fishing, on the other hand, has lost ground in the same period: the number of fishermen has declined in these townships from 20 to 14[1]. Apart from
465 weaving, service occupations form the only other employment available, shop-keeping, fishing,
464 and road maintenance being the chief occupations in the service group. There are very few craftsmen: with such a small population, and the long established tradition that the crofter builds his house and is his own tradesman, there is little opportunity for a trained builder, joiner or even shoemaker to make a livelihood. The professional class is small and entirely composed of the minister and missionaries, the doctor and several schoolmasters.

142 There is little opportunity for women to find employment in Park, apart from nursing, shop-keeping and school teaching, and a few domestic service posts. (See Table IX).

Employment forth of Park

166 The persons in the 15-44 age group form the main body of those working away from home.
167 The distinction made between 'seasonally away' and 'regularly away' is that the former group
462 spend part of the year elsewhere, the men on whalers in South Georgia or with the Tay Salmon
463 Fisheries at Perth, or labouring on the mainland. The women are in domestic service, mainly
464 in hotels. A majority of the men in the latter category are in the Merchant Navy; in some cases women are in domestic service (See Tables IX and XI).

An interesting comparison in the 'regularly away' group exists between men and women in the professional classes (Tables IX and XI). The sample is small, but it is clear that more women than men attain professional status. The number of domestic servants, nurses, and merchant seamen is a reminder that the crofting districts provide a pool of labour for certain vital occupations, some rates too popular in Britain as a whole. In people alone, one can say that Park makes a distinct contribution to the fabric of the national economy and this contribution is much more apparent outside Park than within the district. At the same time a majority of those who are temporarily or permanently away eventually marry and settle outside the district and thus a most valuable section of the community is constantly moving southwards. Only 35 per cent of the men in the 15-44 age group are wholly resident in Park, and 46 per cent of the women in the same age group, a reflection of the poor prospects and utter inadequacy of resources on the most of the crofts.

1 The 1952 figures are abstracted from the Lewis Survey Report on part of South Loche.

/p. 12/

Types of ancillary employment

241 The question of the desirability of ancillary employment in a crofting district is often
464 debated. On the one hand, engaging in such work means less time for croft work and makes wholehearted participation in the agricultural life of the township a virtual impossibility. On the other hand, crofters who take ancillary employment are better able to make capital investment in their croft. Table IV shows that in Park, croft efficiency, as expressed by the scoring
000 to actual stock ratio, is not necessarily related to participation in ancillary employment. If the township is to be re-established as a working entity, a clearer dichotomy in the population seems desirable; those who wish to work the croft on a full-time basis might be given full use of the available land, and those who wish to earn their living in non-crofting employment could take out few charters for their houses. It is clear that the agricultural resources of Park are insufficient to maintain the present number of crofts as viable economic units but the problem of finding industrial employment for any large non-crofting population is very great.

184 The Plaire Association, in their keen search to attract industry, met with little response for
464 high freight rates and distance from markets made economic industrial coating well-nigh impossible. The Chairman of the Crofters' Commission has recently suggested that some of the Glasgow 'Overspill of "tradesmen and assistantsnaew" might find "an opportunity to prosper in the West Highlands and Islands" but even with Government grants for the establishment of small factories, it is clear that present freight charges would be a severe deterrent.

178 One possibility is that the fishing industry might be revived. In 1945, 16 large motor
228 vessels were fishing from the townships between Cromore and Grasir; by 1952, three boats remained; only one boat was still fishing in 1958. The recent Fishing Board Scheme guarantees a minimum livelihood. The major problem is the finding of the initial capital
452 required to buy and fit out a modern boat, at present about £20,000. Eighty-five per cent of this sum can already be found in the form of grants and loans from the Herring Industry Board but the remaining fifteen per cent or £3,000 is often the more difficult sum to raise. The Murdo Mackaiy (Rhodesia) Trust has offered assistance to a limited number of fishermen towards the raising of the £3,000[1], and this offer is a real opportunity. If fishing is not re-started soon in Park, few of the original fishermen will remain to instruct the new generation.

464 Tourism is an industry hardly developed at all in Park. Lack of running water has made
452 the householders slow to offer accommodation, but it should be remembered that there are city dwellers who are delighted to accept inexpensive accommodation away from the crowded resorts. Dr. Dig J.Anitman, in his "Human Geography of the Outer Hebrides"[2], states that this fact has made the Aaland'Islands prosperous, and believes that tourism on simple lines could be successfully developed in the Outer Hebrides. Tourism need not bring in its train the desecration of the Sabbath for people who are willing to journey far in search of a quiet holiday usually conform to local observances.

464 Unless new sources of employment are brought to Park, it is clear that ancillary employment must continue to be sought elsewhere. The higher 'spending standard' in industrial employment, and the opportunities to find entertainment in urban areas (factors often resulting from experience during school days in Shiorowey or National Service), militate against a large population of young people, but basically lack of employment and the uneconomic nature of the crofts are the real reasons for the high degree of temporary and permanent employment away from Park.

[Herabedes] [Garryard]

common grazings - 40 proved approximately correctly stocked - 40 cannot therefore provide much employment. Hence it is the standard of agriculture that must be improved. Since the land does not permit striking extension or improvement of the cultivated area, development must be directed towards improving pasture, with more re-seeding and controlled grazing familiar to land already described. All this, however, is of little avail if prices for cattle, sheep and wool remain low, or at least lower than prices prevailing on the mainland. The first priority, therefore, in the establishment of a prosperous agriculture is a guaranteed market outlet. Given this, it might become worthwhile to take steps to increase the carrying capacity of the crofts. It may be assumed that this would involve an all-round improvement which could give a firm basis to the economic existence of the community; until this is achieved, stability and continuity are out of the question.

GARRYARD

Gwenyth R. Page, B. A.

The landscape of the south-east coast of Loch Eriboll is a sombre and rugged one. The Quaternary ice sheets left in their wake troughs now filled by the sea loch, innumerable lochs covered in water lilies, a moraine of boulders and gravel, and expanses of bare rock.

Garryard is set on the fringe of this landscape on a 20 to 25° slope with the crofts aligned from the moor to the sea, on a mantle of drift. Here is the home of MacLeods, the Mackinnons, the Sutherlands and the Mackays. The crofters have adopted the practice of stalling their winter months on the croft, followed by an increasing tempo and variety of work during the rest of the year, in January or February the winter's work must be fed on hay or lose the battle to survive. In February there are preparations for the year's tasks, making repairs and improvements to the croft. Next month will find the crofter on the land, making or clearing drains and putting fences and dykes in order. The tempo of life quickens with the year. April sees the first sheep lambing, the land turned over, potatoes and oats sown. From mid-May, the sheep leave the crofts to fend for themselves on the common grazing. The following three or four months are times of tremendous activity on the moors when the peats are cut, to be stacked later, first in fours, then in eights, so that the wind may dry them. Hill eventually beehive-shaped stacks - some due for last high - can be seen near the peat banks in August. Then begins the wearisome task of carrying the peats home, all too frequently in unseasonable weather, since the peat moorings of Garryard are on the moors up to half a mile from road. Altogether some two miles of roads are needed to convey the villagers patronizing the coal concessions of Borrowby. Two crofters, however, cut peat on their croftc, whilst others have permission to cut from Cromore or Caverata common grazings close to the road. All the while croft work continues, varying from hoeing, weeding and cutting hay to the gathering of sheep for shearing. As there are no fences between the various commons, crofters must travel from one township to another, seeking their own. In August the lambs are weaned. Hay making generally ends in August and is completed before the harvest in September. By the time both oats and hay have been gathered in, the potatoes are lifted and the sheep are brought in from the common grazing about October 12th. The last sheep dipping takes place in November and is followed by tupping.

There are eleven crofts altogether, though one is divided, each portion having a legal tenant who has a half share in the common grazing. Two crofts are 12 acres in extent, the half crofts 2.75 acres only, though the acre cultivated on the common grazing by one of the latter crofters since 1925, has recently been officially recognized. Most crofts are in strips running from the sea-shore up the slope some 500 yards to the township dyke, and are clearly demarcated by fences erected just after the last war. Three crofts have additional strips whilst one croft has an extra strip belonging to another croft. The additional strips date back about 100 years to a time when the township grew rapidly as a result of crofters in southern Park. One croft is divided and worked in three separate parts as in other places for fourteen operative units in Garryard.

[Garryard]

Only a fraction of the croft land is cultivated by tractor and this is divided among seven crofters. In spite of an emphatic statement by one of these cultivators to the effect that he will never use it again, the use of the tractor will increase as soon as the young man who is prone to their neighbours its capabilities and as soon as the ley-beds are joined together, an improvement which has already taken place in Rabster. The main objective to the use of the tractor is the disappointed with the yield of the cultivated land, which was smaller than in former years when he had used the spade. The answer to this was given by one of the other crofters, in the establishment of a prosperous agriculture is a guaranteed market outlet. Given for example, waving. Six of the crofters practise a five-year crop rotation, sowing potatoes first, followed by oats under-sown with clover, then two years of ley, and finally a fallow.

An interesting experiment has been made in the direction of the improvement of two areas of common grazing land by the use of lime on the west side of the township, by aims of the crofters working together during the evenings. The work began early in Spring when 5 tons of lime, 10 tons of fertilizer, 2 tons of grass seed and 4 cwt. compound fertilizer were spread over the land. The grass seed was sown in July, the most favourable time for sowing since there is less danger of a drought than earlier in the year, and more convenient to the crofters. The sheep had been grazed off, ensuring and 250 of them were available to be driven back and forth over the land to tramp the seeds in. In theory this land should be ready for grazing early in the following year, but in practice it will be ready in November. It is planned to re-seed twelve acres in all.

Most crofters have a cow to provide milk for their own needs. The Black Poll bull at Gruvie is preferred to the other township bulls since it is the property common higher prices. Below are held in the district where per year, since on the old island sheep are the staple of the township, and once at Balallan. Prices for calves are normally better in Spring than at the autumn, nevertheless prices altered tend to be low. Even so, it is actually to the advantage of the crofter to part with the animal rather than bear the cost of taking it back to the croft and wintering it there. Naturally there is some bitterness that the middleman who purchases calves will sell them at much higher prices on the mainland at Dingwall. Sheep are normally sold in Borrowby to the butchers but also at the local sales.

Crofting is not in itself a lucrative form of employment and in most households there is at least one other source of income. A majority of the crofters have regular employment, two working in quarries or on the roads for the County Council, one is a part time crofter, working in quarries or on the roads for the County Council, one is a part time crofter, working in quarries or on the roads for the County Council, yet another works in Ardarroch waters aboard a whaling factory ship for eight months of the year. Weaving is undoubtedly the most lucrative of the subsidiary occupations. Though the weaver's are suffering from the slump in the Harris Tweed industry which is affecting the prices for wool. Contrasting is also a paying proposition for one or two persons who have been reclaimed by clearing heather and removing peat to farm the crofts, but the soil, which varies in depth from a few inches to a few feet, is very acid.

Almost crofters own a small rowing boat and it is not uncommon to see half a dozen nets set to catch mackerel and other demersal fish. There is not one large fishing boat, however, partly because of the scarcity of land in the township and partly because of the isolation of the area and because of the difficulty in marketing. The Flatwood trawlers are regarded as pirates in the township and have on occasion been chased off the grounds of two large boats, a dyke, border Tom Ladd, Mitsch, and one has to tie crofts the destruction of two long nets of gear lost in one night is ruin to a belonging to a local boat. To have eighteen pounds worth of gear lost in one night is ruin to a crofter-fisherman. Lobster fishing has died out at Garryard though it could be quite extensively pursued.

The main road from South Lochs to Borrowby through the village has obviously had a profound effect on the township. The sites of the old 'black houses' have been abandoned when new houses have been built, in favour of sites conveniently near to the road. The Road Age has greatly limited man's capacity for carrying goods. This is well illustrated by the fact that of fifty-nine and of crofters in Garryard not one possesses a creel, or carrying frame. Several old thatched houses are now used as barns and byres.

[Garryard] [Caverata]

At the moment Garryard appears to be a go-ahead village, carrying out communal schemes and well ahead of the township as a whole. However, the age structure of the population is abnormal since 60 per cent of the population is over 45 years. The future in Garryard affers young people a prospect of a mainland with little money and no entertainment, making the attractions of the cities and industries of the mainland very irresistible. Unless some means can be found to make life more attractive in the area, since more crofters are of the opinion that a weekly wage packet would more than compensate the loss of their independence. Perhaps it is symptomatic of the age of Mackay's Restaurant and subsidies that man cares more for momentary rewards and the luxuries of life. This is well understood by people who encourage their children to leave the islands to seek employment either in Britain or within the Commonwealth. The Lewisman is no sentimentalist clinging to dying traditions and a way of life. He presses his sons to leave the island for the mainland, the heather is variable for wintering the wood beyond the Hebrides and he is prepared to sheep on the wool, clipped in July, is sold to at lambing was exceptionally high owing to a prospect of a dry summer. The 1958 loss was. More than forty lambs and thirty ewes were lost by the township last winter, a number four or five times greater than the average loss.

Six cows, two heifers and four calves are kept in the township and tethered most of the year on the croft crofts. Calves are born throughout the summer months, but whereas early-born calves may be sold in the autumn, the majority of six months old, those born late are. The main part of Caverata is also open to question. Amalgamation of the crofts would not necessarily make more efficient units for the present units are not used to their full capacity. Amalgamation would mean that Garryard built at Hishost, but bull would produce a better strain.

In addition to keeping stock, oats are cultivated on five holdings and potatoes on six. The land has been built up into lazybeds about six feet wide and a foot high, separated by open drains, and is used and the acreage cultivated only amounts to three-quarters of an acre. Conditions are not naturally favourable for mechanisation at present, for the terrain is very uneven and broken up by shallow stream-stones exposed and a quarter of a mile.

Neither Toriota nor Caverata is on a main road. The former is served by a track joining the main road at Cromore, while the latter has a secondary road running as far as the township dyke, and an inferior one beyond. Cromore is the nearest village to Caverata, but it is not a good road within the dyke is a deterrent to the use of modern equipment and fertilizers. Byre manure is used on all crofts, but only three crofts have a supply of farmyard manure. Lime is brought from the shore and is used on the cultivated land. Artificial manures, Paraffin-size and lime have been reclaimed by clearing heather and removing peat to farm the crofts, but the soil, which varies in depth from a few inches to a few feet, is very acid.

The six legal crofts vary in acreage from 6.75 to 8.5 acres and a squatter has 5.5 acres of enclosed land. The township is in two parts: Toriota, with the two smallest crofts, lies at the east-ern extremity, while the other five holdings, also bounded by a dyke, border Tom Ladd, lie to the west. The sheiling, lies south-west of the township, the crofts, which run from the shore to the township dyke, were set prior to 1861; originally the township farmed part of Creag Farra. The legal units are, in fact, separate units except that one of the Toriota crofts, now unoccupied, is used for wintering lambs by the absentee's partners, a resident of Caverata.

There are no occupied black houses remaining in either Toriota or Caverata, as during the past fifty years new dwellings have been erected in dressed stone or corrugated iron, usually with roofs of asbestos slates, tarred felt, or corrugated iron. Several old thatched houses are now used as barns and byres.

[Caverata]

Each croft is fenced but has a gate giving access to the common grazing, in which each crofter holds an equal share. The township has no specially enclosed area for lambing or other purposes, and crofters open their gates for winter grazing. Breeding ewes are normally brought in for tupping in mid-October and November when crops have been gathered, lambing takes place, late March or April. After dipping and inoculation with vaccines for week of May.

The 642 acres of common pasture support a sheep stock equal to the sheep soum, but the overall stocking is only 88 per cent of the total carrying. Two crofts only exceed their individual soums, while the others are well below the number required for greatest efficiency. The grazing is, however, shaggy. Lewis Blackface sheep are the commoner, but there are also some Cheviots. The wool, clipped in July, is sold to Harris Tweed and the surplus ewes are sent to the slaughter house. The 1958 loss was 70 lambs and thirty ewes were lost by the township last winter, a number four or five times greater than the average loss.

The future position of the township is rather doubtful: it is not the best type of land for mechanisation and is badly served by communications. The future of Toriota appears to be probably one of abandonment, unless it is more easily linked with Cromore. The possibility of a good road being built here is remote, as there is only one family to serve. The main part of Caverata is also open to question. Amalgamation of the crofts would not necessarily make more efficient units for the present units are not used to their full capacity. Amalgamation would mean that Garryard built at Hishost, but bull would produce a better strain.

CAVERSTA

Helen Mackenzie

Caverata lies along a southern inlet of Loch Eriboll, five miles from the hinch and is partially sheltered from east winds by the Cromore peninsula and Ben Cleigh.

The physical nature of the terrain is irregular, rising steeply from the water's edge to a level of approximately 325 feet. To the west and to the east, the land slopes to the river estuary and is of a better quality than the central area. Here, the soil is very thin and rocky, separated by open drains, and is used and the acreage cultivated only amounts to three-quarters of an acre. Conditions are not naturally favourable for mechanisation at present, for the terrain is very uneven and broken up by shallow stream-stones exposed and a quarter of a mile.

Neither Toriota nor Caverata is on a main road. The former is served by a track joining the main road at Cromore, while the latter has a secondary road running as far as the township dyke, and an inferior one beyond. Cromore is the nearest village to Caverata, but it is not a good road within the dyke is a deterrent to the use of modern equipment and fertilizers. Byre manure is used on all crofts, but only three crofts have a supply of farmyard manure. Lime is brought from the shore and is used on the cultivated land. Artificial manures, Paraffin-size and lime have been reclaimed by clearing heather and removing peat to farm the crofts, but the soil, which varies in depth from a few inches to a few feet, is very acid.

The township comprises twenty-seven crofts and there are twenty-seven working units; two crofts are subdivided while another four farm double crofts. In addition there are five cottars and the Schoolhouse fee. Outside the township dyke there are two farm and four squatters. The croft layout differs from most other townships as each croft is in four non-adjacent pieces, one piece around the house, another above Creag Cromore and two pieces on southern ends of enclosed land on the common. Two crofts on the eastern side of Loch Cromore, have most of their arable land around the croft-house while three crofts have only one share in the other area of enclosed land.

Until the decade at the land around the house, and much of that above Creag Cromore, was regularly cultivated. Some of the lazy-beds on the higher land are being cut for hay this year but cultivation is limited to the land around the croft houses and is completely unmechanised. The only crops at present are oats and potatoes and these are usually grown in rotation. The crofters sowed

[Caverata] [Cromore]

The 1914-18 war had a marked effect on the Caverata population - 16 out of 54 (29 per cent) left after 1921 and the population continued to decline. Since 1939, seven people have migrated to Borrowby or the mainland, (16 per cent of the total 1939 population), and six of these were from Toriota (6.6. 50 per cent of the 1939 Toriota population), one was from the nearby cottar house. The demographic position is becoming more acute for there are no young marriage couples and no youngsters growing up. The girls have left to marry and most of the men have sought temporary or permanent employment elsewhere, for with better communications, education and the radio, the pull to the towns has become stronger. There are now only two people in the township who could be described as full-time crofters, earning no supplementary income by weaving tweed on commission from the Dromoway mills.

Caverata is not one of the most progressive of the South Locks townships. Although the crofts are fenced and have access to the common pasture in which each crofter has an equal share in the common pastures. At present, the grazing is fully stocked according to the soum, but the committee has not been very active. Most crofts have a share in the common grazing, but unless some change takes place, some newly sown grass would benefit every crofter. Lack of manpower may in part account for this deficiency but even a small acreage of re-seeding would be a great asset.

Fifty Shillings, situated on the common grazing between Calbost and Cromore, were used until the 1890's. Active land use has gradually declined: in the 1920's, much of the moraine was under cultivation and from an air photograph, it is evident that hay was being taken on the strips above Cromore in 1946. The present trend is a continuing decrease in the amount of arable land but the Cromore crofters have retained the strips and continue to use them for hay and for grazing. It is unfortunate that all crofters are not willing to take part. Peats are now being cut near the road between Caverata and Grastir, about three miles south-south-east of Cromore and one mile south of Caverata.

Cromore was once a prosperous fishing village but now it has no fishing boats. Two Cromore fishermen work on other boats (one from Marivig and one from Borrowby) and there are a few men who would welcome the opportunity to fish. The sheiling, well fished, was used until about 1950, however. The landing-stage, completed in 1937, is regarded by many as a 'white elephant' and, in fact, it is not in use. So much for the hopes that it might have been used by cargo vessels bringing goods to Park.

In Cromore there are fourteen looms for the weaving of Harris Tweed. Tweeds are obtained by road from two mills in Borrowby and one in Ardarroch. At present the demand is very slack and the weavers could quite easily double their production. During the past two years this industry has been comparatively prosperous. Knitting is a winter pastime but only one knitter, a widow, possesses a knitting machine.

In common with the rest of Park, Cromore has a high proportion of old people. Many from the middle age groups have sought employment on the mainland, and the teenagers, many of whom have left to attend in Borrowby, seek jobs there on the mainland, returning for holidays and assisting with the croft work. Some younger folk are resident to care of aged parents.

Cromore is only eight miles by sea from Borrowby yet all communications with the town are by road - a distance of thirty-two miles. There is a twice per week service and the sub-postmaster has a van by which is occasionally hired. Some people recalled that the only route to Borrowby was once by boat to Crossbost and thence by bus. One resident owns a lorry and this is used for most of the haulage in Cromore, particularly for bringing home peats during the summer. As a result of recent additions to the roads, only three crofts remain inaccessible to vehicular traffic. There are no shops in Cromore but grocery vans call on Monday, Tuesday, Wednesday, Thursday and Saturday.

[Cromore] [Marivig]

366 butchers' van calls on Wednesday and Friday and a fish van once or twice during the week. Goods
496 are conveyed by the daily bus. Electricity was brought to Cromore about ten years ago
498 and the inhabitants now look forward to a supply of piped water in about two years' time. At present
499 only three or four houses have bathrooms.

The crofts, when worked well, are good enough to provide the existing population with a satis-
500 factory subsistence, but each family unit must have some additional source of income. It seems
501 that the recent subsidies for flaking are good enough to attract fishermen from Cromore and one or
502 two boats might be sent out from the bay if the quay were longer. Weaving has brought prosperity
503 but, as the Park Association states in its Second Progress Report "there is not sufficient weaving
504 available for the present number of weavers". The proposal to establish a spinning and processing
505 plant in the Park District made in the 1957 Report, would undoubtedly be of great value to the
506 people of Cromore. The village is sited in a most picturesque spot and one of the inhabitants
507 suggested that a hotel built on Creag Fadhb would become popular in the summer. However,
508 even if these three increased sources of income became effective, one wonders whether they would
509 be sufficient to attract the younger generation, already urbanised by schooldays spent in Stornoway.

MARIVIG

Pamela Gough, B. A.

Marivig is situated on the western and south-eastern sides of Loch Marivig, a small triangular
151 sea loch opening to the north-east and sheltered from storms and swells by Torray Island, making
152 the loch an ideal anchorage and harbour.

The land rises steeply from the shore of the loch for twenty-five feet to fifty feet, then slopes
153 more gradually and irregularly, with frequent precipitous rock outcrops, for two hundred to
154 five hundred yards to rise steeply to a line of low hills, two hundred and fifty feet to three hundred
155 feet high, overlooking the loch. All crofts thus have an easterly or north-easterly aspect, not
156 particularly favourable for agriculture, and only one has any appreciable area of land not
157 uninterrupted by rock outcrops. Soils, derived from glacial drift, are unevenly distributed, thin,
158 and very stony, and cultivable areas are thus small and widely dispersed.

The surrounding hills, which form part of the eight hundred and sixty-three acres of common
159 grazing, are mainly covered with heather, moor grass or sphagnum bog, while the lower areas
160 within the township are grassy, but drainage is poor, and rushes are widespread. Bracken is not
161 yet a problem, and only small areas exist, mainly on the lower slopes of the western side of the
162 loch. A few rowans and willows survive here also, but otherwise the area is devoid of cover.

There are twenty-four registered crofts in Marivig, twenty-two being inhabited, one vacant
163 and worked by another crofter, and one worked from a house on the common. With the exception
164 of two crofts, one of which is on the common, all the boundaries run from the township dyke, which
165 closely follows the two hundred foot contour, to the sea in radial fashion. [Fig. 4] The size of the crofts
166 varies from 1.25 acres to 22.25 acres but only seven crofts and less than four or more than eight
167 acres in size. No croft has more than three acres of land which has ever been cultivated, and
168 few now cultivate more than one acre. There are thirteen cottars and squatters, five houses being
169 on the common, three of them cultivating small areas adjacent to their houses.

Cultivation is exclusively by spade on the 'lazy-bed' system. Owing to the rocky nature of the
170 terrain, the 'lazy-beds' are narrow, often only one or two yards wide. Potatoes and oats are
171 grown in rotation, and hay taken from lazy beds left fallow. Very few crofters now graze for hay
172 on undersown their crops. Dung and seaweed are used as fertilisers, with potato fertiliser as the
173 most general 'artificial'. Small enclosed gardens, often somewhat neglected, produce lettuce,
174 carrots, cabbage and soft fruits on about half the crofts, but no garden produce is marketed.

[Marivig]

There are only fifteen cows, two yearlings and four calves in the township, and the crofters with
[illegible] no cow rely on neighbours, or on tins, for their milk supply. All but two of the crofters keep
[illegible] sheep, there being about one hundred and eleven ewes, one hundred and eighty-five sheep and two hundred
[illegible] and thirty-four lambs belonging to the township. The common grazing, which is shared with
[illegible] Ardtalnaig which are grazed by five different crofters each year) is used for the sheep in summer, while
[illegible] all but one of the crofters winter their sheep within the township dyke on the croft. Most crofters
[illegible] keep hens, and surplus eggs are sold to the Stornoway van.

Peats cut on the common are transported by lorry to the crofts, while peats from the north end of
[illegible] the peninsula separating Loch Marivig from the sea must be carried in creels.

Nearly every crofter owns a rowing dinghy which is moored in the loch off the end of his croft,
[illegible] and with this supplemente the family food supply. One herring boat, operated from Port Mhor Stornoway
[illegible] and returning to Marivig at weekends, is all that is left of a fairly large fleet which operated
[illegible] before the war. A second boat, owned for years by one family, has rotted away on the beach, and two others
[illegible] are wrecks. Over fifty years ago there was a curing station at Marivig. One crofter fishes lobsters
[illegible] during the winter and markets them in London.

Of the other crofters, only two supplement their incomes by weaving, one by working on the
[illegible] roads while several men work partly on the crofts but are particularly away from home during the busy
[illegible] fishing, or on hydro-electric schemes. Several others are in the Merchant Navy. The gradual
[illegible] migration from Marivig, especially of the young people, is reflected in the high average age of the
[illegible] permanent residents, and in the numbers in the school -over one hundred pupils in 1900, thirty-nine
[illegible] (including sixteen from Calbost) in 1946; but only nine (none from Calbost) in 1958. The young
[illegible] people leave the township to train or work on the mainland (generally in Glasgow) and, if not in Stornoway,
while their elders accepted from the view that "there is nothing for the young people here".

The township has a Post Office and telephone kiosk which also serve Calbost, while lack of a
[illegible] shop is partially compensated by a choice of four vans from Stornoway and one from Gravir. There
[illegible] is a daily bus from Gravir via Marivig to Stornoway and back: the return is over 10/-. The road
[illegible] which reached the township from the west in the late 1920's has a fibred surface and is much
[illegible] better than the later road southwards to Gravir which is untarred. There is no church in Marivig
[illegible] and most of the population attend the Free Church in Gravir.

Within the township the farms of the township road serve all but two of the crofts and the
[illegible] sites of the newer houses, few of them more than thirty years old, tend to be near the road, while
[illegible] the ruined houses found on most crofts are often nearer the sea. Only two thatched houses
[illegible] and the other inhabited houses are built of stone roofed with asbestos slates, or corrugated iron.
[illegible] All the crofts are supplied with electricity from the grid, but very few have a piped water supply
[illegible] rainwater is collected from the roofs and piped for washing, with a separate piped supply from a
[illegible] well for drinking. All other houses draw water from wells.

The stormy winter weather, rocky terrain and poor soil are all blamed by the residents for the
[illegible] drift of population away from the crofts, but those who remain have little incentive to work the
[illegible] crofts more efficiently owing to the very hard labour involved. It is suggested that with more
[illegible] intensive cropping and more cattle, each croft could make a comfortable profit and surplus milk,
[illegible] potatoes and eggs could be marketed in Stornoway - the milk especially being that at present brought
[illegible] from the mainland. Such development, perhaps on a co-operative basis, together with a revival
[illegible] of the fishing industry and introduction of a tourist industry, by building a small hotel or guest
[illegible] house and attracting anglers as well as those who simply wanted scenic beauty, might bring pros-
[illegible] perity back to a township which otherwise may well be derelict in the next twenty years. But the
[illegible] capital required for the two latter enterprises is not available within the township.

[Marivig] [Calbost]

In conclusion, it may be said that the problem of Marivig's future, and that of other crofting
[illegible] townships is not one of adverse assets, but of adverse economic, well and weather conditions, and of distance from
[illegible] markets, but a problem of the population finding a stable and viable level where agricultural units
[illegible] are large enough to encourage the active and enterprising section of the population to remain, and
[illegible] a problem of finding capital to equip a modern fishing fleet.

CALBOST

Anne Cheyer

Calbost is situated five miles to the north-east of Gravir on the Minch coast of Park. It occupies
[illegible] a basin-like hollow in the centre of which is Loch Dubh, and is open to the sea on the east. The
[illegible] croft houses are scattered over a shelf 150 feet above sea-level round the sides of the hollow and
along the valleys which enter the township to the north and south-west.

The cultivable soil, a mixture of peat and well-drained gravelly drift, is on the higher ground,
[illegible] although here the rock outcrops in many places. On land formerly cultivated, bracken is spreading
[illegible] rapidly and now covers a large proportion of the surface, although twenty to thirty years ago it
[illegible] was unknown. Heather dominates the common pasture and rushes are widespread in the low-lying
[illegible] central area. There are a few willows and rowans round the old buildings, probably planted as
[illegible] wind-breaks.

Calbost was originally a single farm but the township was formed about 1820. The pattern of
[illegible] the crofts differs from the usual shore-to-dyke alignment, as six crofts were allotted extra land
[illegible] in the valley which enters from the north, when a part of the common grazing was brought within
[illegible] the township dyke. There are now fourteen crofts of which four are worked by resident crofters
[illegible] and two by squatters. The remainder are used only for hay and grazing and are sub-let to crofters
[illegible] in Calbost and other townships.

Cultivation is entirely by spade and of the 2. 6 acres now in cultivation, potatoes account for
[illegible] 2. 37 acres. The small acreage of oats reflects the greatly reduced cattle stock of only two cows and
[illegible] two calves. Approximately twelve acres of hay are cut as winter feed for the 225 sheep which graze
[illegible] in the township.

The lazy-beds in natural hay and the outrun are being rapidly encroached on by bracken. The
[illegible] presence of bracken, and the amount of work needed to clear it, is likely to deter any attempt at
[illegible] renewed cultivation.

Calbost was originally a fishing township in spite of its harbour being no exposed: boats have to
[illegible] be taken up on the shore instead of being moored in the bay. The decline of the fishing industry whic
[illegible] has prevailed in Lewis has contributed towards the almost complete depopulation of Calbost. Leaving
[illegible] only a few houses now used only for leisure purposes. Croft income is supplemented by only two of
[illegible] the men in the township, one a weaver and the other in the Merchant Navy. Although there are a few
[illegible] productive gardens, no surplus is made to market any produce.

The township dyke is very close to the settlement and in the past shielings were not so widely use
[illegible] in Calbost as elsewhere. The cattle were instead brought near to the dyke for milking and allowed
[illegible] to graze on the common unattended. There are ruins of shielings to be found on the hills around
[illegible] Calbost but a more interesting feature is the second dyke; enclosures were made adjoining the main
[illegible] dyke and in the summer the cattle were brought to fresh pasture within these dykes before
[illegible] the opening of the township gate. Following the opening of the gates the stock are free to wander
[illegible] over all crofts but there seems today to be a move towards the complete enclosure of the crofts.

[Calbost] [Gravir] [Glengr-vir]

[illegible] The present population situation in Calbost is best illustrated by reference to the population statistics.
[illegible] There are only 17 people living there at present, seven of whom are squatters and only eight houses
[illegible] are occupied within the dyke. Of the male population, there are three children under fourteen years,
[illegible] one aged 15, one aged 17, one aged 20, three between 45 and 54 years and one over 70. This clearly
[illegible] shows the lack of active men from 15-44 years, necessary for the continuing economic success of
[illegible] the community. However, even these figures are not as striking as the numbers of emigrants as
[illegible] no less than 39 men and 40 women have left Calbost since 1939.

A community of 120 persons has shrunk to less than 20 in only twenty years as the younger
[illegible] people have left to find employment in Stornoway and on the mainland. The present population
[illegible] structure seems to indicate a continuation of the downward trend.

GRAVIR AND GLENGRAVIR

Gravir, the largest Park township numerically in population and crofts, lies astride the major
[illegible] east-west inlet of Loch Ordais, a glacially modified line of structural weakness. The site of the
[illegible] township is thus one of the most picturesque in all Park, but the steep slopes, lack of cover, the small
[illegible] area of good arable land, and the considerable population existing on quarter have under fifty per cent of
[illegible] the soil in arable, which is not all cultivated in any year.

On the south-facing slope above the loch and the continuation of the trough to the valley to the
[illegible] west, the majority of the crofts have been carved from moor to ass, some before 1800, and some
[illegible] in the process of the abolition of run-rig which was accomplished in the years 1850 to 1852.
[illegible] Originally, there appear to have been thirty crofts, but four were added during the nineteenth
[illegible] century, two at each end of the line, and in 1934 a further fifteen were cut out of the common grazing. A road to the west of Gravir, on the south side of the loch, the village of Port Mhor, was built and
[illegible] established about 1800, has since developed into a further nine crofts. Thus there are forty-three
[illegible] legal crofts in Gravir and a further fifteen in Glengravir making fifty-eight in all.

The layout of Glengravir, a line of crofts from 3. 6 to five acres, typifies the small post-1918
[illegible] Department of Agriculture holdings. The arrangement of the Gravir crofts is illustrated in Figure
[illegible] 6, and it will be seen that not all the crofts are consolidated. There are three areas of former
[illegible] arable cultivation which have been intermixed with unfenced strips and lazy-beds, the latter which
[illegible] were necessary to supplement the food producing capacity of the holdings. The method of division
[illegible] of the arable appears to speak of a period when a substantial economy under secure tenure provided
[illegible] population, necessitated fair shares for all. The last of these commons was in cultivation until
[illegible] 1891. Although substantial cropping has been obsolete since then, there is as yet no move towards
[illegible] renewed cultivation of the layout.

The congestion which necessitated the reclamation of the arable commons developed mainly
[illegible] as a result of a successful fishing industry which prospered from 1860 to 1914 and at one time there
[illegible] was even talk of a harbour in Gravir. With relative prosperity from an ancillary industry, cottars
[illegible] were tolerated and the population rose from 197 in 1830, to 368 in 1881 reaching a peak of 468
[illegible] in 1911. The collapse of the industry after 1914 began the downward trend which has certainly not
[illegible] yet ceased. Gravir received from 1918 to a township of agriculturalists and a base for employment
[illegible] forth of Lewis, although there have been spasms of successful fishing activity since.

Stock raising is now the function of the township and the agricultural resources and conditions
[illegible] are hardly conducive to the development of economic holdings. The Gravir and Glengravir crofts
[illegible] vary between 3. 5 and 26. 5 acres in size: no croft has more than four acres of 'old arable'. In the
[illegible] days of subsistence agriculture, and indeed until the 1930's, cultivation, all in narrow lazy-beds,
[illegible] banked up with stones at the downward extremity on the steep slopes, was much more extensive.
[illegible] All the cultivable land was at one time under crop, heavily manured with seaweed cut as far away as
[illegible] Cromore or the coast south of Kebock Head. About one-third of the maximum lazy-bed area is now
[illegible] cropped and the more inaccessible areas of the crofts have reverted to pasture; some of the lazy-

[Gr-viz] [Glengr-vir]

[illegible] beds are now covered by sphagnum moss and heather. Other lazy-beds are permanently in natural
[illegible] hay: only about one-third are cultivated at intervals of two years in rotation and grazed. The
[illegible] natural hay is added, one hundred and thirteen acres of crops are taken from an area greater than
[illegible] the so-called old arable, this suggests that the cultivated area was greater in the past than the
[illegible] old arable (ninety acres) after 1850-52. As in all the fishing townships the area of sown grass is
[illegible] infinitesimal for only four of the fifty-eight operative units actually sow grass. The wintering
[illegible] capacity of the crofts could be greatly increased by the general adoption of the practice of under-
[illegible] sowing.

There are forty-three legal crofts in Gravir but nine are sub-let, in every case to relatives.
[illegible] All the crofts are taken up and there is evident pressure of population on the land. In addition
[illegible] to the crofts, there are a further ten cottars, and squatters and feuers, besides the fifteen legal
[illegible] Glengravir crofts (ten operative units) which have no share in the Gravir common. The common
[illegible] grazing is shared with Calbost, Port Mhor, Marivig and Ardtalnaig, and the Gravir crofters and the
[illegible] Church of Scotland and Maldie, the doctor, one of the two district nurses and two of the missionaries
[illegible] (assistant ministers) are all located in Gravir.

Gravir and Glengravir thus have fifty-eight legal crofts and fifty-six operative units. Less than
[illegible] half of the crofts with grazing rights are fully stocked and one quarter have under fifty per cent of
[illegible] the soum, including five without any stock. The common pasture of 2,652 acres is in general of
[illegible] poor grazing quality, dominated by the less nutritive species of grass and poorly drained. In 1957,
[illegible] a ten acre plot was fenced and re-seeded: only twelve of the operative units participated in this
[illegible] reclamation scheme, and the age of the participants ranged between 40 and 70 years, this is sig-
[illegible] nificant as aged tenants are unable to carry out such work. This scheme could be extended
[illegible] annually; if potential improvements to the crofts are limited, pasture amelioration is virtually
[illegible] without limits. Re-seeding on a large scale would enable better stock to be kept rather than greater
[illegible] numbers; at present the sheep stock is over two hundred per cent of the soum, and a ewe and
[illegible] lamb sell for only little as £2 10s to £3 10s, an indication of the consequences of over-stocking. The
[illegible] cattle stock is below the souming and this paucity of cattle is one of the notable changes in the agri-
[illegible] culture since the 1930's for at that time as many as six cattle were kept on the larger crofts. The
[illegible] total stock kept in Gravir and Glengravir exceeds the souming by thirty-five per cent.

The great majority of the crofts can certainly not be considered economic units. Judging from
[illegible] the souming of crofts in Glengravir, the average croft in a township where
[illegible] only seven crofts pay more than £2 rent, they were never intended to be self-supporting agricultural
[illegible] units. The produce of two cows and sixteen sheep, with potatoes, and in former days, hens or oats,
[illegible] could be had by three Gravir crofters, only twelve operative units could exactly qualify.
[illegible] Fishing was the complementary economic activity, and in 1901 no fewer than nineteen boats and
[illegible] eighty-six fishermen were registered at Gravir. Today, only one boat fishes commercially for
[illegible] lobsters.

If agriculture is singularly unrewarding, weaving occupies six of the males of insurable age and
[illegible] service occupations a further ten males and five females, but neither weaving nor service occupation
[illegible] are sufficiently numerous to have any appreciable effect on the insurable population in the district. Twelve of
[illegible] the males between fifteen and sixty-four years take seasonal employment and forty-six are in
[illegible] permanent employment forth of Lewis, in all sixty per cent of the potential wage-earning population.

The economic problem of Gravir, in common with the other 'fishing' townships, became acute
[illegible] after the fishing industry collapsed after 1914; in the hey-day of the fishing most of the men fished
[illegible] all the year round, locally and on the west and east coast of Scotland. Earnings fluctuated but a
[illegible] man might make as much as £90 in a good year or as little as £5 in a poor year. Apart from the sa-
[illegible] of young cattle, and wool surplus to home spinning requirements, the fishing earnings constituted
[illegible] the bulk of the croft income. Today, on the basis of the souming, the income of the largest croft
[illegible] including subsidies could only be approximately £150 excluding the amount to be set aside for home
[illegible] consumption of potatoes and milk.

LEMREWAY

Distribution of work through the year

FIG. 9

(facing p. 31)

POPULATION

161 Figure 6 and Table XII give the population of Park from 1830 to 1958 in graphical and
162 tabular form. The 1830-51 decline was due to evictions. The rapid increase in population
[228] from 1861 until 1911 can be almost wholly ascribed to the success of the fishing industry: a comparison of the graphs of the selected agricultural and fishing townships makes this clear. The decline since 1911 has been very rapid, and is mainly a reflection of lack of ancillary employment. The 1939 figure in the graph appears to show a slight check in the rate of decline but it may be that there was an influx of evacuees from Glasgow just before the enumeration was made.[1] The 1951 Census confirmed the continuing downward trend as did the enumeration of 1958.

An investigation of the age structure of the population (Table XIII and Figure 7) reveals that not only is the population declining but also that it is ageing. In 1958, only five per cent of the population were under school age, as compared with 9.4 per cent in 1939. The largest single group in 1939 was the 15-44 age group, the most enterprising and energetic members of the community; in 1959, the 45-64 age group emerges as the largest. The 65 and over age group has increased by 5.2 per cent since 1939.

As the 1939 and 1958 enumerations were not obtained under the rigid conditions of the Census, the figures for Lewis, excluding Stornoway Burgh, have been added for comparison; unfortunately the published Census material does not give individual parish statistics in age groups for Lewis. By including those persons in seasonal employment (mainly in the summer months) and excluding those permanently away, the Census and enumeration figures are more comparable, but it is possible that in the enumeration there may be an error of five per cent. (See Table XX). From these comparisons, it would appear that the population structure of Park is unbalanced in comparison with the rest of rural Lewis, and Scotland as a whole. The reason for this is the fact that so many people are working permanently away from home. (See Table XI From a study of the population structure it is clear that Park has all the attributes of an ageing population, a significantly low proportion of children and a higher proportion of the 45-64 and 65 and over age group than either rural Lewis or Scotland as a whole.

166 An attempt was made to record migration from the townships since 1939. From Table XV
167 it is clear that all migrants were not recorded in the enumeration but the discrepancy may be explained by two other factors. The evacuees from Scottish cities who returned after 1939 to their city homes may well account for some and more people may now be working permanently away from home than was the case in 1939.

The destination of the emigrants (Table XVI) is significant. Stornoway Burgh (32 per cent) heads the list and so many of the Park families have not left Lewis but have gone to the one place on the island where employment is available. The second largest group have migrated permanently to Glasgow; many of those in permanent employment furth of Park (unmarried and still part of the croft household) work in Glasgow, and eventually marry there. It is also significant that only 16 per cent of the emigrants settled in crofting areas. The fact that over one-third of the recorded migrants settled in the only truly urban community in the Outer Hebrides needs further investigation but one possible conclusion is that if employment were available in Park, the migration rate would be drastically cut.

1 For discussion of this point, and of the population statistics in general, the author is greatly indebted to R. S. Barclay, B. Sc., Ph. D., F. R. S. E.

[Seaforthhead]

161 Table XVII reinforces the idea that there is a striking dichotomy between the agricultural
162 and fishing townships. The former are characterised by a more stable population trend,
166 significantly fewer of the population in permanent employment furth of Park, and a smaller loss
167 migration. In the fishing townships, where growth and decline have been equally meteoric,
241 there is a larger proportion of persons in permanent employment furth of Park, and migration
228 losses have been greater. It is also significant that there is a smaller natural increase of
332 0.5 per cent in the agricultural townships. The only township which shows a natural decrease over this period is Calbost, one of the fishing townships.

SEAFORTHHEAD AND SHIELDERNISH

Rachel A. Hirst

131 Seaforthhead and Shieldernish are separated by 4,485 acres of rough grazing, the former lying on the northern shore of Loch Seaforth and the latter on the southern shore of Loch Erisort.

SEAFORTHHEAD

135 Seaforthhead, the most isolated of all the Park townships, consists of three crofts and a
361 gamekeeper's holding. The township boundary is situated between the 50 and 75 foot contours which at their furthest extent are only 150 yards from the shore. Immediately behind the road the land rises very steeply in rough uncultivable moorland covered with many boulders but generally below the road the land slopes gently at about 5-10 degrees, in places being
[241] completely flat. Here, however, the lazy-beds are very boggy and rushes have appeared in the ten years since cultivation ceased.

134 The soils are deep near the shore due to soil creep; higher up they are very thin and peat
137 accumulates to at least 3 feet both below and above the road. There is little cover; bracken is rare, but silverweed and heather, moorland sedges and grasses soon colonise disused lazy-beds.

241 Legally there are three crofts but only one is still cropped, the other two being used solely
[233] for grazing. There is, however, a gamekeeper's holding within the township boundary worked as a croft. The other two crofts are used as ancillary grazings to holdings in Airidhvruach and Balallan and have not been lived on for forty years and ten years respectively.

[244] The chief crops are oats and potatoes, though the gamekeeper had a patch of turnips and the other croft had grown them during the last few years until 'finger and toe' developed.
[407] Patches, about half an acre in extent, are drained with stone drains and ploughed by tractor, after which potatoes are grown to clean the soil, followed by oats for one year and then sown hay for three to four years. This is not strictly adhered to and several lazy-beds appeared to be
[314] in natural hay. There is no peat-cutting on the crofts as peat is secured just outside the township fence on the common pasture. Lambing has been poor for the past two years being
[231] only 50 per cent in 1958; the stock carried is twice the sheep soum. The cattle, Highland and Ayrshire or Shorthorn crosses, are below the soum, but previously nine cows and followers have been kept.

161 There has been a great decrease in population and cultivation since the resettlement in
162 1886. In Seaforthhead and Shieldernish as a whole, there were twelve crofters before the
241
178

[Habost]

134 Drift is found near the shore and laps round the three hills nearly up to the road, predominantly heavy clay with small boulders; this is replaced above the road by peaty loam on rock. At one time, bere was grown on the heavy drift. There is peat accumulation on the flat land near the road to a depth of about six feet and there are one or two peat banks.
137 Vegetation is poor; there is no bracken or cover and within the crofts, moorland grasses and sedges predominate on rough land, though there are many lazy-beds sown down to clover and cocks foot. On the hills heather predominates.

195 Habost is the oldest township in Park. In 1843 Maclennan came from Shieldernish and
692 took what are now Nos. 9, 10, 11, 12 and 13 and Ailean Tailear came from Taransay, Harris,
621 to No. 7. By 1886 there were thirteen crofts; in 1907 four cottars were recorded, three being there before 1886; in 1957, No. 11 which had been shared between two brothers since 1906, became legally 11A and 11B making fourteen crofts. There are also fourteen operative units although two are worked from Kershader, both as 'hay and grazing' units, and two are worked as one unit within the township, for there are three non-crofting units.

241 Only sixteen lazy-beds are dug by spade, the rest have been drained with stone drains and
409 ploughed by tractor owned by one crofter who loans it out to Habost and Kershader. There are three 'Croftmasters' (hand-tractors) in the township but these are only heavy enough for
293 bringing in peats, hay and similar light work. The progressive Habost community has fenced off part of the common grazing, to keep the weaned lambs off the croft from August till November and so save fodder for winter when the croft land is open to grazing.

[244] Oats and potatoes alternate in the rotation, with a little sown grass for hay, sown in enclosed
[246] parks of about one acre. The tendency now is to increase the number of parks, cut the hay in
[231] June and build up the lambs on the new grass. Shell-sand is used to fertilise the parks but
[324] elsewhere artificials, such as superphosphates, 'potato manure', potash, nitro-chalk and lime are used in addition to dung and, near the shore, seaweed. Most of the hay is taken from old lazy-beds.

231 The land is heavily overstocked: the soum is equivalent to 79 cow units, and actual stock is
233 144, whilst the figures for sheep are 191 and 618 respectively, including the sheep stocked in
[432] Park Deer Forest by seven of the Habost tenants. Sales of cattle are held at Garyvard in November
[221] and May and sheep and lambs are sold in Stornoway. Lambing was poor in 1958, 50-75 per cent being general, but many breeding ewes and other sheep have died.

241 The only cultivation on the common land belongs to the unofficial holdings. Behind Craigeal, however, there are some old lazy-beds, a well and ruins of a hut, which has not been used since before 1852. There used to be shielings on the far side of the common on Beinn Bhuidhe and
[311] below Loch na Ciste but these have not been used since 1888. Habost is one of the agricultural
[226] townships and fishing is only for domestic use; looms are to be found on only four crofts and
[282] trade is slack. One crofter has a lorry for contracting, carrying peats, fertilisers and stock
[493] to market and two have butcher's rounds in Lochs. There are two small stores.

361 Settlement is scattered, always on elevated ground, and in many cases the new house has
[312] been built in close proximity to the old house site. All have piped water either from the well or
[654] from a rain tank, drinking water being carried in the latter case. Grants from the Crofting Commission are enabling new building and improvements to be carried out.

[Habost] [Kershader]

464
161 Of the 53 residents, 19 are over 65 and only 5 under 15 years, leaving a working population
162 of 29: seven are in permanent employment elsewhere. The population has been steadily
166 declining since its peak of 121 in 1901.
167

Since 1946, the township has changed considerably. It has been completely fenced and the
178 method of cultivation has changed from spade and horse-plough to tractor and cultivators. A
241 further fence has been erected for a lamb park and much land has been re-seeded; an increasing
231 area has been put down to hay. It would seem that fattening of stock for market is intended, and
[407] better attention is being paid to stock. Yet the population is ageing and there are few young men
[162] to take the place of the older crofters; when working units become larger and stock decreases to a figure nearer the real carrying capacity of the grazing, the croft could become a profitable concern: at the moment, the croft is only maintained through grants and ancillary earnings. Should that happen, however, there must be more re-seeding and an increase of cultivation to provide winter fodder.

KERSHADER

Philip W. Wheeler, M. A.

131 Kershader is a township of forty-three permanent residents on thirteen crofts, which stretch
161 for a mile along the southern shore of Loch Erisort. The crofts extend up to one-third of a
162 mile from the coast with a two-and-a-half mile deep hinterland of common grazing. The extreme
133 elevation is 270 feet and the average from 125 feet to 175 feet, but the crofts, mostly arranged
361 in rectangular strips at right angles to the coast, are lower (maximum 125 feet) and include three main zones (Fig. 8):
241

134 (a) From the low cliffs of the shore to the road, approximately, a zone mainly below 50 feet,
361 dissected by four rejuvenated valleys. The soils of the greater part of this zone have a distinctive profile and tend to be moderately heavy, wet, and unsuited to fertilisation by seaware. The smaller hillocks in this zone have thinner soils of the same sort, but the main hill (crofts 10/11) is an extension of zone (c).

(b) A zone between 50 feet and 75 feet with hills rising to over 100 feet. The lower areas have varied soils, easily fertilised, and intermediate in type between those of (a) and (b), with peaty-loam characteristics, overlying aquiferous gravels. The higher areas have thinner soils of the same kind with poor grassy pasture; in places there are signs of former skinning.

(c) A zone of hollows with deep moss soils requiring intensive drainage and reacting well to heavy fertilisation with seaware and intervening heights covered with blanket bog, partly skinned, heather and grass. This zone passes into the common grazing.

Crofts 10, 11 and 12, irregular in disposition, have a steep coast line with gentler slopes over 50 feet; crofts 2 to 8, steep slopes in parts of zone (b), and crofts 1 and 9, again of irregular shape, are intermediate (Fig. 5).

241 In Kershader, there are thirteen legal crofts and twelve operative units. The crofts vary bet-
311 ween 4.4 and 18 acres, with a maximum of 3 acres reputed arable. In all, there are 23.45 acres reputed arable and 110.35 acres outrun. 24.5 acres are in fact under crop (oats 18.5, potatoes 6.0), and 9.5 acres under sown grass; and of the remaining 99.8 acres, mainly natural grass

[Kersh-der]

241 with heather and peat on the higher areas, hay is taken off 19.25 acres. Four acres, mainly for
311 potatoes, are worked by spade but most of the cultivation is by tractor hired from Balallan or,
407 in 1958, from Habost. Lazybeds are common and in some cases are carefully renewed, but
the present tendency, reaching its extreme in a field of about two acres on one croft, is towards
the formation of larger, ploughable fields for ease of tractor operation. Most cultivation is in
244 zones (a) and (b), with little development of (c) at present. The only crops are oats and potatoes,
246 with some garden plots of cabbages, turnips and carrots. The potato main crop is generally
Kerr's Pink (Golden Wonder on one croft), with a couple of rows of Skerry Blue or Edzell Blue
198 for earlies. There is no memory of Black Oats (Avena strigosa), and bere (Hordeum vulgare)
has certainly not been grown since 1930, and probably not since 1909. The oats are grown
256 exclusively for winter feed and are hand-threshed with stock and comb as the need arises; the
439 last water mill in the locality went out of use after 1914, the last handmill in 1916; no grain
has been sent to Stornoway since about 1930. Rotations are extremely irregular: some lazy-
beds are still cultivated with alternate crops of oats and potatoes and have heavy seaware and
manure fertilization, but most other arable areas have some sort of oats, potatoes, oats, sown
324 grass sequence. Fertilisers used are seaware and manure (ten crofts), manure (eleven crofts), shell
297 sand (one croft), lime (ten crofts) and artificials - 'Potato manure' and sulphate of ammonia -
241 on eight crofts. Artificial fertilisers and much of the seed are obtained through the Crofters'
Agency.

231 The only two horses ever owned by this township were kept on croft 11 from 1936 to 1953. The
407 plough was first introduced in 1936. When a tractor from Balallan became available for hiring
233 in 1953, the horses were disposed of. The present soums are by cow, young beast and sheep
per croft in proportion to rents and range from 3 cows, 3 young beasts, 69 sheep down to 1 cow,
1 young beast and 23 sheep. Eight crofts exceed their entitlement but no croft hasless than half the
souming and the deficiency is mainly in cattle, especially young beasts. On the other hand, no
operative unit is entirely without cattle as manure is extremely important. Cattle are kept for
234 domestic milk supply, and calves, having qualified for subsidy, are normally sold at 6 to 8 months.
432 10 acres of the common grazing were re-seeded in 1957 and the following rhythm for milk cows
221 is developing:-
231
233
311

(a) As soon as the weather allows in May, the cows are put out in the park for about three weeks.

(b) Next, about 6 weeks are spent on the common grazing between the ring fence and the new outer fence erected in 1957.

(c) Back to the re-seeded park for about five weeks.

(d) Return to the crofts for the winter, being let out either to the park or to the common grazings whenever the weather is suitable.

178 The young beasts spend much of their time on the outer common grazings. As most of the crofts,
beginning with one in 1938 and ending in sequence with 10, 11 and 12 probably in 1959, are fenced,
the old arrangements for township commoning from 15th October to 10th May are now obsolescent.
Another park was also fenced for general purposes and for weaning in 1957. Prices for calves
435 and cattle are very low and this discourages cattle breeding; on the other hand, lack of winter
keep enforces an occasional sale.

The rhythm of sheep husbandry is largely independent of that of cattle:-

(a) By 20th November all sheep, except possibly the lambs, are cleared from the crofts for the tupping of breeding ewes thereon till 31st December. Every crofter now keeps his own ram, exchanging it or buying another at least once in five years.

[Kersh-der]

233 (b) From New Year to mid-April most sheep are kept on the common grazing. Practices,
311 however, are irregular; some flocks are usually hand fed, others only rarely. In the for
221 case they heft near the upper limit of their home croft and remain fairly close at hand.
231 Most crofters hand-feed their lambs, probably housing them at night, allowing them hay
in the morning and turning them on to the common grazing in the evening. All this
naturally depends on weather conditions.

(c) From mid-April to May, lambing takes place on home parks.

Most crofters let their ewes-with-lamb out at one date.

(d) At the end of June, gimmers and wedders are clipped.

(e) In mid-July the ewes are clipped.

(f) The lambs are weaned in the first and second weeks of August.

(g) The dipping takes place in October and the rams are brought on the crofts.

432 There is no general sale time, sheep being sold or slaughtered at all seasons. There is no club
stock, but all but one of the Kershader crofters, along with crofters from neighbouring townships,
take full advantage of the arrangement, first established in 1941, to graze sheep at 2/- per sheep
and 1/- per lamb in Park Deer Forest. Hence irregularities of rhythm are introduced or
exaggerated.

231 Sheep are not particularly profitable: in general, wedder fleeces give 3½ to 4 lb, ewe fleeces
236 about 3 lb, and the wool is sold to the Stornoway mills and to the Wool Marketing Board. Average
435 sheep carcase weight is reckoned to be 41 lb. and the price rarely rises above £3 and almost
never above £4. Braxy and fluke are kept under by medicaments but remain potential dangers;
'Black leg' is still a serious problem. Many sheep are drowned in the bogs in Spring and late
snows (1955, 1958) are disastrous for lambing.

241 Under-employment is a serious problem in Kershader. There are nine males classified as
161 full-time crofters, but probably only four of these (two on one croft) are in fact in this category,
162 and of the total of thirty males with their homes in Kershader, only fifteen of the insurable
167 population are permanently resident. There are twenty-eight females with their homes in this
166 township, but on only six crofts do any of twenty permanently resident females help with croft
work. Local ancillary employment consists of weaving, fishing (for domestic consumption
464 only) and work on the roads. Boats, one with outboard motor, are owned by three crofts. The
463 only resident professional worker is a nurse. Ancillary employment must be, and is, sought
501 away from the township. As a result, of the 73 persons recorded as having migrated since 1939
or as being resident, periodically away and permanently away in 1958, 19 have left the area for
good, 4 are permanently away, 8 periodically away, and only 43 are resident. Only one person
entered the township since 1939. The age structure of the population, too, is far from the
optimum. The school in Kershader, which had 20 pupils in 1873, reached a peak of 110 in 1907
175 and declined to 28 pupils in 1953, now has but 17, although it serves Caversta, Garyvard,
178 Kershader and Habost. Maximum population was attained in 1881, but the total remained fairly
371 constant till 1911, after which decline was marked. Since 1950 this decline has markedly
increased.

182 It will thus be seen that the most serious problem facing Kershader is that of stabilizing the
241 population and giving it a stronger economic basis. Apart from the potential development of
tourism, fishing, weaving and other home industries, the only possible occupation is in
313 agriculture with perhaps a little forestry. Forestry, though important as shelter provision,
cannot be a practical proposition in large blocks or on a large scale, as it would dislocate the

161 Table XIX summarises the population structure and trends for the four districts. It is significant
162 that the two districts without service centres, which provide a range of ancillary employment, have
166 experienced more severe depopulation since 1939. This table also underlines the fact that earnings
167 from seasonal employment are insufficient: the incidence of permanent employment furth of the
434 districts is three times as great as the incidence of seasonal employment.

APPENDIX B

SHIELINGS - A NOTE

John E. Wearmouth with illustrations by Beth Blowers

195 From Figure 1, compiled from the First Edition six-inch map of the Ordnance Survey (1850
233 to 1852) and from personal observations, it is clear that the shieling system was at one time an overall feature of Park for the whole peninsula has traces of this transhumant economy.

361 The rudimentary structures, some of turf, others of stones and roofed with bracken or
342 heather thatch, are all sited on well drained sites, the majority on mounds. Almost all the sites are close to lochs or streams. The majority are in loose groups of from two to nine buildings, although there are some in isolation; no site has as many as twenty-six buildings as found at Airidh na Gaoithe in North Uist.

342 There appears to be two distinctive shapes of building - oval and rectangular (Fig.10). All shielings measured exhibited a remarkable similarity in dimensions, from 17½ by 9 feet to 13 by 12 feet. The oval structures are generally larger than the rectangular ones. Most of the shielings had two entrances, often, but not always, opposite each other.

195 The shieling system died out in Park about 1880 but the cattle continued to graze around the
233 shielings on the better grass, and the crofters had still to go out to milk the cattle at the shieling, although they no longer lived there. The sheep still use the mounds for shelter and grazing. These features of an obsolete economy are still easily recognisable from the luxuriant grass cover in a wilderness of peat bog and bare rock.

APPENDIX C

NORSE SETTLEMENTS NAMES IN NORTHERN PARK, LEWIS

Bridget M. Gordon, B.A., B.Litt.

103 See: Magne Oftedal, The Village Names of Lewis in the Outer Hebrides; in Norsk Tidskrift for
113 Sprogvidenskap, vol. XVII, 1954, (Oslo), pp. 363 ff.

103 Professor Oftedal points out the difficulties of these Norse-Gaelic settlement names: inaccurate spellings even in modern times, and lack of any useful evidence from older sources, make almost all the derivations a matter of conjecture. Sometimes two or more ON equivalents are possible (e.g. for Calbost), sometimes no satisfactory solution can be found (e.g. for Lemreway). Since Professor Oftedal frequently bases his explanation on pronunciations not recorded in written forms, his evidence is largely followed here.
SHIELDERNISH: the second element is N nes, 'headland'. Oftedal's explanation of the first as silda, genitive plural of N sild, 'herring', is satisfactory linguistically, but seems unlikely in meaning.

105 HABOST: 'high farmstead'. N. hár, 'high'. bost from N bólstaðr, 'farmstead', generally a farm of some local importance, but not the original settlement.

KERSHADER: 'shieling of the marsh or thicket'. - shader is N setr, 'shieling', a shed usually at some distance from the main farm and at the summer pastureland. ker- may represent either N kjarr, 'thicket, overgrown marsh'; or hjart, from hjortr, 'deer'. (Oftedal prefers the latter; both are found in other place-names, but hjart - is more common in the Hebrides).

GARYVARD: Oftedal interprets this as a Gaelic name containing a Norse loanword: he says the initial g is of a palatal quality, showing that it was formerly followed by a palatal vowel e, and derives gary - from gearraidh, a Gaelic loanword from N gerði, 'pasture denoting specifically "the grassy ground immediately surrounding a house or a shieling". He thinks the second element is Gaelic a'Bhàird, 'of the poet, or bard'. Hence, Garyvard means 'the poet's pasture'.

CAVERSTA: the second element is N staðir, 'farm', a plural form frequent in place-names, denoting a small farm. Oftedal hesitantly derives caver - from a N personal name Kofri, genitive Kofra. It may possibly be associated with N kofa, plural kofur, 'young puffin'.

TORASTA: the second element is N staðir, 'farm', as in Caversta. The first is almost certainly a personal name: Oftedal's note on the pronunciation of the middle syllable points to the name Torfi, genitive Torfa; possibly a name in pór-, e.g. pórðs-, 'belonging to pórðr'.

CROMORE: Oftedal explains this as a Gaelic name cró mór, 'big pen, fold'. kró or krá in N, however, means primarily 'corner, nook, inlet' and the two names Cromore and Crobeg are here applied to places on big and little inlets. The N kro took the meaning 'pen, fold' from Gaelic, but usually retains N inflections in the names of Lewis.

MARIVIG: -vig, more commonly -aig, is N vik, 'bay, inlet'. The first element may be either N marr, gen. pl. mara, 'horse'; or N marr, gen. sg. marar 'sea'. The latter seems more likely here.

CALBOST: - bost is N bólstaðr, 'farmstead' as in Habost. The first element could be either N kald- 'cold'; or N kálfr, gen. pl. kálfa, 'calf'.

GRAVIR: 'pits, graves'. N grafir, plural of grpf, 'pit, hole, grave.'

LEMREWAY, LIMERVAY: the second element is N vagr, 'bay, inlet'. Oftedal is baffled by the first: the pronunciation shows that, if it is a N word, the stem vowel was ei or œ (ø).

ORONSAY: originally the name of the island in the bay. -ay is N ey, 'island'; oros- from N árfiris, 'ebb-tide' (very frequent in names of islands isolated only at high tide).

STIEMERWAY: the second element is N vagr, 'bay', as in Limerway. Stiemer- is obscure; the narrowness of the stream at low-tide points to N stemma, 'to dam, block, obstruct (a river or stream)', but the development of the name is not clear.

SEAFORTH: 'inlet or fjord of the sea'; anglicised spelling of N sæ-fjorðr.

N = Norse
ǫ and ó may be represented by o
ð may be (inaccurately) represented by d,
þ may be (inaccurately) represented by th.

black leg--an enzootic, usually fatal toxemia of young cattle and less commonly sheep, goats, and swine; characterized by high fever, crackling discolored swellings under the skin; caused by toxins produced by an anaerobic soil bacterium, usually entering the tissues through minor wounds or abrasions.

braxy--a malignant edema of sheep that involves gastrointestinal invasion by a spore-forming bacterium; it produces an enterotoxemia characterized by staggering, convulsions, coma, and death. Common in Ireland, Scotland, and Norway.

fluke--a parasitic flatworm (digenetic trematode)

furth--away, abroad, beyond a certain boundary (Scottish variant of forth)

gimmer--(Scot) yearling, female sheep; a two tooth ewe

ouping ill--tick-borne virus disease of sheep and other domestic animals and rarely man that is related to or identical with Russian Spring-Summer encephalitis of man and occurs characteristically as meningoencephalitis accompanied by muscular tremors and spasms followed by varying degrees of paralysis

[Orinsay]

which rises steeply, exceeding 375 feet in the west and 150 feet to the north and east. From the north-west and north-east two glacially deepened valleys drain southwards, their lower ends being "drowned" by northward extensions of the loch.

Although peat covers most of the surface it is only in the hollows that it is significantly deep, for even on the gentler slopes the peat cover is frequently so thin as to expose a layer of morainic sub-soil containing many stones and boulders.

Two rowans and a dozen willows represent the only tree growth, but tree stumps frequently exposed in peat-cuttings suggest that woodland was formerly more evident. Whether this former woodland disappeared as a result of human action or of climatic change it is not possible to say, but it is certain that a century of overgrazing has not favoured natural regeneration. Moorland grasses, sedges and a little poor heather characterise much of the area, and reflect the poor grazing capacity of much of the moorland. Bracken has established itself in one limited area on a patch of neglected croft land.

Orinsay is unique in Park, for the present township is entirely a twentieth century development. In the early 19th century there was a settlement at the head of the loch, but in 1843 the residents were removed and the area enclosed and added to Crobeg sheep farm. In 1916, there was a proposal to establish fourteen crofts, but the applicants were requested to wait until after the war. At the end of the war the return of many young men with a desire to settle down led to serious overcrowding in Lemreway. Several of them 'raided' the Orinsay area. At first living in huts, they built their own houses, and in 1922 the Department of Agriculture intervened, recognising and fencing off fourteen legal crofts, and at the same time providing a good footpath. Seeing the success of their neighbours, four other Lemreway families, comprising 26 people, went to Stiemreway, about a mile to the west of Orinsay. Here, however, the Department of Agriculture did not intervene and with the community remaining isolated, most of the settlers returned to Lemreway within three years, although one family remained until 1939.

Six of the crofts have an area of less than ten acres, six have between ten and fifteen acres, while the remaining two occupy eighteen and twenty-five acres: the largest croft originally belonged to the shepherd on the sheep farm. Three of these crofts are not occupied, although worked by other crofters, with the result that eleven operative units share 161 acres.

Only a small part of the croft acreage is actually cultivable: even less is cultivated in practice. The broken and rocky terrain combined with the peaty soil allows nothing but the cultivation by spade of tiny lazy-beds. The total area now cultivated does not exceed 25 acres, although in the past it may have been nearer 40 acres.

Oats and potatoes are the staple crops, occupying 9 and 6½ acres respectively in 1958. Individual croft acreages of these crops vary in relation to the requirements for winter stock-feed, and in the case of potatoes, to domestic consumption. Nevertheless to produce even these meagre returns the soil requires careful preparation. A plentiful supply of seaweed is obtained from the shore and is the most frequently used fertilizer, while a little sulphate of ammonia is applied. Only two crofters use lime.

In the last two decades a marked reduction in the amount of oats grown has accompanied a decrease in the numbers of cattle and an increasing use of hay for fodder. Nevertheless only about 17½ acres of hay altogether are cut, and only five of the crofters sow any grass seed.

In August 1958, the township supported only 13 cows, 3 young beasts and 8 calves. Half of the crofters have a cow and a calf, but three have no cattle at all, and one even used condensed milk, a sad commentary on the state of crofting in Orinsay, but a phenomenon by no means uncommon in crofting areas.

231 [288] Recent trends also point to a decline in the numbers of sheep, although more are kept now than fifteen years ago. From 1942-51 the numbers were more than doubled (263-565). A great deal of this increase must have been a result of the ewe subsidy, but part at least may be connected with the war and post-war boom in Harris tweed. By 1955, when the subsidy was suspended, numbers had already begun to decline and have since fallen steadily. This year the township has only 374 breeding ewes while the rearing of only 236 lambs would suggest a further decrease in the future.

221 233 All the crofters keep some sheep although individual stocks vary from 15 to 150. For most of the year these sheep are grazed on the common pasture on the moor or on the eighteen acre island in the bay. In August, however, the lambs are gathered in for weaning and dipping; in November the gates are opened and all the sheep allowed to graze on the cleaner pasture within the croft boundaries. If necessary they are given fodder, but from the beginning of January they are encouraged to return to the moor, although the gates are not 'officially' closed until May.

311 233 The total area of the common pasture exceeds 1500 acres, but most of this consists of hummocky, waterlogged peat moorland supporting only poor quality coarse grasses and sedges. Over 700 sheep now graze this area and the apparently large common pasture is in reality drastically overstocked, a process which must inevitably harm the animals as well as the land.

231 235 [435] No pigs or horses are to be found in the township and each crofter keeps very few hens, normally just sufficient to provide eggs for home consumption. Any surplus eggs which do remain are sold to the Co-operative van, but prices are so low that the keeping of more than a dozen hens is far from profitable.

434 464 228 It can be appreciated that crofts of this size and quality can neither provide the crofter and his family with sufficient income, nor fully occupy the available labour force. As a result, people in the past have turned to the sea. Indeed the West Highland Survey describes Orinsay as "primarily a fishing township". Today the herring fishing has disappeared entirely and only one crofter still does a little lobster fishing, sending his catch direct to Billingsgate.

161 162 There are now 45 people resident in Orinsay but an examination of their ages reveals that less than half of them are between 15 and 64 years. Indeed there are only six resident males between these ages, and three of these spend at least part of their time working away from the township on the Eishken estate.

366 368 166 167 464 505 228 462 354 454 As there is neither a school, post office, shop nor garage in Orinsay, there is no available occupation in the 'service trades'. Therefore, over half of the males between the ages of 15 and 44 are permanently away in the Merchant Navy, returning home only for holidays, while another third are seasonally away with the whalers. Similarly almost half of the females of similar age work in domestic service in Glasgow. It must be realised that most of these people working away assist their families at home, and that a large part of the croft incomes are made up of money sent home, together with pensions and other allowances. Emigration from Orinsay to other areas has continued steadily, twenty people leaving the township since the war.

392 373 312 206 366 491 494 On the whole, housing conditions are good, due to relatively recent construction. There is only one traditional black-house, and even this house has electricity: only one house is without it. Water supply is not so certain as wells and springs are the only source. The township lacks a telephone and a shop, but is served by travelling vans. A good road, constructed within the last decade, connects Orinsay with Gravir; entering the township via the valley to the north-east, it serves directly all but three of the crofts. A bus leaves daily for Stornoway, about thirty miles distant.

161 162 Like so many other crofting townships Orinsay, above all else, gives an impression of congestion. The self-same hills that provide shelter also restrict cultivation. The crux of the situation is that land, extremely marginal in character, is being worked by too many tenants on holdings too small to be economic. With three residents to every two acres of cultivated land, Orinsay must be seen as an 'overspill' - an unfortunate result of the cottar problem in the 'twenties'.

/P. 35/

[Orinsay]

The future existence of the common pasture for grazing is being seriously endangered by verstocking. The souming is not enforced in Orinsay and the actual sheep stock exceeds the soum y 300 per cent. Peat-cutting is gradually destroying valuable grazing areas; in the last three ears there has even been some peat cutting on the better grazing on the island. The dangers both f overstocking and of indiscriminate peat cutting cannot be overstressed.

No evidence was seen of attempts to improve the quality of the common pasture. The establish-ent of shelter belts would provide not only shelter but a means of stopping the peat from 'slumping' own slopes if they were carefully sited. Much of the common pasture could be improved by a hill rainage scheme and by re-seeding, after sanding and liming, a project well within the capacity of e resident labour force.

Good crops on a few of the crofts suggest that the land is not inherently sterile, however, and would seem that if the holdings were reduced to a maximum of four, an economic existence might e feasible on these crofts. The stony nature of the soil limits the possibilities of tractor cultivation. t with an improvement in drainage, one might be used in the two valleys.

It is not so easy to be optimistic about the employment of surplus population resulting from uch an enlargement of holdings, although a revival in the fishing industry could absorb most of the men. A resent there are no looms in Orinsay and providing the Harris tweed industry can hold its own,there re possibilities in weaving. Seaweed is in plentiful supply, indeed Lemreway people also obtain upplies and should its quality prove adequate,the establishment of a processing plant would provide aluable employment.

Nevertheless it is becoming increasingly obvious that unless the holdings can be enlarged, whethe fficially or by sub-letting, and some further employment created, Orinsay is liable to stagnate, and epopulation to continue. The township which was developed to relieve congestion is now itself ongested.

SUMMARY AND CONCLUSIONS

The aim of the Glasgow University Department of Geography Crofting Survey is to record and nalyse material relevant to the crofting districts, and in so doing provide a clear and impartial tatement of the present situation. In inviting us to undertake a survey of Park, the Pairc Associa-on hoped that a body of fact would be assembled and conclusions drawn which would assist the ssociation in their admirable aims of advancing the well-being of the area. Their two Progress eports, of 1956 and 1957, indicate that they have already investigated many of the possibilities for evelopment. This summary refers to Park alone, and, it must be emphasised that until the survey f crofting is completed, no final assessment of the Crofting Area as a whole can be made.

The district of Park is one of the more isolated and difficult crofting environments. The ruggedn f the terrain, the high proportion of land of very low agricultural value and sheer isolation make the xistence of human communities precarious. In addition, many of the Park communities were first stablished as a result of population pressure in more favourable areas of Lewis, and the original mall settlements grew rapidly as a result of a change in land use which was a national trend - the onversion of poorer areas from subsistence farming to an extensive sheep-rearing economy. The mpact of this change came to Park in the form of the eviction of a large body of small farmers in avour of an extension of the grazing area. Thus the present conditions are a legacy of the relatively ecent past, and of legislation, particularly in the Crofters' Act of 1886, which accepted, and tacitly greed to the maintenance of a larger population than the land could reasonable carry. Two World Wars and fluctuating economic factors have had repercussions in Park and resulted in a change in conomic and social values, and depopulation has resulted: the 1951 population was 60 per cent of he 1911 total.

. The Commissioners proposed that only holdings rented at £6 and over should have security of tenure, with a view to discouraging the perpetuation of grossly uneconomic holdings; in the Act, all holdings were given security of tenure.

[Lemreway]

lgaris is dominant. Ling, which can tolerate considerable soil water, often occurs with Nardus, olinia, Scirpus caespitosus and Eriophorium. A few rowans, usually near the shore, and a few illows, usually within stone enclosures, are the only trees to be seen.

Of the thirty-three legal crofts in Lemreway, nine comprise less than five acres, while seventeen re between five and ten acres. Of the remainder, only two exceed fifteen acres and one of these is 0 acres. Six unoccupied crofts are worked by persons other than their tenants, so actually the 290 cres of croft land are shared by twenty-seven holdings. The seventeen-acre 'outend' was originally ivided between fifteen tenants but confused sub-letting has resulted in four separate holdings directly ccupying nine acres, and working another four acres. Thus the outend today must be regarded as e monopoly of four 'unofficial' holders.

Little more than a quarter of the croft land is cultivable and even less is actually cultivated oday: Figure 9 illustrates the crofting year. The broken terrain and the stony nature of the soil has ermitted the cultivation of tiny 'lazybeds' and the total cultivated area is now about 48 acres. Only e strips of land on the gentler slopes, where the soils are deeper, are now cultivated, but every roft shows signs of former, more extensive, lazybed cultivation, often covering at least two acres. or example, on the east side, natural hay is cut on the well-marked lazybeds at about 225 feet.

Oats and potatoes, 29.5 and 16 acres respectively,occupy almost all of the cultivated ground. ost crofts grow about half an acre of potatoes and one acre of oats; both acreages have declined, e former with a declining population and the latter with a reduction in the numbers of cattle; hay as increased in importance. No bere is now grown, though before 1900 it was preferred to oats. uins of the bere mill, which ceased to function at the beginning of the century, can still be seen. ifty-nine acres of natural grass are cut for hay but only four crofters had sown grass for hay in 958, about three acres in all. Few vegetables other than potatoes are grown though carrots are aid to grow well, and formerly turnips and cabbages were grown. The soil needs careful preparatio be productive and almost every crofter used some seaweed and at least twenty drew subsidies for l nd artificial fertilisers in 1958.

Stock totals have declined recently but the township has 36 cows and 22 calves. Only one croft without cattle and 22 of the 33 working units have a cow and a calf. The township has an Ayrshire ull on loan from the Department of Agriculture; one of the few remaining elements of the co-operati ownship system is that this animal is fed by the crofters, in rotation, during the winter.

All but two crofters keep sheep; stocks vary between ten and 120 per holding but the majority ave about 23 ewes with ten lambs. Although numbers have declined recently, the 3,025 acres of ery moderate common pasture support a flock of about 1,150 sheep, including about 650 breeding wes and about 300 lambs.

The souming is not enforced in Lemreway and it is remarkable that the total stock tallies almost xactly to the souming. An examination of the sheep soum reveals that the stock of 917 (excluding ambs) considerably exceeds the sheep soum of 626. It is interesting that it is nearly always the orking units of over 10 acres that are overstocked; of twelve such units, eight keep more sheep than hey are entitled to. Most of these crofts are grouped on the eastern side of the township where the rofts have a larger outrun.

Thus, while overgrazing is not so severe as in many townships, it represents a potential threat, articularly if the common pasture is not improved. However, in 1958 ten acres of the common asture have been enclosed and re-seeded. Six acres were sown with ordinary mixed grass seed, wo acres with pelletted seed and two acres with pelletted and inoculated seed. The eleven crofters aking part in the scheme put on 100 tons of sand to help drain and aerate the peaty soil, 2½ tons of round mineral phosphate and 2 tons of concentrated compound fertiliser, grades 1 and 2 - all of it y hand. The area was sown in May 1958: by the following August, there was a striking difference etween it and the untreated pasture. Next Spring, eleven cows will be grazed on this area. With the uccess of this scheme, it is hoped that more of the crofters will co-operate in re-seeding further reas.

[Lemreway]

The West Highland Survey Township Card[1] describes Lemreway as "predominantly a fishing
nship". The remains of an old curing station are visible today and until 1947 there were twelve
ats operating from Lemreway. A declining market, increasing cost of gear for obsolescent boats
the lack of a landing stage led to the decline of the industry in this township. Today there is
fishing boat which lands its catch in Stornoway working with modern equipment, drift and ring
s, it provides a regular income for a crew of six.

An examination of the population statistics proves interesting, especially when compared with
se for Orinsay. Lemreway's resident population of just over 70 males and 70 females is large
sidering that there are six unoccupied crofts. Eleven of the crofts have more than one house
the cottar population forms over a third of the total residents. More than two-thirds of this
sident population is in the two important age groups - between 15 and 64. With over forty
sident males in the working age group, Lemreway provides a striking contrast to other crofting
mships in Park.

Fourteen of these men are full-time croft workers, while nine others find work in ancillary
cupations such as weaving and fishing. A further eight supplement their croft work with regular
ployment - a postmaster and a postman, a bus driver, a lorry driver and several weavers. Just
r thirty people work away from the township permanently, fourteen in the Merchant Navy and
e girls in domestic service, while a further nine engage in seasonal work.

Emigration from the township has continued steadily with forty people leaving since 1939.
vertheless, Lemreway has a larger proportionate resident population than most townships.

Only four thatched houses are occupied and housing conditions generally are good. Every house
electricity, but, with four exceptions, water has to be carried from springs and wells. Most
the present houses were constructed in the 1930s and they are usually near to the road. Ruins
the old houses remain, some being used as byres, and these were built either along the shore or
the slope in the shelter of the hills, where the house was near the sheep, the peat and the springs.
day supplies of food, peat and even seaweed are brought by road.

Mention must be made of the possibilities of the tourist trade in Lemreway with its most
ractive situation and reasonable road connections. An approach has been made to the Scottish
uth Hostels Association and while hostellers could not greatly increase the income of the residents,
y would stimulate interest in the area. Accommodation for summer visitors, other than relatives
the crofters, is difficult to find but it seems that at least three houses could be used.

It is possible to be optimistic about the future of Lemreway, as at the moment considerable
erprise is being shown. A Ferguson tractor, bought this year by a man returning from whaling,
an example. It is to be hired out and could be put to good use in some parts, especially on the
end. The attempt to improve the common pasture and the new extensions to neatly painted houses
reflect a combined effort to improve conditions. The old economy of crofter-fisherman is
ng adapted to modern times and crofter-weaver, crofter-postman and crofter-bus driver are the
temporary employment combinations.

The pessimism and apathy noticed in many crofters is to be found in Lemreway but above this
the impression of enterprise. If Lemreway can continue to adapt itself to changing conditions,
hay be able to combat the 'drift to Glasgow' and continue as a successful community.

[Orinsay]

ORINSAY

Beth Blowers, Brenda Turner and John Wearmouth

Orinsay is a small crofting township clustered, in the form of a horseshoe, around the head of
heltered bay on the northern side of Loch Shell. Most of the houses are situated within fifty yards
he shore on a narrow strip of level land, while the crofts extend from the shore on to the moor

[1] The Directors of the Crofting Survey are grateful to Dr. F. Fraser Darling for granting access to the individual Township Cards, which are a storehouse of information. For detailed contents of the cards, see West Highland Survey p. 247.

ses of the present position.

GROUND PLANS OF SHIELINGS

An examination of the agricultural situation reveals that there are insufficient resources to make the present number of crofts viable. Overstocking in sheep, an attempt to increase cash income, has resulted in a high mortality rate, and consequent losses. The tenant of a small croft is faced with a classic dilemma. If he puts all his efforts into the working of the croft, the area of potential arable land is insufficient to maintain a large stock and even if the best rules of husbandry were operated, croft income alone would be insufficient to provide a reasonable living. The fishing industry, formerly the chief means of a livelihood rather than the croft itself, has virtually disappeared, and he is forced to find ancillary employment in an area where little exists and thus migration in search of employment is the only solution. The croft becomes a base for non-agricultural activity and a means of providing produce for home consumption rather than an effective agricultural unit. On the larger crofts, it is clearly possible to make a living if sufficient additional grazing in the non-crofting area is available - the agricultural townships, especially Seaforthhead, Shieldernish, Habost and Kershader, which comprise units sufficiently large and fertile, bear out this contention. Yet better husbandry is possible, and reclamation of the common grazings for improved stock rearing has started. The agricultural townships as a whole are better favoured by situation, soils and communications, and appear to possess a much greater degree of stability.

Since the decline of the fishing industry, the fishing townships have progressively declined. Income from weaving has replaced earnings from fishing as a means of combining croft work and ancillary employment to provide a living, but, as has been pointed out, the supply of weaving contracts is not regular and greatly depends on the state of the world market. The present centralisation of the Harris Tweed Industry in Stornoway is not favourable to the Park weavers: the suggestion by the Park Association[1] that a spinning mill be set up in Park would certainly help the local weavers.

If the present number of agricultural units and level of husbandry on them is to be maintained, ancillary employment on a large scale will continue to be necessary, and, as weaving and the service occupations alone certainly cannot provide it in sufficient quantity, temporary and regular employment furth of Park is bound to continue, and as this grades into permanent migration, the population must continue to decline and age. The capacity of the area for tourism is also limited. With the overheads which branches of parent lowland factories would have to face, the establishment of manufacturing or assembling employment is also unlikely.

A revival of the fishing industry holds out most hope but must take place before all the accrued skill has disappeared with the older generation of fishermen. The fishing grounds are within reach of the modern £20,000 boat: by co-operation between crews, fish could be taken to mainland markets such as Ullapool as indeed happens at present. Lobster fishing could be integrated with herring and white fishing. Such a combination of several types of fishing would ensure a more balanced economy and the Herring Subsidy would be a guaranteed element of income. It must be agreed that if mainland boats do come to the coast and sea lochs of Park, there seems little reason why local boats could not also be successful.

As far as the land is concerned, the survey leaves no doubt that improvements in husbandry and pastures are definitely possible. Yet, until viable agricultural units have been created, there is little incentive for large scale improvement in either sphere. It is an expert's opinion that no crofter working on a croft in Park which would bring in £300 a year would have time to engage in ancillary work and at the same time fully work his holding in accordance with the rules of good husbandry. If this opinion is accepted, and if it is also accepted that such crofts are desirable and the present successful crofts in the agricultural townships where there is a higher proportion of full-time crofters than elsewhere would bear this out, it follows that ancillary employment on such units would have to be ruled out.

Population in the West High-
The West Highland Survey
nd, 1951 (Edinburgh: Her

161 count, the number of people living in the Highlands has de-
162 clined 27.8 percent to 285,667, and those in the Western Highland, 40.7 percent to 119,071. Today the Highlanders represent only 5.6 percent, and the Westerners, only 2.3 percent of the population of Scotland.

Even though depopulation in the Western Highlands has gone at a faster rate than for the Highlands as a whole, it has not been typical of the entire subregion. William Hance, an economic geographer, has recently pointed out that "the assumption has too often been made that the Islands (the Outer Hebrides) have been depopulated at the same rate as the counties to which they belong and the Highlands as a whole."[2] He clearly demonstrates the contrasting increase of population in the Outer Isles, up to 1911, and the persistent decline elsewhere in the area. Again, within the last two decades, there has been an increase in population in the developing industrial area at the western extremity of the Great Glen, while depopulation has continued in all other parts of the subregion.

101 The Isle of Skye, the island with which I shall be con-
161 cerned in my dissertation, cannot be regarded as typical of
162 the Highlands or of the Western subregion. I rather regard it as standing in an intermediate position, geographically, demographically, and culturally. It rises from the Sea of the Hebrides between the Outer Isles to the west and the Mainland to the east. As we have just seen, depopulation is

[2] William A. Hance, The Outer Hebrides in Relation to Highland Depopulation (New York: By the author, 1949), p. 18.

101 more recent to the west, and in the industrial area of the
161 Great Glen the trend is reversing itself. To the north and
162 south depopulation has been more serious. To the east the general trend has been similar to that of Skye. We need not be troubled by statistics at this time, but for convenience
178 the population figures are given in Table 1. The Outer Hebrides have preserved more of the social aspect of the old culture than the Skye people while the Mainlander has felt the effects of the processes of acculturation with more obvious results than the people of Skye. In short, the Highlands are not a homogeneous region. They represent a great diversity of conditions.

101 My information on the contemporary culture of the Isle
115 of Skye was provided by the residents of three communities, the villagers of Portree and the crofters of Glendale and
101 Kilmuir. Portree is a small nucleated village with a popu-
621 lation of a thousand. It is important to the study because
368 in many ways it represents an alien way of life. Here are found the county and national government offices, staffed mainly by newcomers to Skye, which serve the whole island.
344 Here too, are the grocery, drug, clothing, and hardware stores which depend on the people of at least, northern Skye
344 for a large part of their trade. There are a number of craftsmen who are equally dependent on the rural population. For the most part, the members of both groups are newcomers
368 from the Lowlands or elsewhere in the Highlands. As the
365 terminus for the mail steamer which links Skye with the mainland and the hub of the daily bus service which connects the rural

hinterland with the outside world, Portree is a center for tourists during the summer. Due to the people's dependence on tourism and also the presence of newcomers, the villagers participate in a number of social activities which are not tolerated elsewhere on the island because of religious asceticism.

Glendale and Kilmuir are crofting communities, each with a population of about 300. All, except the ministers and school teachers, are dependent on the breeding of cattle and sheep and the growing of a limited amount of grain, potatoes and hay for all or a large part of their livelihood. All are bilingual, speaking Gaelic and English. Neither community has a village nucleus, but both have an economic focus. Glendale has a cooperative farm, and Kilmuir has a drained loch which has been divided among the small farmers. The significant differences between them are three. The Glendale people are land owners. In this respect they are rather unique in the Highlands. The Kilmuir residents, like most Highlanders, rent their crofts. The second difference is religious. Glendale is religiously homogeneous while Kilmuir includes church-goers of three Presbyterian sects. Finally, no formal social activities other than an annual meeting of the share-holders in the farm is allowed in Glendale, but Kilmuir has a club organization for the men who gather for lectures and discussions of economic problems.

The Continuity of Culture

Prerequisite to an understanding of the problem is a acceptance of a general characteristic of culture. All cu and every specific culture has behind it a connected, cohe developmental sequence. Any culture which has failed to maintain a genuine continuity has soon disintegrated and d appeared.[3] In order to preserve this necessary degree of continuity, this single tradition,[4] if you prefer, the cul must accept and value its past. At the same time, the cul is normally receptive to traits and trait patterns which h come into the culture from the outside world and can be in grated within the form of the culture. No culture, unless is decadent, is static.[5]

In these days when many individuals outside our disc pline and not a few within anthropology are haunted by the spectre of one world with a more or less uniform culture, is particularly important to ask how cultures and subcultu outside the main stream of Western Civilization avert the ultimate disasters of discontinuity and disintegration. Steward has provided one answer. He theorizes that "folk societies and folk cultures" are modified by way of readap

comparative description
made to reconstruct

121 the culture as it functioned in the days when the clan system
128 was an all-pervading influence in the lives of the people. This is intended to provide the necessary perspective for the ensuing processes of cultural change by revealing the essential features and the form, the distinctive pattern, of the culture. The stage set, four periods of social and cultural change, spanning over two centuries (1745 - 1953), are reviewed. The purpose is to analyze the extent of acculturation under the influence of the commercial and, later, industrial society of Great Britain. Throughout, emphasis is placed on population change and cultural continuity. Having established the main social and cultural trends, the economic, social, and religious aspects of the present day culture are examined in some detail for an understanding of its continued distinctiveness. The intention is to present not only the evidence for continuity, but also to point out the problems associated with the preservation of a cultural heritage no longer en rapport with the Western World.

121 The author's conclusions close the study. Despite chronic social instability, economic calamity, and striking changes in content, the culture has persisted and remained recognizable through the years. Although there have been periods of social disorganization and threatened cultural disintegration, irreparable disorganization has not been a characteristic of the culture. Obviously, the culture today is not identical with that of two hundred years ago, but the essential features which gave the culture its distinctiveness then do so today. Continuity has been preserved through a reintegration. In part, this

121 represents an incomplete adjustment to the more complex socio-cultural organization of Great Britain. The Skyemen have remained enisled geographically and culturally. As in other simple, isolated, kinship oriented societies, an adjustment has been made in the traditional culture. The most important factor in the preservation of continuity has been congregational religion. While Presbyterianism, with its stress on asceticism, has curtailed and modified many characteristics of the culture, it has provided a new focus to replace the clan. Furthermore, it has helped to preserve the essential features of the culture and maintain continuity by sanctioning the values important to the people. The culture is growing old with the people. The deviants, mainly the youth, who will not conform to the traditional values are being rejected. Social instability is a penalty for remaining peripheral to the Western World.

PREFACE

121 The problem which I have attempted to treat in this study concerns the question of the effect of population change, both increase and decrease, on an essentially peasant population living on the very fringe of Western Europe in one of the last remaining outposts of the Gael. My interest in this problem, stimulated to no small degree by Dr. Conrad M. Arensberg and my wife, stems from an old curiosity about the nature and function of the Highland clan system and the characteristics of a small, [101] dying remnant of a once widespread culture. My wife and I went to Scotland in June, 1953 to conduct field research on the Isle of Skye with the presupposition that the old culture had not withered and disappeared, even if it had been seriously modified by outside influences, especially those flowing in from the [101] wider society of Great Britain. We remained on the Island until March, 1954, when we turned our attention to library research and exiled Skyemen in Glasgow.

122 The research embodied in my dissertation was made possible by financial assistance from Columbia University, in the form of a William Bayard Cutting Traveling Fellowship; from the Social Science Research Council, in the form of a Research Training Fellowship; and from the United States Educational Commission in the United Kingdom, in the form of a Fulbright Scholarship. I

122 am indeed grateful for this aid and the encouragement which this support implicitly extended.

114 The field work was carried out under the supervision of Dr. Thomas T. Paterson, of the Department of Social and Economic Research of Glasgow University. Were it not for his sympathetic understanding of the problems of the novice field worker, I might never have concluded the research. He also read many sections of the dissertation and offered helpful criticisms and suggestions.

128 I would also like to acknowledge the advice and interest of Dr. A. K. Cairncross, Chairman of the Department, and that of Mr. Angus Matheson, of the Gaelic Department, who guided me through many of the difficulties of the Gaelic language and, as a native of the Isles, read much of my descriptive material on his kinsmen with a critical eye. At Edinburgh University I wish to thank Dr. Arthur Geddes, of the Department of Geography, and Dr. Kenneth Little, of the Department of Social Anthropology, for their guidance.

One debt of gratitude must be acknowledged only by implication, because those who helped me want it that way. Although they are unnamed, their hospitality and their contributions of both facts and insights are not forgotten. To the men and women on Skye, to the Skye exiles in the Lowlands, and to the government officials in Edinburgh and Portree I extend my sincere thanks.

The personal interest of Professor William A. Hance, of the Department of Economic Geography of the Columbia University School of Business, has been an invaluable support. Drawing on

128 his intimate knowledge of the Highlands, he offered many extremely helpful suggestions and insights. I must also thank my wife for her patience and understanding and for her many contributions to my field notes. She has been a constant participant in the writing of my dissertation.

Throughout the course of this study the faculty of the Department of Anthropology of Columbia University has been a continuing source of stimulation and encouragement. Professor Richard B. Woodbury made many helpful comments during the preparation of the manuscript. Professors A. L. Kroeber, now retired and Julian H. Steward, now at Illinois, provided much of the fund of knowledge which I have used, or abused, in the writing of my dissertation. Professor Charles Wagley, who originally aroused my interest in anthropology, was a patient critic and sympathetic advisor. Finally, I wish to acknowledge my special indebtedness to Professor Conrad M. Arensberg. His teaching, counselling, searching readings of the manuscript, and friendship are deeply appreciated.

CHAPTER I

INTRODUCTION

The Problem

121 The impingement of the social and economic forces of urban and industrial Western Civilization on folk and peasant societies has a familiar consequence, the inauguration of a population cycle. Frequently, these societies experience a rapid, accelerating increase in their size. If westernization is allowed to proceed, the burst of growth may continue, perhaps at a slower rate, over a prolonged period. In marginal areas, however, there are societies, and segments of larger societies, which are unable to make the required cultural adjustments. In these, entanglement with the Western World eventually leads to persistent depopulation. There can be no doubt that the swing of the population pendulum creates a host of problems. Among the doubtful questions there is one of particular anthropological significance: Is marked population change a sign of cultural discontinuity? This dissertation is dedicated to the purpose of answering this question. My thesis is that population change is not necessarily a criterion of cultural discontinuity. Although I shall examine only one case, future research along similar lines in other cultures may reveal

121 a wider applicability of my thesis. The evidence in support of
[101] my assertion was collected on the culture history of the Isle of Skye, a part of the area known as the Highlands and Islands of Scotland.

101 Since I shall frequently speak of the Highlands and Islands in the following pages, we should have a precise definition of the
[133] region (Figure 1). Geographically, the Highland boundary should be placed at the Great Highland Fault, a series of geological faults which extend across Scotland from the River Clyde to Stonehaven, south of Aberdeen. Politically and economically,
[231] however, this line has receded to the north and west. Since 1883 it has been common in Scotland to equate the Highlands and Islands with the "Seven Crofting Counties," those counties in which the
[241] predominate form of land use is the crofting system. Crofting may be defined as a system of hereditary tenure of a few acres of arable land combined with common tenure of hill grazings.
[234] These counties are: Argyll, Inverness, Ross and Cromarty,
[233] Caithness, Sutherland, Orkney, and Zetland. Out of the 163 parishes in these counties only 12 are considered non-crofting.[1]
[141] In addition to this shared socio-economic pattern, the seven counties have experienced common economic-geographical influences, a century of accelerating population growth, followed by a century of persistent depopulation.

---

[1] Adam Collier, The Crofting Problem: A Social and Economic Study (Cambridge: Cambridge University Press, 1953),
[114] p. 11n. A parish in Scotland is an ecclesiastical district which until 1929 was also a civil unit with self-government in such local affairs as education, relief for the poor and infirm, and health. If the British county is thought of as analogous to an American state, the parish can be thought of as a county, but one devoid of any function.

1. [Boundary of crofting counties-- Analyst]

101 The Highlands and Islands are often divided into a Western and an Eastern subregion. The Western Highlands include all of the Hebrides and, approximately, the western half of the counties of Sutherland, Ross and Cromarty, Inverness, and Argyll. This leaves the remainder of the seven crofting counties, including the islands of Orkney and Shetland, to the Eastern [632] Highlands. The seventy-two parishes of the Western Highlands have been isolated by physical barriers from communication with Great Britain. Here, too, differences of race, language, and culture have continued to distinguish the people from the other Scots. With this rudimentary delimitation of the areas in mind, let us briefly review their population cycles.

161 162 When Alexander Webster, then Moderator of the Church of Scotland, compiled his enumeration of the population of Scotland in 1755, the Highlands contained 257,183 people, and the Western Highlands had a population of 114,884. In terms of percentages, the total region, 47 percent of Scotland, had 20.3 percent of Scotland's population, and the subregion, 29 percent of Scotland, had 9.1 percent of the national population. By 1831, despite chronic emigration, the population of the Western Highlands rose to 200,955 (see table 1) but there had been a decline to 8.5 percent of the national total. In 1841 the total Highland population reached a peak of 396,045, but now only 15.1 percent of the Scots were Highlanders. By 1851 depopulation had begun. The Highlanders in the West had decreased in numbers to 190,728 and those in the whole area, to 395,540. From that day to this depopulation has been continuous. Although the 1951 census is still above Webster's

tial supersession of many formerly typical traits and
plexes, as the process of westernization proceeds, they
serve, at least, a recognizable residue of their identity.
ley and Harris have employed an analogous argument.[7] They
clude from an attempt to classify Latin American subcultures
t cultures of a tribal (a refined classification to replace
k) or peasant type change "in their cultural content and
their relative importance to the wider cultural scene,"
remain distinctive.[8] Now, it seems to me, most contact
uations have involved profound cultural and social dis-
bances. There is bound to be a loss of homogeneity. Insta-
ity, caused by too many changes coming one on top of the
er and by the activation of a population cycle, is all
inevitable. Under such conditions, if a culture is to
ntain continuity, it frequently has to readapt not only
the higher level of socio-cultural organization but also
the older way of life. I, therefore, suggest that when
isolated, relatively simple, kinship oriented culture
eriences a period of instability, discontinuity is avoided

were to accept a number of significant developments in material culture and religion, their tradition was preserved to be handed on to their living descendants. Not all cultures have succeeded in averting the ultimate disaster. When speaking of those of the Northwest Coast, for example, it is now customary to use the past tense. The cultures have lost their continuity and with it their identity.

Essentially, the first assumption to be kept in mind when reading this thesis is that a culture may be subjected to social upheavals, economic calamity, and remarkable changes in content and yet persist and remain recognizable through the years. A further exploration of the concepts of social and cultural integration and disintegration will facilitate our mutual comprehension of the problem.

Social and Cultural Integration

By implication, I have acknowledged the necessity of distinguishing between the concepts of "society" and "culture." Although anthropologists have not yet reached full agreement on this question, I believe the distinction to be important in a study of cultural continuity and population change if we wish to avoid ambiguity. In many ways, the dispute over what is social and what is cultural, as Kroeber has observed, stems from an embroilment with names rather than with principles.[11]

---

[11] A. L. Kroeber, "Concluding Review," An Appraisal of Anthropology Today, p. 365.

The difficulty is a lack of explicitness in using the terms in both anthropological and sociological literature.[12] They are frequently used interchangeably or are accepted as two ways of viewing the same thing.[13] From my point of view, which reflects the attitudes of many leading anthropologists, society and culture are logically separate though complementary concepts.[14]

Except on the infra-human biological level, there is no society without a culture. At the same time, man becomes a carrier of culture as a member of a society. Indeed, we abstract culture from the collective behavior of the members of the society.

There are no really significant differences of opinion concerning the nature of society and culture among those who distinguish between them.[15] A society is a group of people who have a sense of esprit de corps or belonging which results

from living together in an organized group and cooperating in accordance with well defined patterns of interpersonal interaction. Culture is generally accepted to mean the socially transmitted conventional attitudes, behavior patterns, and techniques which are distributed among the members of a society in accordance with their status positions and sub-group memberships.

If it is agreed that society and culture are separate though complementary and interrelated concepts, then, social and cultural integration do not necessarily have to go together. The culture may be integrated but incompatible with the capabilities of the members of the society, or the members of the society may not be enculturated. The social aspects under such conditions would appear to be disintegrated.[16] Kroeber has used France in the days of the Revolution as an example of a society which lacked solidarity but had an integrated culture, in pointing out how the two rather tend to go together.[17] The same argument is applicable to the problem of social and cultural stability. As Steward has pointed out, cultural stability cannot be measured by the criteria used in determining social stability.[18] The size of the group may increase or decrease without seriously disturbing the cultural patterns.

For further clarity, a pause to define my terms is in order. Except to Benedict, who emphasized the manner in which

by a network of relations.[22] The opposing condition is social disintegration. The group no longer has any common interests, and the society is fragmented. I shall use social instability to refer to the departure of people from the total group or any subgroup by either upward or outward mobility. Social disorganization is a disturbance of the interpersonal relationships which make for harmonious living together.[23] Most societies probably experience some degree of instability and disorganization at some time or another.[24] It is only when the latter condition is chronic that disintegration appears.

Of all the foregoing states of being, cultural disorganization has proved to be the most thorny problem. The same culture can be described as reorganized or disorganized by different investigators. Two studies of a single community amply demonstrate this fact. Redfield, in his first formulation of his concept of "folk culture," described the village of Tepoztlan in an organization - disorganization framework.[25] He was interested in the changes which urban influence brought about in the folk culture.[26] Tepoztlan, it might be added, was regarded as representing a medial cultural type between the

[22] Eggan, op. cit., p. 6; Gillan, op. cit., pp. 498-515.

[23] After writing the above, I discovered, at the suggestion of Charles Wagley, that my handling of the organization-disorganization continuum is somewhat similar to Merton's concept of dysfunction. See Robert Merton, Social Theory and Social Structure (Glencoe, Ill.; Free Press, 1949), especially Chap. 4.

[24] Franz Boas, "Methods of Research," in General Anthropology, ed. Franz Boas (New York: D. C. Heath and Co., 1938), p. 680.

[26] Ibid., p. 13.

primitive tribe and the modern city not unlike peasant communities in undeveloped areas of the world.[27] Almost twenty years after Redfield's study, Lewis returned to Tepoztlan to investigate recent modifications.[28] Changes there were, but Lewis also discovered factual discrepancies and found himself differing with Redfield in the interpretation of the evidence. The result was a re-study of the village which advanced the conclusion that there was no reason to speak of disorganization. The changes rather involved a new kind of organization.[29]

It would appear, then, that if the anthropologist is concerned only with changes seen from the perspective of a supposed pre-contact situation, he may decide, as Redfield did once again in Yucatan,[30] there has been disorganization. Lewis is not the only one who has questioned the validity of this approach. Gross has found severe limitations in Redfield's concepts of organization and disorganization because they force the analysis into an organization-disorganization framework and neglect the possibility of the existence of different levels of organization in cultures.[31] Steward, who has, perhaps, been the most explicit exponent of levels of sociocultural organization, prefers to take the larger cultural framework of which the disorganized culture becomes a part as his point

f departure.[32] He used this methodology in Puerto Rico and
onclude that the culture exhibits a readaptation to the higher
rganizational level and a reintegration into the national
ulture.[33] The individual carriers of the culture assume
pecialized roles in a more complex, heterogeneous system.
o all intents and purposes we are dealing with a problem
imilar to that of simple cultural change. Change must be
easured against stability, and stability can only be under-
tood when change is gauged against cultural conservatism.[34]
n either type of study the conclusions reached will depend
o no small degree on the stress of the investigator.

Shortly before World War II, an attempt was made by a
roup of anthropologists and rural sociologists to analyze
ultural integration and disintegration. The result was the
ural Life Studies. The six studies had for their objective
he investigation of factors which facilitate or impede
hange, contribute to adjustments or maladjustments, and make
or social stability and instability in the individual and
ural community.[35] Instead of making studies of culture the

/1/ field workers studied social groups which manifested extreme social stability and instability.[36] Their criteria were economic self sufficiency, associational groupings, influences from the national culture, and population movements. Two of the reports are particularly pertinent to my thesis, the Old Order Amish, in Pennsylvania,[37] and the town of Landaff, New Hampshire.[38]

The Old Order Amish were the only people in the series who were bound to each other by a cultural tradition. They were considered to represent extreme cultural integration which was ascribed to their common background, language, vocation, and religion; to their strong kinship ties; and to their devotion to the Old Order, epitomized by their religion, which rejected the modern world. Steward regards them as an example of cultural stability and social instability.[39] Over the years the deviants have been rejected as a means of reinforcing cultural conservatism. As we shall see, this cultural defense has been in operation on Skye. Furthermore, the Old Order Amish and the Skye inhabitants have been able to maintain not only cultural integration, but also social integration, by casting off the nonconformists. The deviants would not only change the culture, but they

/2/ also would disturb the relationships which make for group harmony.

Landaff is a community which made an early agricultural adaptation to the local resources. There was a relatively permanent settlement, adequate social institutions, and local self-sufficiency. Population pressure disturbed the former adjustment. The community is now said to be an example of cultural disintegration and social instability which is evidenced by a high rate of emigration, especially of the youth, persistent economic limitations, the decline in the importance of the school, church, and Grange as supporting community associations, and the gradual decline in opportunities to express self-reliance and self-determination within the community. Unlike the Amish or the people of Skye, the Landaff residents had no traditional ties and, hence, few fixed controls. The social group held only as long as the interests of each individual were compatible with those of his neighbors, and local opportunities existed to fulfill his ambitions. Were it not for old loyalties to the community and farming as a way of life, there might be complete social disintegration. At the same time, those who have left, often to be replaced by new ethnic elements, have carried the basic cultural values associated with strong individualism with them. In contrast to the Amish community and Skye, Landaff is characterized not only by social instability but also by social disorganization and, at least, partial social disintegration. This brings us to the last concept which I shall discuss, Durkheim's concept

/1/ of anomie.

According to Durkheim, a disorganized society has the following characteristics: a deterioration of the traditional habits of interpersonal interaction with members of the group, a low degree of social contact among the group members, and a loss of social control.[40] In a word, there is normlessness. As a result, the individual finds himself caught between conflicting ideals and values. The question is, how much of this is cultural? There appears to be two alternatives. On the one hand the individuals in the society may have an integrated culture, but they may not be enculturated or their refusal to follow the patterns of the culture may render the norms and sanctions impotent. On the other hand, the culture may have disintegrated because of a disruptive transition. In either case there would be anomie. This concept, by the way, must be considered relative and applicable only to situations in which the disorganizing forces threaten to overwhelm those favoring integration.[41] Durkheim's theory of anomie has been used in several recent analyses of groups which have experienced social instability and the impingement of economic forces from the outside in common with the Isle of Skye. Homans employed the concept to analyze the social "disintegration" (disorganization) of a small New Hampshire hill farming town.[42] Loomis and Beegle have used it as a means of explaining the growth

[40] Emile Durkheim, Le Suicide (new ed.; Paris: F. Alcan, 1930), pp. 272-282.

[41] Cf. Merton, op. cit., especially Chap. 4.

[42] George C. Homans, The Human Group (New York: Harcourt, Brace and Co., 1950), pp. 336-367.

/2/ and spread of fundamentalist religion, which they regard as a counteragent for social disorganization.[43] I, too, shall make use of this theory to show that there has been threatened social disintegration on Skye and a reintegration despite continued instability. The individuals who remain and those who return in later years, as many do, are fully enculturated. Further, if my supposition regarding the relation of cultural disintegration and anomie is correct, the existing social integration on the island is an additional support for my argument that population change is not a criterion of cultural discontinuity.

To summarize, the points I wish to emphasize concerning social and cultural integration or the lack of it are six. Society and culture are separate though complementary concepts. A society is an organized, cooperating group of people; the way of life they follow is their culture. Social and cultural integration tend to go together, but they are independent variables and must be judged by different criteria. Cultural disorganization is a much debated condition. Using the concept of sociocultural levels, the importance of disorganization shrinks in favor of reorganization and readaptation. Finally, the concept of anomie, normlessness, can be used to determine whether or not there is threatened social disintegration, and it may provide supporting evidence for cultural continuity.

[43] Charles P. Loomis and J. Allan Beegle, Rural Social Systems (New York: Prentice-Hall, 1950), pp. 401-407.

Wider Applications

The decline of rural population is not peculiar to the Highlands of Scotland. There are areas of southeastern Scotland, including some long celebrated for cattle and grain, which have lost nearly as many people as the crofting counties. Berwickshire, for example, is one of the richest farming districts in Great Britain. The population trend, however, has been much the same as that of the Highlands.[44] In 1801 there were 30,206 in the county. After a peak in 1861, there was steady decline until now there are only 24,770, a decline of 32.3 percent. The loss of rural population is a well known phenomenon beyond Scotland's borders. It has been a persistent problem in Ireland and Wales for more than a century. Indeed, it has been a familiar phenomenon in Western Europe since the days of the Industrial Revolution. The only notable exception appears to be Italy; her rural population has increased 40 percent in the last four decades. The same tendency for decrease is found in the United States in such different areas as the Appalachians, the midwest, and, as has been observed, New England.

Population decrease has also been the fate of many primitive peoples. The Island of Yap, for example, has lost a remarkable proportion of its former population in contrast

[44] Census of Scotland: Berwickshire, 1951.

with many of its neighboring Caroline Islands.[45] A similar tendency has been reported for the Aleutians.[46] On the other hand, there are the Pueblo,[47] who have recently begun to increase, and the Navaho,[48] who have grown in numbers at a rate no less striking than the decline of innumerable tribes in the non-Andean areas of South America.[49]

Although the fate of any one community in contemporary United States may be insignificant to the social scientist who is interested in culture change, social instability among folk and peasant peoples is a factor which should not be overlooked. I am certain that it is not a criterion of cultural discontinuity, unless the tribal or peasant group suffers complete obliteration. I am equally sure that it is commonly symptomatic of cultures which have been unable to make a complete adjustment to the new and higher sociocultural organization reaching down to them. Some tribes, it is true, have succeeded in making a pretense at adjustment. Noted for

Steward (Bureau of American Ethnology, Bulletin 143; Washington, D.C.: U.S. Government Printing Office, 1949) Vol. V, pp. 655-663; and A. L. Kroeber, Cultural and Natural Areas of Native North America, ("University of California Publications in American Archaeology and Ethnology," Vol. 38; Berkeley: University of California Press, 1939), pp. 131-181.

preserving a good deal of their complex culture, the Pueblo and, in particular, the Navaho have increased in numbers. The isolation of an inhospitable environment will not fully explain their conservatism without instability. One after another, even more isolated Aleutian villages have disappeared. Those which have experienced social instability and disintegration have paid the penalty for preserving too much of their traditional culture. In Aleutian villages where the traditional culture has been largely replaced by western ways social disintegration is, at present, unknown.[50] Depopulated Yap is, perhaps, the most familiar case of persistent refusal to adjust to the impinging Western World.[51] All over Europe there are peasant peoples who are facing an identical situation. Techniques for complete adjustment to their larger sociocultural groups are unavailable. Still tied to the land and their old ways instead of to 1955, they are slowly dwindling in numbers. In all of these cases of social instability the culture is growing old with the people. The deviants, the individuals who will not conform to the traditional behavior patterns and norms, leave, and they are mainly the youth. Whether or not there is always a change in the focus of the culture such as occurred on Skye I am not able to say, but, doubtlessly, there are always changes in content as a part of the process of reintegration. Nevertheless, the form, the

[51] Keesing, loc. cit.; see also J. C. Furnas, The Anatomy of Paradise (New York: William Sloan Associates, 1946), p. 302.

basic distinctive pattern, of the culture is preserved and continuity is maintained.

The Organization of the Thesis

My approach to the problem of cultural continuity despite marked population change is oriented toward the culture history of the Isle of Skye. To this end, in the next chapter (Chapter II) I shall describe the environmental limitations of the island and, briefly, present a comparative analysis of the economics, settlement pattern, social organization, and religion of Skye. This is intended to acquaint the reader with the local culture and provide a perspective for the following chapters. In Chapter III I shall be concerned with the culture as it was before the commercial and developing industrial society of Great Britain became a significant acculturating influence, that is, before 1745. Chapter IV is devoted to a review of four periods of social and cultural change following the introduction of the tenets of commercialism. Throughout the chapter emphasis is placed upon cultural continuity despite population increase and then decrease. The continuity will be shown to have been preserved over two hundred years, even though there were two periods of threatened cultural disintegration, chronic social instability, and several periods of social disorganization. Having established the main social and cultural trends, the contemporary culture is examined for an understanding of its continued distinctiveness. In Chapter V, the contemporary economic

tterns are described. The main points considered are the stem of land use, the income of the small farmer, agri-ltural production, the seasonal round, and the division of bor. Chapter VI presents the social organization as it today, with particular emphasis on status and role. The tterns of interaction within the nuclear and extended milies and among neighbors and friends are described in rms of these concepts. Religion is analyzed in Chapter VII discover the function of religion in ordering social re-tionships and the importance of religion in preserving ltural continuity. In the final chapter the evidence for ltural continuity through periods of population growth and cline is summarized, and the conclusions which this evidenc rmits are presented.

487 population as it is one of accessibility. It is, for exampl
131 only 165 miles from Glasgow to Mallaig, but the trip takes s
133 hours because of the constant succession of curves and the s
of severe gradients over which the railroad runs.

The General Appearance of Skye

131 Skye has an irregular shape. Large peninsulas extend
133 into the Minch on the northwest and into the Sea of the Hebr
on the southwest. Promontories, divided by sea lochs, reach
to the west and east. Numerous small lochs and several larg
sheltered bays contribute to the greatly indented coastline.
[10] While philologists may doubt the derivation of the Gaelic na
for the Island, Eilean Sgiathanach, from the Gaelic sgiath
(a wing), "the winged isle" aptly describes Skye.

133 From the mainland, the Island appears to be dominated
the jagged silhouette of the Cuillin Hills. Rising in fifte
angular peaks, these mountains are the first indication that
surface of Skye is as irregular as its shape. The character
typological features of the Island are the result of volcanic
action in the Tertiary period of the Cenozoic and subsequent
erosion, particularly during the Pleistocene when glacial ice
flows gouged and scoured the landscape.[1] Geologically Skye
consists of an extensive basalt plateau; two intrusive masses
one of gabbro and the other of granite; and a complex of olde
differentiated strata and outcroppings which include Juriassi
and Cambrian limestone, Torridonian sandstone, and Archaean g

132 136 planting birch, hazel, oak, juniper, larch, spruce, and short
240 pine. These are the usual trees found on the plantations.
Typically, the Sgiathanach prefers an unobstructed view to trees. He may tolerate a mountain ash or elder near his house, but he has little desire to be surrounded by woods.

The Climate of Skye

132 Lying in the temperate marine climatic zone and influenced by the Gulf Stream, Skye is noted for its mild winters and cool summers. The annual mean temperature range is between 14 and 16 degrees. Temperatures above 70°F. and below 40°F. are exceptional. Although frosts may be expected from October into May, severe frosts are uncommon. In recent years there have been two, one in 1954 and one in 1947. The climate is not, however, to be considered moderate. The spring is not appreciably warmer than the winter. With a maximum noon temperature of 68°F. for August of 1953 (Struan), it is hard to believe that summer exists as a season.
311 Economically, these climatic features mean that the planting and growing season is late and pasture growth is slow.

The outstanding characteristic of the climate is the amount of rain. Rainfall varies from considerable to excessive, depending on the locality and the year. The rainbearing winds blow in from the south and southwest. Thus, in the lee of the Cuillins, Red Hills and the ridge of Trotternish, the annual rainfall approaches 80 inches. The driest area of Skye, northwestern Trotternish, has an average annual rainfall of

132 80 inches. The rest of the Island normally receives about 60 inches a year. The yearly variation is usually only 10 percent on either side of average; rarely is it as much as 20 percent. In northwestern Trotternish, for example, for the period 1944-1947 the annual rainfall was 51.04, 60.80, and 46.72 inches, respectively.

The important factor is the detrimentally high effectiveness of the rain. Falling as a slow drizzle, the rate of evaporation is extremely low, because of the mildness of the climate and the prevailing cloudiness. Furthermore, the rain has an unfavorable distribution. A well-distributed rainfall would mean that the spring growing season was moist enough to promote growth and the autumn harvest season was dry enough to facilitate ripening and work in the fields. On Skye the wettest months are September
132 through January. The driest are March, April and May. The
241 difficulties of securing the harvest are aggravated by the constancy of the rain. The harvest season of 1953 was marred by
132 59 consecutive days of rain. One man who was acquainted with the experience of the American troops in the Aleutians, an equally wet archipelago, during the Second World War at length asked if the Americans had taken over Skye. Actually, the pattern has been characteristic over the years. Even for the driest part of Skye in one of the driest years, 1947, the plague of incessant rain was marked. Of the 46.72 inches, 19.3 fell in September, October, and November.

The Island, then, is humid and cloudy. Hours of sunlight are few, only around 25 percent of possible. In spring and

132 summer, despite the long duration of daylight, the average daily hours of sunshine are six. In winter, the daily hours of sunshine are reduced to less than one. In 1953, an average year in respect to sunlight, the total hours of sun were 1142. Over
132 200 hours were recorded in June but less than 20 in December. It
103 may be that the philologists are right in insisting that Eilean Sgiathanach is derived from the Norse ski (cloud). Certainly the poetic name for Skye, Eilean a Cheo, the Isle of Mist, is in keeping with the atmosphere.

The prevailing rain and cloudiness are serious handicaps to agriculture, but they are not the only inhibitive forces. The wind is another very important factor. Gales are common. They restrict the number and variety of crops which can be grown, hinder tree growth, and often make the use of the sea impossible.

The System of Land Use

311 The Sgiathanach, the Skyeman, is a small farmer who combines pastoralism with a limited amount of agriculture. In view of the severe environmental limitations on crop production and the markedly disproportionate ratio of arable land to natural grass land, this ecological adaptation of the culture
172 is by no means surprising. Nor is the fact that this adap-
311 tation has persisted since the first known appearance of man a startling revelation. This was four thousand years ago when the culture history of Skye began with the advent of the
311 Neolithic. This persistence is simply an expression of the

311 well recognized relation of culture and environment.[9]

The economic foundation for the present day culture is
241 311 commonly referred to as "the crofting system," a system of
233 417 hereditary tenure of individually held small patches of cultivated land combined with communal use of grazing land. On his small plot, typically under five and seldom over ten acres, the crofter grows a little oats and hay for his stock, a few potatoes for his family and dairy cattle, and, in some cases,
171 a few garden vegetables. Anyone who is acquainted with the Irish small farmer will recognize the underlying similarity of the two systems.[10] The communal element in the crofting system on Skye, however, is a distinguishing feature. In addition to his croft, the individual has a common, concurrent right to a share in an extensive area of grazing land. Here he keeps a couple of cows and a score or two of sheep. After the harvest, the stock are frequently brought down from the hill and allowed to indiscriminately graze the arable land of the crofters who share the communal lands. Thus, the efficient economic unit is not the croft, the few acres of arable land, but rather a "township," a collection of crofts and the common grazing lands. The system differs from the runrig system which prevailed two centuries ago only by the holding of permanent, compact blocks rather than dispersed and shifting strips of arable land. It is a unique survival in Europe.

[9]See, for example, Kroeber, Cultural and Natural Areas of Native North America, p. 6.

[10]Cf. Conrad M. Arensberg and Solon T. Kimball, Family and Community in Ireland (Cambridge: Harvard University Press, 1940), pp. 5-7, 31-33.

573 The labor in this pastoral-agricultural economy is
241 provided by the crofter's family, periodically aided by some
231 for all of the families who share in the common grazing.[11] Under
178 the direction of the father, the mother and children care for the crops and cattle. Heavy work, such as ploughing, reaping, and feeding the cattle in the winter, is left to the men. The women milk the cattle, help at the harvest by raking and stacking, and care for the garden. Although men never do any work in the house, in the absence of a son the wives and daughters are expected to fill in the gaps in man's work in addition to
476 running the household. Inter-family cooperation centers on
231 the handling of the sheep. Frequently, the families who share the common own the sheep collectively, as a "club stock," and share in the expenses and profits as well as the labor.
463 The only basic pattern in the division of labor is that women never shear, and it is their responsibility to feed the group.

Formerly, the annual economic cycle was adjusted to the
231 demands of crop cultivation and cattle breeding. Within the
231 last hundred years, however, sheep have assumed commercial
178 importance and now determine the seasonal tempo of labor. The old year ends and the new begins with the bringing in of the rams from the hill. In March the sheep are dipped and then the
240 preparations are made for the lambing season, in April. From spring until autumn there is a rapid succession of duties: ploughing, planting, peat cutting, dipping and shearing the sheep, stock sales, harvesting, and similar tasks. After the

[11]Cf. Ibid., pp. 63-64, 70-74.

111 rams are put out in November, the pace becomes slower, the
231 main job being the feeding of cattle.
434 The economy is neither a subsistence nor a self-sufficient economy for the majority. All but a few large crofters have to supplement their income from the croft with some form of outside employment or independent source of income, for ex-
417 ample, contributions from a child or a pension. For many the
361 croft is no more than a home. For an aged person, it provides a means of living cheaply. The rent, which is fixed by law,
417 is only nominal, and the taxes are negligible. There is more to
571 crofting than simple economic considerations. Indeed, if it
361 were only a matter of economy, the system would have been abandoned long ago. It is a way of life in which the individual
559 finds meaningful patterns of interaction and an ascribed status compatible with his aspirations. The land is more than a potential source of income. It is the ancestral home. The tie to the land is an expression of the sentimental bond of kinship.[12] Many, perhaps the majority, have spent a good part of their lives in other parts of the world working for a wage and looking forward to the day they might return to the Misty Isle. Although only the Glendale crofters are land owners, the law has given the tenants complete security of tenure and the right to bequeath the croft to a member of their family. Thus, they can return to their township and find solidarity.

[12]Cf. Ibid., pp. 64, 81.

Non-crofting Economic Activity

464 Employment opportunities on the island are limited. The only industries are a small malt distillery, which employs thirty men, a small wool textile mill where about 15 men and 15 women find work, and a few gravel and sand pits. There is a promise of greater employment opportunities in the extraction and processing of diatomite and in forestry. A few men are fishermen. The majority of men who work for a wage are seasonally employed in service operations, especially county road workers, bus and truck drivers, and general laborers. A number seasonally migrate to the mainland during the winter or go to sea. Women find employment in hotels during the summer or local shops. There are no active household industries. Many young women spend the summer on the mainland in domestic service. In several areas the crofters are dependent on the tourist trade for almost all of their income. The summer tourist trade is one of the most important sources of revenue for the island.

The Settlement Pattern

361 The settlement pattern on Skye, like the system of land use, is an ecological adaptation of the culture to the environment which has been stabilized in its essential details since the Neolithic. The areas of permanent settlement have always been limited to the coastal fringe and a few internal glens, regions with the best agricultural conditions, and to elevations under 400 feet. Further, man has tended to concentrate on the

364 basalt plateau where the light and potentially rich soil and the relatively luxuriant pasture land are valuable assets. The remainder of the island has been generally avoided, except for a few isolated areas of mixed beaches, moraine, and similar 364 deposits of local importance. The contrasting population 162 densities in modern times support my assertion. With an overall density for the Island of thirteen per square mile, northern Skye has a density of nineteen per square mile in contrast to six per square mile in southern Skye. This three to one ratio has persisted for at least two centuries.

361 Until the nineteenth century all the inhabitants of Skye lived in isolated hamlet-like clusters. The majority continue to dwell in dispersed crofting communities. Indeed, the dominant characteristic of the settlement pattern is, with a single exception, the lack of nucleated villages. Skye is not unique in this respect. The Irish and the Welsh have never made the village a part of their cultural heritage.[13] The pattern I am about to describe will, no doubt, be unfamiliar to many who are only acquainted with rural communities of the Western Hemisphere. The units of settlement on Skye are on a very diminutive scale compared to those to which we are accustomed.

361 As we have seen, the efficient socio-economic unit is the 621 township, the collection of individual crofts and the communal grazing lands. Skye contains 182 townships. All of them are found in an inhabited area of roughly thirty square miles.

[13] Conrad M. Arensberg, The Irish Countryman (New York: Peter Smith, 1950), pp. 146-155; and Alwyn Rees, Life in a Welsh Countryside (Cardiff: University of Wales Press, 1950), pp. 128-129.

Township size is variable. There is a complete range from 361 one township with a single inhabited croft and a population of 621 three, an old man and his two sons, to one with fifty crofts, 162 held by thirty-two families, and a population of almost eighty. Most townships contain between six and twenty crofts.

The crofts are set out in long, parallel strips, typically, at right angles to the coast, or, if the township is in a glen, across the glen. In the older townships, the houses tend to be built at one end of the strip on the least productive land. The byre, if there is one, stands at the rear or either side of the house. Exposure or road access have not always been determining factors. Most frequently, it would seem, alignment along a road is present only because the county government has built a road into the township. Only in the more modern townships, those planned or re-organized within the last fifty years, have the crofters tended to build near the road. Several of the townships lack any apparent orientation. The houses are scattered up and down the lower slopes of the hills which rise above the cultivated land.

Wherever the configuration of the land and the environmental factors of soil and rainfall permit large settlements, there is a grouping of townships into the pattern of the British open country neighborhood or the French line village.[14] Scattered among the crofts, without any nucleus of community 364 buildings, there are, usually, a school, one or two churches, 368

[14] For an analysis of rural settlement patterns, see Loomis and Beegle, op. cit., pp. 229-231, 234-237.

361 one or more country stores, a few workshops, and a post office. 621 Kilmuir will serve as an example of these larger settlements. 364 368

Along the shore of Loch Snizort, on the peninsula of 361 Trotternish, there is a broad, fertile plain. Including old 621 Loch Chaluim Chille, there are approximately ten square miles 311 of good land. Although the soil is not cultivated as intensively as in the days when Kilmuir was "the granary of Skye," this is regarded as the best agricultural region on the island. 162 In all there are 122 crofts, held by 105 crofters, in 9 townships. There are also two small farms. The population is slightly over 300.

361 The crofters' cottages are loosely strung around the 621 old loch and across the plain in an irregular "Y" shaped pattern (Figure 3). Basically the pattern resembles the French line village, but there are several features reminiscent of the British open country neighborhood. Most of 311 621 497 the cottages, it would seem, were originally built on the landward fringe of the plain and along the shore of a small bay, known as Camus Mor, without any regard for road access. 278 In recent years, increasing dependence on motor transport has led to demands for roads. Now almost all the crofters, except those in Bornesketaig, have a paved road running by their door. About a third of the houses are on the county road which encircles the peninsula and links Kilmuir with the outside world via Portree.

621 In the center of Kilmuir, in the township of Balgown, 368 and two spireless churches, a church hall, a two room school,

[TEXT CONTINUED ON PAGE 46]

102 361 621 368 497 621

and the homes of the ministers and the teacher. Standing 621 together, within a few hundred yards of each other, they 368 provide a focal point for the surrounding area. The remainder of the buildings which we normally think of as forming a village nucleus are widely dispersed. The post office, which 621 is also a general store, is just over a mile north of churches 364 and school, in the township of Kilvaxter. Another mile away, 368 off the main road, in Bornesketaig there is a small shop. South of the churches and school, almost two miles away, there is a shop and a smithy in Linicro. The remaining shops and workshops are similarly scattered hither and yon among the crofts.

Glendale shows much the same pattern of settlement. 361 Stretching along the shore of Loch Dunvegan, through Glen- 621 dale, on either side of the Hamara River, and out along the shore of Loch Pooltell, there are 156 crofts in 11 townships. These are the homes of 144 crofters. The total population is in the neighborhood of 350. Like the people 497 of Kilmuir, the Glendale residents have also become dependent on roads, and they have tended to build their new cottages near a road of some sort. The single church, the post office, 368 and the shop stand fairly close together near the center of 621 Glendale. One school is about a mile away in Borrodale, 364 and the other over a mile away in Colbost. Neither Glendale nor Kilmuir have a village hall. When the Glendale crofters have a meeting to discuss the club farm or when the Kilmuir crofters hold a club meeting, they use the school. Now let 621

Worth of a line between Lochs Sligihan and Eynort, Skye

terrain is encountered only in Trotternish and Duirinish.
rotternish the land has faulted and uplifted to produce a
ridge of cliffs which rise to 2,360 feet. The uplands of
inish culminate in MacLeod's Tables, a pair of flat topped
s (1,601 and 1,538 feet). This basalt area is Skye's best
cultural asset. The rock easily breaks down to form a po-
ially rich, light loam and the porosity of the basalt fa-
tates drainage.[2] Unfortunately, the potentials are not
ys immediately available. The heavy rainfall and configuration
he land prevents the accumulation of deep soils. In addition
hallowness, the marked common characteristics are lime,
phate, and cobalt deficiencies, acidity, heavy leaching,
water logging. An extensive, irregular overlie of peat is
ther restricting factor. Except for the western slope of
hill ridge of Trotternish and, to a lesser degree, some
s of Duirinish, blanket bogs of peat will not allow the
nutrients of the underlying soil to be brought into circu-
on. There are, of course, raised beaches and well drained
ces throughout the area with relatively good arable land.
relative fertility of northern Trotternish has been recog-
for many centuries. It has long been known as "the
ry of Skye."

[2]Darling, loc. cit.

133 South of the basalt plateau, the Cuillins
34 Hills have intruded into the lava. Although t
dominate the landscape for many miles, they ar
103 useless agriculturally. Indeed, a case might
derivation of the name Cuillin from the Welsh

133 The northeastern end of the peninsula is covered by glaciated,
134 rounded hills rising to 2,396 feet. The remainder is a low-lying area of soft rises and deep glens. The soil cover is largely no more than a physical medium. Were it not for stoney but light, well drained soils on several raised beaches and morainic soils derived from the mainland, large parts of Sleat would have no cover other than ice scoured rock. Peat covers many of the flatter facets.

Despite the multiformity of the physical appearance
133 of the island, one cannot help forming the impression of a
137 certain sameness. Except where bare rock stands out in stark relief or where man has laboriously turned the soil to agricultural use, the flora of Skye is primarily grass only occasionally interspersed with a few trees. In the glens and on the lower slopes of the hills fescue and bent grasses
[311] are found wherever the natural drainage is good. Both are tender and excellent for pasture. Poorly drained land supports coarse sedges and rushes. Above 300 feet moorgrass is found on dry facets and rushes and mosses on soggy ground. The high hills, such as the ridge of Trotternish, maintain a sub-alpine pasture of small flowers, mosses, and sparse grass. Obviously, the main factors governing the natural flora are drainage and
137 altitude. Man and his stock have also influenced the vegetation.
311 Selective grazing by sheep has allowed the spread of a large, tough fern, called bracken, which has markedly reduced the
137 pastoral value of extensive tracts of the best land. Another common plant is heather. True heather moors, however, are

us journey over to the "Capital of Skye" which stands on 621
Portree Loch.

The village of Portree, as stated earlier, represents the only successful attempt to introduce a nucleated settlement to the island. It was created by a landlord in the [656] early nineteenth century and has been fostered by the national and county government, especially within the last twenty years. Nothing has disturbed the English and the Lowland Scots more 621 than the alien nature of town life in the cultural heritage 648 of the Sgiathanach. Ever since the sixteenth century the Hebrideans have been resisting the introduction of villages. The Scottish and, later, the British, government has been only slightly less adamant in its determination that the country people should have a town, if not a burgh, come what may.

Indicative of its calculated creation, Portree has been 621 built "on the square," like so many English villages. Around 368 the square are found the police station, courthouse, and jail; 177 two banks and one private home; two churches and the Masonic building; and a hotel and two boarding houses. Equally indicative of the alien nature of the village, the square is normally used only when the people are going to or coming from their place of worship or business, or when they are entering or leaving Portree by the road which cuts across the square. The exceptions are an occasional civil ceremony and performance put on for the benefit of the summer tourists.

In reality, the village might best be described as an 621 overgrown hamlet, even though it was planned. The main function 368 of the village as far as the whole island is concerned is that

of an administrative center. The government offices, however, 621 are scattered about the village. One is down at the pier; 368 another is half way out of Portree on a trunk road, and still a third is tucked away on a side road down by the shore of the harbor. The post office is behind the court house, on the opposite end of the village, and the school, the only secondary school in all the Hebrides of the County of Inverness, is out of the village all together on another trunk road. For northern 621 Skye, Portree is the shopping center. The shops are along the 346 main streets which run off the square and along the road which leads down to the pier. All of them are in remodeled houses. For the immediate area surrounding the village, Portree is a 621 religious center. The churches stand together, except one 368 which is on the opposite side of the village; the ministers' homes are dispersed on the fringes of the village. Long ago 621 Portree was known as Ceilltarraglan, (burying place at the foot [103] of the glen). The old village was no more than a church, school, inn, and jail which stood overlooking the houses of a few fishermen along the bay. The surrounding area was given over to farming. The differing ages of the buildings show how the village spread along the bay, up over the terraces, out across the flats, and finally, with the assistance of the County Council which has built all of the new houses, on to the hill which overlooks the shops and the harbor. Although only the [161] jail remains as a sentinel of the past, the differing ages of the houses also tell how the population grew from a mere handful to 1000 in over a century and a half.

Social Organization

The Croft. Ideally, the croft is the home of a nuclear family. Social instability and economic limitations, however, have given rise to a situation in which the ideal is becoming progressively harder to attain. In fact, crofts which once were occupied by a three generation family group, that is, by grandparents, parents and children, are now inhabited by an aging bachelor, a spinster, or an unwed brother and sister. Others are the homes of an old widow or widower and, perhaps, one or two of their children who are well beyond marriageable age.

594 As an irremovable social entity, the nuclear family has been surrounded by the universally recognized functions of sexual gratification, economic cooperation, reproduction, and education. In addition, important functions of a religious and a social character have been given to it. The members share the work of the croft, have a higher rate of interaction than any other social group, and, in most homes, worship together seven days a week. Within the family, the father is the source of all authority. He directs the labor of his wife and children, determines their patterns of interaction outside the home, and leads them in family worship. The family's economic well-being and spiritual welfare are his responsibilities.

Learning the essential tasks necessary to the crofting way of life by imitation and informal guidance, sons move in the sphere of their father and daughters in the sphere of

their mother. While the father is the disciplinarian, both 594 562 children are expected to respect the wishes of their mother, except that a boy can never be asked to do the work of a women. At the same time, however, in the absence of a boy, a girl will take his place in the division of labor. The high status of the male and the subservient position of the female has persisted over the centuries. Always, male and female relationships are reciprocal and complimentary.

The patterns of interaction and the statuses and roles 594 which are manifest within the nuclear family on Skye are much the same as those described for the Irish small farmers.[15] The main difference is the occupation of the Irish farm by a three generation family group. Comparable family structures arefound in the United States among the old Order Amish and, apparently, among the mountain people of the Southern Appalachians, many of whom are descendents of Scottish and Irish migrants.[16] Under Le Play's classification, the Skyeman's family is the famille-souche or stem family.[17] Although strongly patriarchial, the family on Skye has been weakened by economic limitations. At the same time, the Sgiathanach, as a member of both a nuclear and an extended family, has not lost his attachment to the land, to his kinsmen, or

[17] See Loomis and Beegle, op. cit., pp. 57-59, 61-62.

to the traditions of the past. I shall discuss this further when I describe the extended family.

The Township. The township is a cooperating economic unit. Communal use of an interest in the common grazing lands gives the township its focus. Living on the several crofts, there will be found an aggregate of nuclear families and unmarried individuals who, especially in the older townships, are relat and re-related on both sides. Only in the more modern townsh does the degree of relationship become tenuous and finally di appear. In interpersonal activities the neighbors have a rat of interaction second only to that of the nuclear family.

The dominant social trait is the strong emphasis on the ascription of status on the basis of kinship, sex and age. There are no socially valued achieved statuses. The facts are simple. Males enjoy higher prestige than females, and th old men and women are respected by the youth. All of the sam age grade and sex are essentially equal. Again we have a parallel with the Irish small farmer.[18]

There is no room for the expression of a role of leadership in economic activities. The governing principle of township administration is so-called primitive democracy. Al males have an equal voice in determining the acceptance of any policy or action which concerns the group, and unanimous consent is necessary for the adoption of any change. Although each township has an elected grazing clerk and a grazi

[18] Cf. Arensberg, op. cit., pp. 45, 109-110; and Arensbe and Kimball, op. cit., pp. 63, 161-231.

exceptional. The largest is found in the glen between Portree and Loch Sligihan. Of the total area of Skye, approximately 447,000 acres, over 400,000 acres are rough grazing, incapable of being tilled.

The scarcity of trees is an environmental feature worthy of special consideration. More than the mere aesthetic appreciation of the traveler is involved. The lack of shelter is a crucial factor in limiting the variety of crops which can be grown. There are three "forests," but they are deer forests without trees and with very few deer. Wooded areas exist only where landlords or, more recently, the forestry commission have planted for amenity, shelter, and anticipated lumbering operation. Pollen analysis, from an archaeological find,[7] and stumps, discovered in peat bogs,[8] suggest. a once widespread natural forest of birch, hazel, elder, oak, and pine. All that remains are a few small areas of birch and hazel on peat-free slopes and on sheltered escarpments beyond the reach of the cattle and sheep, and some residual oak woods in Sleat. So sharp is the contrast of Sleat with the rest of Skye in so far as vegetation is concerned that this peninsula has come to be known as "The Garden of Skye." The proprietor has played his part in the creation of this impression

For the remainder of the population, as a general rule, it may be said that a person's status depends on personal qualities rather than on occupation. This is especially true of men who take an active part in the church. In terms of interaction, the social hierarchy is extremely fluid. People who elsewhere in Britain would be "working" or "middle" class not infrequently join with members of the "upper" class in both formal and informal social groups.[22] This underlying equalitarian pattern has always characterized the interpersonal relations of Skye's society. There is, of course, cleavage between the upper level of the society and the bulk of the population; intermarriage is impossible.

The social life of the village revolves around the newcomers and the landed gentry. In addition to the social circles based upon age, sex, kinship, and religion, the individual belongs to several small groups of friends and, perhaps, a few formally organized clubs. When the native-born take part in the formal activities they do so as participants rather than as organizers or directors. The necessary roles of leadership are left to the newcomers or to the landed gentry. The latter, in particular, are responsible for community affairs, just as the chief and his kinsmen were formerly looked to as the leaders of the people. Occasionally, an influential newcomer gives them able assistance. The influence of the old men is not as marked in the village as in the crofting communities,

[22] Roy Lewis and Angus Maude, The English Middle Classes (London: Phoenix House, 1949), pp. 13-26, 87-110.

mainly because there are enough young people to form a strong age grade of their own. The more liberal outlook of the villagers is, however, tempered by the old men.

Religion

The attachment to the past embodied in the social and economic aspects of the culture carries over into the religious life of the Sgiathanach. He is a Presbyterian who continues to worship and view the world within a pattern which characterized the Scots of the sixteenth and seventeenth centuries. The doctrine and theology are derived from the teachings of Calvin as interpreted by John Knox and refined by the Covenanters of the seventeenth century. To the original ethical code a strong measure of influence from the English Puritan movement has been added. The guiding principles are still foreordination and election. The dominant motivating factor is asceticism.

One of the outstanding features of the island today is the large number of churches for such a limited population. To serve the 8,600 people there are 21 churches with ministers and 13 mission stations. A hundred years ago, when the population was almost triple the present number, there were only seven ministers on Skye. The present abundance is the outcome of a series of religious schisms of the past century. There are now four Presbyterian sects. Of all the neighborhoods on Skye, only Glendale is religiously homogeneous.

Portree has three Presbyterian churches and, in addition, an occasionally used Episcopal church and small Catholic chapel for newcomers. Kilmuir has two Presbyterian churches, and the population includes affiliates of three denominations. In contrast to the pattern of schism in the United States and, indeed, in most of the Western World, the schisms on Skye have been due to a strong desire to maintain cultural conservatism. Each time a church has tended to become more lenient in official policy, there has been dissension and disruption. This does not, however, mean that the several sects are dissimilar in practice and outlook. In Scotland the local kirk is governed by the congregation in accordance with the democratic principles laid down at the Reformation. The people call their minister and elect the lay officials of the church.

Religion is of supreme importance for an understanding of the configuration of the local culture. In fact, beyond being a highly integrated and systematized pattern in itself, religion has come to provide a focus for the culture. Through the religious pattern the culture achieved a reintegration and found continuity at a time when the people were faced with the prospect of enduring instability, if not total social and cultural disintegration. Although it has the appearance of being an extremely negative institution, in that much of the former secular life has been circumscribed by clerical censure, religion has sanctioned the fundamental values and patterns of

behavior which have given the individual and the culture their ability to continue in spite of social instability and acute economic hardship. In many respects, the Skyemen's religion is strikingly similar to that of the Welshmen.[23]

The status of the father within the nuclear family has been maintained, despite changing economic roles which might have led to a loss of prestige, by his religious sanction. The aged men of the community, in particular the elders, the elected lay kirk officers, have been able to continue to exercise stringent control over their families and neighbors. In a negative way, the socially inferior status of the women has been maintained by debarring them from active roles in the church. In religious activity the people find meaningful patterns of interaction. The small congregations, rarely over 300 people, give the Skyemen a sense of belonging. In the home the practice of daily worship intensifies family interaction. Above all, at the semi-annual communion celebrations, highly emotional meetings which partake much of revivalism, the people find solidarity. As each church in turn celebrates the Lord's Supper, the people from the neighboring churches of the same sect come to share one to five days of worshipping together and renewing their ties of friendship. At the daily church services the people meet and hear visiting ministers of their sect and the eminent Men, members of the elect, from other parts of the island. The identical pattern is found in Wales where the intense patterns of interaction center around the singing festivals.[24]

[23]Rees, op. cit., pp. 114-130.

[24]Ibid., pp. 129-130.

Although the Sgiathanach accepts his religion without question, unless he is willing to abandon his cultural heritage for the outside world, many Scots are disturbed by the influence of religion on the lives of the people. It has become commonplace to call the people narrow and bigoted, and the people well know this, but if the Calvinist and Puritan ethic had not been developed with such logic and vigor, I probably would not be able to assert that through religion the culture has maintained continuity while the content has changed.

CHAPTER III

SKYE IN THE DAYS OF THE CLAN

If we are to understand the continuing distinctiveness of the contemporary culture, we must attempt to reconstruct the culture of the remote past and point out the plausible sources for the more distinctive traits and patterns which, upon becoming integrated, became characteristic of the culture. This chapter, then, is devoted to a description of the social organization, economics, and religion of the Sgiathanach before the influence of the commercial and rapidly expanding industrial society of Great Britain assumed significant proportions.

Sources of Information

There is an almost complete dearth of information about the internal conditions in the Hebrides before the eighteenth century, except for stray accounts of intrigues and rebellions against the Scottish Crown. A combination of causes is responsible. First is the relative lateness of the introduction of writing. Second, there is the fact that the Western Isles were held by the Norse from the ninth to the thirteenth century. Third is the destruction of Scottish records. The ecclesiastical

and, perhaps, the legal papers concerning the Hebrides were either destroyed by the Norse during their seeking of the monasteries or lost upon being transferred to Ireland for safe keeping. Edward I of England, as self-appointed arbiter of conflicting claims to the Scottish throne, and other claimants to the throne at home removed the rest. There is no record earlier than 1140. In fact, except for an Indenture Roll of 1292 and fragments of the Parliamentary Roll of Baliol, 1292-1295, there are no public records earlier than 1308, and Parliamentary records are not available until the Fifteenth Century.

Even when we approach more recent times, caution must be exercised. Shortly before the last Highland rebellion, 1745, an English army officer said about the remote and unfrequented Hebrides, "They are a very proper subject for invention; and few, I think, would have the curiosity to visit them, in order to disprove any account of them, however, romantic".[1] As far as I know, there are only four descriptions of the Isle of Skye which can be dated with certainty before 1700. The first is a brief description by the Dean of the Isles in 1549.[2] The second is a report on manpower and rents

[2]Sir Donald Munro, A Description of the Western Isles of Scotland, Called Hebrides (First Pub. 1549; Stirling: Eneas Mackay, 1934).

drawn up for the Crown sometime between 1577 and 1595.[3] In 1630 a short commentary on the social, religious, and economic life of Skye was penned.[4] Finally, at the close of the century a native son wrote the first detailed account of life on the island.[5] Thus, I have had to rely on stray fragments, gleaned from such material as can be found, and on later works. This is a handicap which may leave my interpretation open to criticism, but the statements of these authorities have been used to fill out the details of an established pattern only when their accounts are beyond reasonable doubt.

The Bare Bones of History

Although the Archaeological record for the Isle of Skye can be traced back as far as 2000 B.C., when Neolithic man became the island's first inhabitant, the evidence suggests a series of invasions and withdrawals by people at varying stages of development rather than a continuous local development.[6] Indeed, no one has uncovered any evidence for settlement between the fourth and seventh centuries. At the same

time, as we saw in the preceding chapter, archaeology reveals two significant facts, coastal set tlement and a pastoral agricultural economy are of great antiquity.

It is generally believed that the Scots arrived in the Hebrides from Ireland in the sixth century. Even though this belief rests on legend and some dubious early chronicles,[7] the sporadic mention of Skye in the Annals of Ulster between 501, when the people are said to be paying tribute to the King of Erin and Alban, and 794, when the Norse pillaged Skye, indicates some affiliation.[8] During this early period Skye may have been inhabited by a tuath (tribe), a number of which formed a mortuath (literally a great tribe) or province.[9] Be that as it may, the Norse who had come to plunder, an ambition that was stimulated by a conflict of Pagan and Catholic religious ideals, in the eighth century, began to settle in the Isles in the ninth. Since they had been driven out by Harald Fairhair, the first king to establish political unity in Norway, the petty earls proceeded to harass Harald's territories until an expedition reduced them and annexed the Hebrides to Norway.

Rait, An Outline of the Relations between England and Scotland (1500-1707) (London: Blackie and Son, Ltd., 1901), p. 24; John Cameron, Celtic Law (London: Hodder and Stoughton, 1937), pp. 169, 177-178; and Charles S. Terry, A History of Scotland (Cambridge: Cambridge University Press, 1920), pp. 36-37.

Whether or not the Norse destroyed the tribal organization of the Hebrides, as they did in the Orkney and Shetland Islands and in Caithness, is not certain.[10] Certainly, their political control was never firm. The subjects were a warlike group of freebooters ready to join any adventurer who held out the lure of plunder. The earls were given to intrigues and internal conflicts. The king's viceroys often made his wishes subservient to their own ambitions, and when they were able to form alliances with the Hebridean, they proclaimed their independence. The subject people were restless. Throughout the twelfth and early thirteenth centuries the men of Skye took part in a series of assassinations and battles in an effort to expel the Norse. Finally the Scottish nobles entered the fray. In 1266 the Western Isles were ceded to Scotland.

During the more than four hundred years of Norse occupation, the Scottish monarchy was gradually evolving. In 843 the kingdom was united. Following the former invasion of England, Scottish political and religious organization was remodeled in form and content. A Saxon court and the Roman Catholic Church were introduced. Saxon replaced Gaelic as the court language. By the end of the reign of David I (1124-1153), Scotland had become a feudal monarchy.[11] There was the concurrence of the three basic elements: personal relationships based on commendation or contract, private jurisdiction, and hereditary noble

[10] For details concerning the Norse occupation, see Donald Gregory, The History of the Western Highlands and Isles of Scotland (London: Hamilton, Adams and Co., 1881).

[11] See, e.g., Terry, op. cit., pp. 24-37; and Rait, op. cit., p. 204-212.

tenure in vassalage.[12] By the time Skye was placed under the suzerainty of Scotland, the old tribal organization had completely disappeared, and the nation was early governed by a hierarchy which imitated English use. There was, however, an important difference between the feudalism of Scotland and England. Although the landed aristocracy was Anglo-Norman, the Normans had not conquered Scotland. They were unable to work out the refinements of feudalism, especially the manorial system.[13] There was also an important difference in the form of the two governments. The Scottish king granted his charters and ruled with the advice of his bishops, earls, and barons, leaving the Parliament almost devoid of power, while in England Parliamentary government had been firmly established when the two nations were placed under a common monarch. Nor did the Scottish Parliament become any more important when it was united with the English body in 1707.[14]

It is against the background of this varied history that the local culture must be viewed. We may expect to find features which are traceable to the old Celtic tribal organization, Norse influence, and Scottish feudalism. English influence would have appeared too late to be counted as a factor in the moulding of the culture, and the adamant dislike of the Highlanders for the English, evidenced by their successive rebellions and their persistent efforts to support

[14] Terry, op. cit., p. 37.

the Scottish kings against the demands of the English Parliament, would have restricted English influence to a negligible role until the final Highland uprising was crushed in 1745.

Social and Political Organization

The characteristic unit of the social and political organization of the Isle of Skye during the Feudal period of Scottish history was the clan. All who have theorized about the clan agree that it was a social, political and economic entity. There is, however, no simple, universally accepted interpretation of the nature of the clan. Unfortunately, interest in its structure and function is late. Many assertions suffer from the prejudices and sympathies of the authors toward the Highlands at the time of the eighteenth century rebellions or the nineteenth century land clearances. Lacking Scottish sources, historians turned to the Irish codes of law and imposed them on the clan system without asking whether or not four centuries of Norse domination might have resulted in at least a partial assimilation of the old Celtic tribal organization with the Norse political organization. Nor has allowance always been made for internal development during the five centuries in which the clan was the distinctive organizational unit. Today historians are almost apologetic about the Highland clan system. The subject has become the province of amateur antiquarians.

Anthropologists apparently look upon the clan as a social unit hardly worthy of comment. As far as I know,

Morgan stands alone in believing the clan to have been a true gens in organization and spirit.[15] He saw in it the typical disintegrator as the feudal order decayed.

Features of gentile society, vitality of gens life over the members in moulding individual character, feuds and blood revenge, localization by clans, common use of the land, fidelity to the chief and each other, and descent in the male line. Rivers viewed the clan as more nearly a tribe.[16] Piddington denies the Highland clan the status of a true clan because, although patrilineal, it has never been shown to have been exogamous.[17] I have no doubt that most anthropologists would agree with Piddington on similar grounds. Linton has recently compared the Polynesian tribe with the Highland clan.[18] He seemed to share Rivers's view, saying the clan was localized by territory and was normally endogamous.

The Clans of Skye

Although some historians, probably reasoning from pre-Norman Gallic organization, believe the clan was inherent in the Celtic tribal system,[19] most date the origin of the Highland

clan as not earlier than the reign of David I.[20] It appeared after the introduction of feudalism, and, as we shall see, it disintegrated as the feudal order decayed.

Had the tuath and rathuth persisted under the Norse, there was no room for them in a feudal polity.[21] On the other hand, there was no opportunity to assimilate the remote Highlands and, especially, the Islands with the Lowland half of the kingdom. For over four hundred years no king, Scottish or British, was able to secure an unfluctuating vassalage of the Highlanders. Whatever course events took, the morsear, once chief of the mormuin, the toiseach, the old chief of the tuath, and the mor, a subordinate chieftain, were gone. In place of the tribal arrangement there appeared a host of distinct communities of fate. On the Isle of Skye the most important of these were the Sell Torquil (MacLeods of Lewis), Sell Tormod (MacLeods of Dunvegan), Clann Finnon (MacKinnons), Clann Nicholl (Nicolsons), and Clann Hisdein (MacDonalds of Sleat).[22]

Clan Membership. The clan was a means of administration and security.[23] The nucleus was a derbfine, a four generation

[20] See, e.g., Robertson, op. cit., pp. 304-305; and Rait, op. cit., pp. 204, 210-211; Skene, op. cit., Vol. III, pp. 303, 307.

[23] See, e.g., Thomas Innes of Learney, The Tartans of the Clans and Families of Scotland (Edinburgh: T. and A. C. Johnston, 1938). This authoritative work was written by the Lord Lyon of Scotland, the custodian of Scottish heraldry. Other standard treatises consulted were: Frank Adam, The Clans, Septs and Regiments of the Scottish Highlands (New ed.; Edinburgh: W. and A. C. Johnston, 1952); and W. D. Mackenzie, A Short History of the Scottish Highlands and Isles (Paisley: Alexander Gardner, 1906).

patrilineal family group whose members, in theory, were able to trace their descent from the founder of the clan, the source of the clan's patronymic. The membership was expanded by including descendants of members of the derbfine beyond the third descending generation. Thus, the size of the clan grew in proportion to the natural proliferation of the descendants. Numerical strength was further augmented by the inclusion of dependents. Small groups attached themselves to powerful clans by a contract of man-rent. The senior member of a derbfine accepted the adopted chief as the superior of himself, his sons and brothers, and their heirs and agreed to obey the chief in all lawful duties, excepting those conflicting with the obligations of kinship.[24] The clan was further recruited by the adoption of broken men, individuals cut loose from their own clan for punishment, and, on occasion, native men, the former inhabitants of newly acquired territory.

Large clans contained a number of septs. The sept was essentially a small clan within a clan. The distinguishing feature being that the nucleus of kin were related to the common ancestor through a younger son of the founder or one of the younger son's lineal descendants rather than in the direct line of descent. In addition to the patronymic, the sept bore a territorial title. Some septs became strong enough numerically to acquire their own territory and rank as independent clans. Others, due to the loss of territory or the need for

[24] Cf., e.g., Lachlan MacDonald, "Gleanings from Lord MacDonald's Charter Chest," Transactions of the Gaelic Society of Inverness, Vol. XIV (1889), pp. 63-72. Hereafter, I shall cite these transactions as TGSI.

protection were absorbed. Clan strength was also reinforc by the existence of dependent clans. Unlike the septs, de pendent clans retained their identity and their territory, while entering into a security pact.

Once the clan system was established, there were few individuals without allegiance to some chief. The individu status and protection depended on clan membership. An indi who could not name his chief had no dignity. Thus, under t Law of Arms of Scotland the clan is described as an agreeg families actually descended, or accepting themselves as des from a common ancestor.[25]

The Clan Chief. At the head of the clan stood the ceannai (literally the head of the kin), the living representative the common ancestor and the group. While giving the clan coherence and endurance, he served as the military leader, protector, lawgiver, arbiter, judge, and administrator of t community of fate. His power and position, backed by a res body of supporters, was almost independent of royal authori He did not, however, enjoy absolute power. The obligation consult the leading men of the clan on communal affairs tem his rule. He was a patriarch who governed by custom and co consent. Always, in a general sense, he was the father of t people. His government rested on reciprocal relations. The chief and the clan brotherhood mutually owed and received devotion. Right or wrong the clansmen were sheltered and defended in quarrels by their chief.

the fourth degree of relationship. Although the extended family is now rather amorphous compared to what it must have been a century or two ago, it is still very real to the Sgiathanach. Once, perhaps, the townships and their historic antecedents were patrilocal settlements. Then, of course, the question of the availibility of land and the legality of subdivision were of small importance. Now the rigid system of land use enforces neo-local post-marital residence, often at a great distance from the parents, and very often means that the younger generation must join the constant outward movement of the population. Thus, the extended family is seldom, if ever, found intact. Indeed, the only times its members come together as a group is at a funeral or a wedding. On these occasions the strong patrilineal emphasis becomes apparent, and the fact that the individual always remains a member of his or her family group is revealed. It is, then, a stem family.

In structure the extended family includes all males and females out to, and including, third cousins. The kinship terminology is descriptive. Excepting grandchildren, all relatives are distinguished by sex and generation. Members of the parental generation and lineal descendents of the parents collateral kin are distinguished by their relationship to the individual's parents. Members of the grandparental and great-grandparental generations and their lineal descendents are similarly distinguished. The same descriptive technique extends to kinsmen of the first and second descending generations.

In the absence of terms for in-laws, these relatives are simply 596 601
referred to as the husband's or wife's kin. Hence, structurally, the extended family on Skye is comparable to the Irish system,[19] and, obviously, is dissimilar to our bilateral family structure.[20]

Because the extended family is so very unstable, it is 596
difficult to describe it functionally. There was a time when the people were divided into three communities of fate, the members of which were bound together by the bonds of real and fictitious kinship. Today individuals whose remote ancestors stood together in defense of their homes may not have seen their brothers in many years. The material I gathered allows only two generalizations. Any member of the extended family is always free to call upon his kinsmen for help or, at least, hospitality in need; and the closest surviving relatives always know their obligations and are ready to fulfill them. Thus, the family is a mutual aid group. The primary responsibilities of the kin are to see that all have food, shelter, and a proper burial.

There are additional social circles in the crofting 561 888 626
community. The youth, young adults, and the aged are divided into age grades. Of these, the age grade of the old men is especially important. They control the economic progress of the island by their deliberative function concerning any innovation in the crofting system. Whether it is a suggested

tradesmen are respected, but since most are crofters, they are 554
treated like all other men.

The Village. The village contains a heterogeneous population. 621
At least a third of the families have arrived in the recent 162 167
past. They have come to fill positions in the county and
national government offices; in Lowland directed banks or
business houses which have extended their field of operations
to Skye; and in the professions as doctors, lawyers, ministers,
and schoolteachers. A few have come to Skye to open a shop or
offer their services as tradesmen. The remainder are either
Skye folk who have recently moved into the village to see
employment or families that have been in Portree for one or
more generations. Very few families seem to have lived in
the village for more than three generations.

While there are many opportunities for an individual to 554
achieve status in Portree, the cultural heritage and the 184
economic limitations under which the Sgiathanach labors has
not allowed him to compete with the newcomers. His ability
to compete is further restricted by the prevailing policy of
the government and the national corporations to bring in
managerial and, often, clerical personnel from the outside.
All share one socio-economic trait; they are non-crofting. As [565]
yet there is no class structure beyond the polarity of the
landed gentry and the crofters who participate in village life.
There is verticality. Highest prestige status is accorded to
those who have been accepted among the local aristocracy. Be-
low them rank the ministers, doctors, and school teachers.

There are conflicting views on the question of succession to the office of chief. It is frequently said that chieftainship is hereditary within the nuclear derbfhinn, but it was described the clan for their benefit, at least until the feudal order came to make inroads. Thus, succession was by collateral descent, and the principal of succession was tanistry. The heir, or, was elected during the life of the chief from the oldest the fittest males. This meant that the chief was succeeded either his brother or his nephew. Although the preference collateral relatives was found in pre-Feudal Scotland, land, and Wales,[73] it became that primogeniture appeared in Hebrides at an early date. A search of the family pedigrees the Hebridean chiefs failed to disclose a single case of her collateral descent or election.[74] Eldest son succeeded her with regularity. As far as tanistry is concerned, the mention of a general rule of tanistry in pre-Feudal Scotland Ireland has been shown to be unfounded.[75] Moreover, the tion of manrhinn, an inter-family contract under which the of one clan lived with the daughter of another chief for ever with continuation depending on pregnancy, would have ved to absolve lineal a recession rather than collateral descent rive through tanistry. At the same time, however, the prong the extent that the eldest male child lived in absolute descent,

[73]Frank Adam (op.cit., pp. 21-26) supports this position numerous arguments throughout his work.

[74]Gerald Gordon, op.cit., p. 178.

175 chief and to be accepted by his clansmen. Normally, he was succeeded by a son or a brother, but the practice of electing a younger man in preference to an elder was for the purpose of seizing their cattle by open force. Obviously, in my mind, is best understood as an hereditary dignity claim was dependent upon the family given allegiance of the clan members. Should his power become too arbitrary, the people could either withdraw, placing themselves under a new chief, or support another claimant's attempt at assassination.

Another problem connected with the position of the clan chief is the question of communal ownership of the land. Some authorities regard the chief as an administrator of the clan territory, holding it in trust and using it under custom to distribute it to his vassals and kinsmen. Others, on the principle of tenure was, it is said, revolution, a form of family inheritance, under which all clansmen had a right to a share in the land. If this was so, the rule implied joint possession of the land when feudalism was extended. There is very little evidence to support this position. There is no evidence that purely communal ownership of the land existed anywhere in pre-Feudal Scotland or Ireland.[77] In the Hebrides, three laws of land tenure had been established by the thirteenth century to the extent that the eldest male child lived in absolute descent,

[77]Curtis, op.cit., p. 165.

[78]Ken Cox, op.cit., pp. 26-29 also substantiates this argument.

without fealty or service.[78] Under the attenuated feudalism on the lands of the Isles introduced following the expulsion of the Norse, the chief's relationship to their clans to which they dominion. After the Crown finally broke the Lords of the Isles, who had obtained possession of all the Western Isles and much of the mainland through matrimonial alliances with the Norse viceroys, and Scottish early, as well as by arms conquest, almost all the Hebridean chiefs accepted charters from the Crown on service of ward and relief.[79] Those who failed to do so became tenants, forfeiting all claim to the land, because, under Jacobite, all feudal superior inconsistent with the principles of the Crown were ignored.[80]

Nevertheless, the chiefs who accepted their feudal status continued to administer to the clan under the old tribal usages. Gaeldom tenure was not abolished for the tenants of the manor derbfhinn, who received an allotment of land from their ruling kinsman. As we shall see, the land and no commercial value, and, therefore, was freely given to all ready to accept tenure and acquisition of service. Feudalism and clanship reinforced each other.[81] Under both possession of the land depended on pedigree. While the king could alter the feudal pedigree by forfeiture and regrant, the clan chief's pedigree depended on the

additional elements of kinship. While the feudal custom of marriage, resignation, regrant, and wardship, a mortgage of the land on security of the rental, secured the possession of the clan chief's family, extra-legal tribal custom secured upon by force. The general will of the clan elected the chief as a patriarch; the laws of the kingdom supported him as crown vassal. Each chief was surrounded by hereditary officers of dignity whose number was a mark of the individual's status. These included pipers, marshalls, stewards, standard bearers, and armed retainers. There was also a seannachie (bard), who kept the pedigree of the clan, declared descent of clan members, and chanted clan traditions. Some chiefs had an official bard (Fadgie), but more often the chief, who had hereditary jurisdiction, and some of his principle men, including a baron-bailiff, sat in judgment. According to a minister of Kilmuir parish,[82] both customs and new statutes were reduced to writing around 1670 and proclaimed annually at the church doors. Although the chief lacked the jurisdiction of a Feudal Baron, the government was loath to disturb his tribal jurisdiction, which depends on the composition of the clan, because tenants recognized the stability of the tribal law and the impossibility of interpreting the remote islanders with the national system of justice.

In return for their service the officers of dignity were given a grant of land, and they were free to call upon the

[82]J. G. Dunlop, "Social Life in Skye from Legend and Story," PSAS, Vol. XXX (1933), pp. 260-290.

clansmen for food and lodging whenever their duties took them away from home. The decay of the clan system can, perhaps, best be seen in the disappearance of several of these offices and prostitutions placed on others. By the seventeenth century, after falling in a school in Lochgoilhead Hebrides by the extirpation of the rude, barbarous, and uncivil peoples, the crown succeeded in forcing the chiefs to give up their heads, to assume full responsibility for the obedience of their followers to the laws of the kingdom, and to limit their armed retinue to a small personal bodyguard.[83] Clan warfare ceased and the chief's henceforth gave unswerving support to the Stuart kings, at least against the English.

The Duties of the Clan. Below the chief of the larger clans ranked the commoners, (literally the head of the house). They were the brothers of the chief and stood in relation to the kept at the chief stood to the clan. In the MacDonalds of Sleat the eldest brother usually held the lands in North Uist. In the Chiefdom of Dunvegan the eldest brother received the farm of Trollisker.[84] As senior members, the elders ruled the clan on marriage and held the principle post of honor in battle. They served as stewards, collecting the revenues of the estate and fulfilling the duties of the chief during his

absence or incapacity. The minor cadets also acted as tutors of the heir in the chiefdom, and the clan or successed while a minor, as guardians. The cadets bore the surname of the clan and had a territorial title, for example, Macleod of Talisker or Macleod of Raasay.

The Country of the Clan. The much lower level in the hierarchy consisted of the duine-uasale (literally the high people). The chief established his younger brothers, sons, and other near relatives, those within the derbfhinn, on the land. They had farms by which amounted to leases for a term of years. At first the leases were typically for three lifetimes, but by the seventeenth century they had been reduced to the individual's life plus a number of years to begin on the decease of the holder in favor of his son.[86] At the expiration of the lease, a nearer relative was commonly favored with the farm. The former holder either sought a military career abroad, in Holland or France, or entered a living by gaelic begging.[87] In the Chiefdom of Dunvegan the eldest brother received the farm of Trollisker. As senior cadets, the elders ruled the clan on marriage and held the principle post of honor in battle. They served as stewards, collecting the revenues of the estate and fulfilling the duties of the chief during his

the local representatives of the nuclear derbfhinn. They were appointed by the chief, their recognition depended on the willingness of the clansmen to form a following either them or title or a right of succession. The following determined how large one the chief could bring into battle and how many officers of dignity he could support from their contributions.

The most important function of this group, of whom could trace a descent within the central family, was their bringing the clansmen with them through all clans. They formed a ministry to the chief and were the counsellors of the clansmen. The bond with the former was private kinship, with the latter, a sense of kinship. They were the salaxtay of the system. When the colleagues into debt, a frequent occurrence, the tenants came to their aid by pledging themselves to preserve the family and the estates, to reduce the debt.[88] They were also the local merchants, an important function in an area with only sub-annual markets and scarce money.

The Commons. The clansmen (literally the children) included all within the jurisdiction of the clan chief. Their relationship was real by fictitious kinship, tenancy, or contract. To the Lowlanders and the English, their relationship seemed to be a

[87]Cormick, op.cit.

service and object obedience approaching deification.[89] Until the early travelers never ceased to be astonished at the familiarity with which the chiefs treated their people, although at the chief's partaking of the people's dry-bread, and assumed that the chief would claim time by the land whenever he cut them.[90] At the bottom, the system was equalitarian. Every man had the right to address his chief and call upon him for support in times of adversity.

The clansmen were continuously recruited by natural increase, adoption, and the gradual subsidence of the younger members of the minister derbfhinn into the body of the clan. The downward mobility of the remote collateral relatives of the chief was of particular importance. It reinforced the belief in kinship of the clansmen and the chief. The feeling of kinship was further reinforced by the institution of fosterage, a practice common to pre-Feudal Scotland, Ireland, and Wales.[91] Under fosterage children were exchanged between families of equal status and, after the age of five, the heir of the chief or tacksman was given to one of the clan to be raised and educated. Fosterage served to form mutual alliances between families and clans, to ensure the loyalty of the people for their chief, strengthen the attachment of the chief for his followers, and bind the

[91]John Cameron, op.cit., pp. 62-68.

members of the clan to each other.[92] Strong attachments were thus formed between the foster brothers. Often the foster brother later acted as the henchman of the future chief.[93]

The clansmen were also bound to the land by the tenure of the chief as subtenants or outlets of the tacksman and joint tenants. In return for the land, the subtenants owed their superior the duties of gain, a fixed payment in kind, corvees, a contribution of food for the maintenance of the chief and his retinue, feasts, an obligation to follow the chief in offensive war, and blanch, an obligation to attend the chief for defense.[94] These burdens were aleved by tribal Scotland and Ireland.[95] When a chief gave a farm to a tenant, whether for one or more years, it was customary to give the tenant a stick of wood and some straw.[96] This was immediately returned to the master. Both parties have been obliged to fulfill their respective obligations as if they had signed a lease or deed. There were additional duties on the land.[97] Upon the death of

a tenant, the chief was entitled to the best horse or cow as a payment for the continuation of the tenant's family on the land. The tenants were also required to give hospitality to the chief's bodyguard.

In this group, the clansmen, was found the essence of the clan system and the basic principal of the territorial tie and the bond of affiliation of kinship by commonality and affinity. The soil was not the mere spoken of subsistence; it was the ancestral home. Death to the subversion of the crown, the clansmen frequently espoused the tribal tie.[98] These clan lands were defended fiercely and the clansmen displayed no support their leadership chief, even when placed under a feudal overlord. The belief in kinship conflicted with the obligations of mere tenantry. Thus, the MacLeods held Trotternish by charter, but the MacDonalds held it by tribal custom. Attempts to enforce the Scottish Parliament laws in the Highlands, some proprietors were able to bring out their tenants for national defense, but they could never be sure whether or not the people would submit; there ever the claim of their feudal superior in favor of their lawless chief, who could not be diverted of his hereditary privileges as a patriarch.

Not a great deal is known of the kinship system among the clansmen. Undoubtedly, the people were grouped into a sept-like organization. To a senior member of an earlier, kinship and patriarchal authority over his kinsmen and represented them in clan affairs just as the flath had in the pre-Feudal period.[99]

[98]Cf. Bell, op.cit., p. 204.

It is by no means insignificant that despite a large degree of Norse influence in political and economic life, there is only a little vague evidence of a linguistic nature for Norse influence on family life.[75] There are very few words pertaining to the family which can be traced to a Norse derivation. In battle the clansmen stood by extended families, brothers and their sons fighting together. The importance of the *davhfhr* as a social unit can be judged from the following statement in an argument between two men, if one were to swear by the father of his adversary, it was a great indignity; but if one were to cast a reflection on the father and the grandfather of the other man, the next word would be accompanied by a blow.[76] He would have been named after his grandfather for the *clann* used genealogical strings.

Summary. The clan was a composite organization. From the old tribal organization it took the *davhfhr*, four generation extended family, the territorial tie of the group, and the mutual, reciprocal obligations of service, support, and defence. Under the Norse, additional descent as a system of inheritance of the title and land of the tribe displaced but the tribal principle of *gavelkind*, by which the land was divided among the members of the *davhfhr* who in turn divided the land among their real and fictitious kinsmen, persisted. Scottish nonmanorial feudalism

[76] Martin, op. cit., p. 179.

provided the framework within which the functions of the tribal leader and the spirit of the clan brotherhood could be preserved and extended. The family possessions could be secured by law and the clan system could be stabilized. At the same time, however, the tribal tie remained paramount in the local spirit. The general will of the clan backed the chief as the patriarch, and kinship, however vaguely, conflicted with the obligations of mere tenantry.

The chief was the living representative of the common ancestor of the group. He gave the clan coherence and esprit-de-corps; his leadership was almost independent of royal authority. Backed by a roaring body of supporters, he governed by custom and general consent. His jurisdiction flowed from his patriarchal position and depended on the recognition and cooperation of the clan. To secure his position and maintain the belief in common kinship, the chief planned his collateral and lineal descendants on the land. These men, either cadets of the clan or tacksmen, held their land by lease. They were the local representatives of the central family. They must important function was bridging the cleavage which ran through the clan by forming a ministry to the chief and supporting his dignity and by being the counsellors of the people. The crucial subordinate of the members of the central *davhfhr* through the tacksmen into the body of the clan reinforced the belief in kinship. The belief was further strengthened by the custom of fosterage, the custom of giving a son to one of the clan to be raised and educated. The clansmen were the embodiment of the clan system. They were given land as joint-tenants of the chief or as subtenants

of the tacksmen. Here was the essence of the clan system, the common tie of territory and kinship. The land was not the property of individuals, it was the ancestral home.

The clan was strongly patrilineal. The kinship of the individual family stood to his children as the senior member of the *davhfhr* to his kinsmen, the tacksmen to his tenants, and the chief to the body of the clan. The fundamental underlying principle was mutual, reciprocal devotion. The system was equilitarian. Although the chief was the landowner, and the tacksmen received their land on lease, for which they owed the chief the duties of service and a rent paid as their tenants owed the tacksmen, the land had no commercial value, but was an ill defined and secondary consideration. The kinship of the clan depended on the number of supporters, who could be maintained on the land under the system of land use.

Economic Activities

The principles of land use and tenure on the Isle of Skye up to the early years of the eighteenth century were similar to those prevailing all over Highland,[77] the land was under a system of runrig agriculture. The word runrig appears to be a modification of the Gaelic *roinn-rithh*, a parallel or running division. The bulk of the population, as tenants of the land

[77] Gordon Gray Crawford, The Agricultural Revolution in the Highlands (Edinburgh: Oliver and Boyd, 1939), pp. 1-2; Alexander Mackenzie, The Highland Clans of Kintail and Lochalsh (Inverness: Northern Chronicle Office, 1922), pp. 100-101; Alexander Mackenzie, The History of Kintail (Inverness: Northern Chronicle Office, 1894), pp. 60-61; Alexander Mackenzie, Antiquarian Notes on the Highlands and Islands (Edinburgh: Publication Committee of the Celtic Society, 1889), pp. 1-2; Alexander Mackenzie, Antiquarian Notes on the Highlands and Islands (Edinburgh: Publication Committee of the Celtic Society, 1889), pp. 1-2; John Dodgshon, Land Use in Medieval Scotland (Aberdeen: Aberdeen University Press, 1981), pp. 1-2.

owning clan chief (or Lowland aristocrat) or subtenants of the tacksmen, were clustered into hamlet-like farming settlements to exploit the arable, pasture, and grazing lands by individual and cooperative efforts. The land available for cultivation was divided into infield and outfield. Since Ireland and Wales continued to use shifting arable, the Highlands accepted permanent arable in the Middle Ages, the practice of dividing the land into separate allotments must have been introduced by the Norse. Norway continues to use infield and outfield to the present day.

The infield, about one third of the arable land, was fertilized continually with the aid of manure. The outfield was worked until exhausted and then left fallow while a new piece was brought into cultivation. Both were split into "ridge," irregular strips about twenty feet wide and several hundred feet long, separated by "balks," any uncultivated patch. Each man had at least three rigs for his use. Annually, all exchanged at least one rig with the other holders by ballot. Since all of the land was not of equal value, this periodic redistribution gave each man an opportunity to have the use of the best soil every three years. The use of the pasture and fraiter lands was regulated by a system of common rights. The stock of each individual was proportionate to his share in the arable land. When arbitration was needed to decide questions of allotment, grazing rights, or rent, a "Birlay court," composed of the share-holders and their elderly counsellors, was held. Economically, each farm appears to have

been more or less autonomous and self-sufficient. Significantly, the names of these farms, as most place names for lochs and headlands, are Norse.[78]

The Crops and Their Care. The crops of Skye were essentially those introduced during the Middle Ages. The staples were oats and barley. The local varieties were unproductive in comparison to the varieties common in the Lowlands, but they were regarded as be hardy against the wind and rain than the more productive grains. A little flax and hemp was grown, but not grown for local needs. Only the chiefs and a few tacksmen had kitchen gardens; most of the people grew no vegetables.

Although cultivation was of secondary importance, it was basic to the economy. The land was prepared by a large and cumbersome four-horse plough or a small foot plough. The foot plough, called the *caschrom* (literally the crooked foot), was the most common implement on Skye. In a naturally curved oak or ash shaft, a long, flat coulter with an iron shoe was fastened with iron rivets. At the junction of the head and the shaft a wooden peg was inserted for the foot. Although it was slow and laborious in use, the *caschrom* enabled the user to get better yields from his rigs than by ploughing. The many it was the only means of lifting the soil, unless a tacksman ploughed the small, rocky strip for his tenant. In terms of

[78] Henderson, op. cit., pp. 133-133.

[79] The following description, which otherwise documented, is drawn from the [illegible] of a letter dated Glasgow, 1st March 1811, from Lord Macdonald to Sir Walter Scott, in Lockhart, Life of Scott, Vol. [illegible], p. [illegible], as described by John Dalziel, Edin., Vol. XXVIII (1910), pp. 101-130.

man hours, twelve men using the *caschrom* were able to turn one acre in a day, roughly the equivalent of the work of one plough and a man. A man with the *caschrom* could plough half an acre to sow a peck of oats or half a peck of barley. The yields from land prepared with the *caschrom* were about 16:1 for barley and 5:1 for oats compared to 12:1 and 3:1, respectively, on ploughed land.

While cooperation was an advantage when using the *caschrom*, the heavy four-horse plough required cooperative effort. The operation took four men, each of whom supplied a horse. One man held the plough; another led the horses; a third went ahead to remove thistles and stubborn weeds, and a fourth followed after to lay down the sides of sods. Frequently, a *gaisgeach*, or land breaker, a rise-like instrument with six stout wooden teeth had to be used to break heavy clumps.[80] On heavily overgrown land a small fluke plough, a light machine with a sickle-shaped coulter, had to be used before the soil would yield to either the plough or the *caschrom*. After ploughing, the land was harrowed with a wooden implement with two rows of wooden teeth and a mortar brush. The harrow was drawn by a man harnessed with a horse hair rope or it was dragged by a horse's tail.

To facilitate drainage the rigs were ridged up high in the centre with soil from the furrows on either side and were ploughed lengthwise to allow natural drainage. The result was that the lower edges were worn by stagnant water while the crown was leached and often excessively dry during the early growing

[80] James Macdonald, General View of the Agriculture of the Hebrides (Edinburgh: Blackwood and Sons, 1811), pp. 134-137.

seasons.[81]

After ploughing, the infield was covered with sea weed. Some used old house thatch, mixed with dung, but there was a belief among the Skyemen that fresh green thatch from houses caused jaundice if made into reliable manure. The outfield received no manure. After three years of use, it was left fallow for seven years. Oats were sown in April or May and barley in early June, using the worst of last year's crop for seed. A potation of barley, oats and oats was generally made sown on newly ploughed land were believed to cause internal disorders in those who ate cakes or cream made from them.

The rigs were left untouched from sowing to harvest. There was too much else to occupy a man's time. Until 1650, and no doubt later, cattle forays and interclan wars kept them busy. The peat for the household for the following winter had to be cut. The cattle were moved to the hillside pasture and shepherded. Droves of cattle were taken to the southern markets. Fishing took a great deal of the men's time. Dogs, regarded as a consequence of Adam's fall, were not only untouched but paid were taken to leave them standing at the harvest. Except for a few earlier dogs, there were no enclosures. Animal depredations were common. One recently reported on Skye was to bring too depredating cattle to the limit of the field and drive blood from each of them.

The harvest was late, normally in September and October on the few dry days. Oats were cut by the sickle using a sickle.

[81] Cf., e.g., Donaldy, op. cit., p. 57.

Barley was pulled by the roots. The oats were either dried in a kyre or built up in a stack near the house or in the usual as needed. The process of drying was known as *kiloning*. A woman took a handful of stalks and set fire to it. As the husks burned, she beat the grain with a flail, a stick or bunch of heather. Using *kiloning*, it was possible to arrest, winnow, grind, and bake the oats cakes within an hour. Kilns came into use in the late seventeenth century, but kiln dried grain was considered inferior to grain prepared by *kiloning*. A few water mills had also been built at the close of the century, but they were also unpopular. The barley was stripped from the stalks, which were used for house thatch, and ground in a stone mortar for griddle cakes or, later, for whisky. The dry, like much of the oats, was used as porridge.

Stock and Its Implements. The Skyeman, in contrast to the Lowlander, was primarily a pastoralist. The stock included a small, hardy, shaggy breed of cattle well adapted to the rough terrain and scrubby pasture and sturdy ponies, a small, narrow-fleeced sheep of limited value for meat or wool, geese, and pigs. The importance of the cattle can be judged from the valuation of the farms. Although the three system of land measure had replaced the pre-Feudal Scottish measure known as a *davach*, the amount of land required to support ten head of cattle, with a contrary measure of four lands, which were divided into pence; lands and seisin units based on

enterprise of these fishermen who were active on the west 175*
coast.[80] In 1586 the royal burghs complained against the ex- 226
cessive tariffs imposed on fishermen by the leading men of Skye, the general hindrance of the people, and the theft of boats and gear. Similar complaints continued through the early seventeenth century. The chiefs insisted they had a right as heritors to impose duties. In 1622 the Island chiefs agreed to desist from stopping, impeding, molesting and oppressing fishermen, to protect them from harm by their clansmen, and to be answerable for their people. It made no difference. The people probably gave the English, French, and especially the Dutch, who were the main competitors in the Hebrides, as much trouble.

The Skye inhabitants had a deep regard for the sea.[81] Fishing was surrounded with many prescriptions. A quarrel on the coast, in particular if blood were drawn, would send the herring away for the season. Any landing place which freed them from the dangers of the sea was not to be defiled. Many carried a piece of turf with them when at sea. Upon putting to sea, the ship was always blessed, by invoking the Holy Trinity for protection and safe conduct. Prayers were also said when a sail was hoisted. Some took special care to turn a ship sunwise. These practices show a curious amalgamation of the early Druidical worship and Catholicism. Norse influence is apparent in all activities regarding the sea. The

*175 Skye galleys were similar in construction to the Norse ships,
226 and the majority of terms referring to the use of the sea are of Norse derivation.[82]

*175 Summary. The bulk of the population, as tenants of the land-owning chief or subtenants of the tacksmen and joint tenants, were clustered in hamlet-like farming settlements to exploit the arable, grazing and pasture land by individual and co-operative effort. The land suitable for cultivation was divided into infield and outfield, as the Norwegians still do. Each man had a concurrent right to the whole farm. Periodically, the shares, known as rigs, long strips, were redistributed by ballot among the holders. The remainder of the farm was used communally under a system of stinted rights. The environment and the land forms restricted the arable areas to the coast and a few internal glens. Hence, the settlements were coastal.

The crops were oats and barley, with some rye and a little flax. The stock was cattle, raised for export as a means of paying the rent and securing a limited number of necessities, and a few sheep which were kept to provide wool for clothing and occasionally meat. There were also horses and goats and, probably, pigs.

The techniques of land use were rudimentary and laborious. Most of the land was prepared with a foot plough. The cumbersome four horse plough was also used on better land. Co-operation was essential for the horse plough and an accessory for the foot plough. The yields were small, and periodically

[82] Henderson, op. cit., pp. 136-137.

there was famine. To supplement the diet, the men fished for 175*
domestic use. There were no specialists. Each man was a subsistence farmer, who bred a few head of cattle to meet his rent and provide dairy products, grew some grain for his family, and fished.

Trade with the Lowlands was established by the chief and his tacksmen. The droving industry, the overland marches of cattle from the Island to the market centers, provided the chief's only source of income, from which he paid the taxes assessed by the Crown and provided the clansmen with meal in bad years. There was also a less well organized trade in minor local produce and imports carried on with the Lowlands.

The Religion of the Clansmen

175* 771 784 795

Very little is known about the religious aspect of the culture during the days of the clan beyond the knowledge that the people passed through several changes in common with the rest of Scotland.[83] During the years of Norse occupation they worshipped under a tribal religion known as the Culdees Church, a secular order with a married priesthood and hereditary abbots. By the time Skye had become a part of Scotland, and the old Culdees Church had been replaced by Roman Catholicism.[84] In

[83] Cf., e.g., Lauchlan M. Watt, "Religion in the Clachan," in Home Life of the Highlanders, pp. 52-60.

[84] Origines Parochiales Scotiae (2 vols.; Edinburgh: W.H. Lizars, 1854), Vol. II, part I, pp. 340, 343-344, 354, 357.

oth the Highlands and the Lowlands politics and religion 175* 771 794 795
ecame completely intertwined. In the latter half of the
ingdom it began as a support for the crown and a force for
eaceful and orderly government, but the church became the
rey of self-seeking prelates.[85] On Skye hardly anything was
nown of the abuses of the Roman Church. There was no scope
or two ruling powers in the small communities. The priests,
aithful to their heritage and loyal to chief and clan, minis-
ered to the clansmen while their contemporaries elsewhere in
urope were guilty of neglect and corruptness. Nevertheless,
he Reformation, 1560, gradually influenced the Sgiathanach.
here was an important difference between the acceptance of
he reformed kirk in the Lowlands and on Skye. In the Lowlands
resbyterianism, in particular its emphasis on individualism,
ited the needs and aspirations of the people, and they welcomed
form. In the Highlands the Catholic faith was extinguished
a lack of priests.[86] Although the old faith was regarded
an amalgam of paganism, a cult of the saints, and meaningless
rmalism, practically all the reformed kirk could do, in the
ce of strong opposition, was to expel the priests, or make
re that no new priests found entry.

While the Scots were prepared to fight the Stuart king of
otland and England in 1638 and on several other occasions,
lminating in the Glorious Revolution in 1688, for their

[85] Notestein, op. cit., pp. 103-114.

[86] Peter Anson, The Catholic Church in Modern Scotland
ondon: Oates and Washbourne, 1937), pp. 35-44.

spiritual independence, the Skyemen stood stoutly behind their 175* 771 794 795
devine right kings who tried to modify the church in the
direction of Anglicanism. It was not until after Presbyterianism
had been replaced by Episcopacy that the Reformation reached
Skye, and it was not until after the Glorious Revolution that
communion was celebrated in the Presbyterian form.[87] Even so,
it required using the well worn trick of inviting the clan
chiefs to dinner on board ship and then arresting them to make
them agree to support the clergy and the discipline of the
reformed kirk.[88] As late as 1700 the people had not shown any
of the religious fervor which had ripped the Lowlands asunder.
The Sgiathanach, although nominally converted from Catholicism,
was apathetic to the slight differences between Episcopacy
and Presbyterianism. Revolution and Restoration made little
difference. The ministers, who were hereditary, remained, and
were succeeded by their sons.[89] Catholic and pagan rituals
persisted. At the close of the seventeenth century, Christmas,
Good Friday, Easter, and St. Michael's Day were still observed.[90]
They had been dropped from the Scots' calendar more than a
hundred years before. The holy wells were still believed

efficacious. Amulets were still worn as charms.

Even more important, religion was still intertwined 175* 771 794 795
with the structure of the clan. The ministers were said to be
negligent, either afraid of or sympathetic with local sentiments,
in their duty, by the evangelicals who waged an uncompromising
hostility to the old folk culture which tied the people to the
past.[91] It could hardly have been otherwise. The ministers
were tacksmen; they were married to daughters of tacksmen,
and their children married into tacksmen's families.[92] The
chief or a cadet of the clan met with the minister and his elders,
the lay kirk officers who were probably tacksmen, when a kirk
session was held, and the chief enforced their decisions by
his "irresistible authority."[93] Thus, the influence of clan
brotherhood pervaded every aspect of the culture. There still
was no room for two independent leaders. The people could not
have lost toleration for differing faiths. Episcopal, Catholic,
and Presbyterian families lived together without rupture. Re-
ligious fervor could have broken the clan. To see how the old
and the new blended, let us turn to the life cycle.

Life Cycle

Birth. Childbirth placed both the mother and child in the 175
danger of harm by malevolent spirits, especially fairies, who 8
would substitute one of their children for the human child.[94]
To protect them each morning and evening a sunwise circle was
made around the mother and child with a firebrand or burning
peat. All visitors crossed themselves with a firebrand and
might have the circle of fire made around them. As a token
of good luck the child was given silver; it was bad luck to
give it to the mother. If a person praised the child without
wishing it good luck or God's blessing, they might put the evil
eye on it. Although only old midwives are said to have continu
to make the firey circle by 1700 on Skye, the belief in the
evil eye was still strong.[95] The mother did no work, and
rejoicing was postponed until she was "kirked." The parents,
their relatives and friends attended a church service to give
thanks for a safe mother and a living child. After the service
they went to the home for a feast and dance. Following the
Reformation, the custom was placed under censure, as were all
Catholic and pagan rituals.

Baptism. Baptism freed the child from the power of the fairies
and the evil eye. Until baptized, the child was not called by
any name. On the way to baptism, the parents carried bread and

hteen to twenty pennies equalling an ounce of silver, the d valuation on Skye was based on the number of cattle which a n could support.[65] All other stock and the amount of tivatable land was disregarded, being considered as essary to the support of the tenants. Wealth was measured the number of cattle an individual possessed; quality was econdary consideration. The number placed on the land, refore, was regulated by how many could be carried over the t favorable part of the year. As a natural consequence, hief agricultural defect was overstocking.

The tacksmen left their cattle and horses on the hill year round. No attempt was made to separate the beef dairy cattle, and, except for milch cows, which were given e straw, boiled chaff, and, in late winter, a few sheaths oats, the cattle were not fed. Many had to be lifted to ir feet in the spring. The process of gladden, of course, troyed much of the straw which could have provided winter d for the cattle. It was not until 1735 that any hay was wn on the island; it was used to feed the stirks (young tle). The small tenant and subtenant shared his house, and oats, with his cow. Distemper and malnutrition was common. a cow calved before the beginning of March, it was four or e weeks before she had enough milk for the calf, and the ld from the best cows was small.

Sheep were housed at night to protect them from the foxes. ring the winter they received about the same care as milch

coxs. In the spring they were turned loose on the moors. For identification their owner either cut their ears or burned their horns with a hot iron.

As soon as possible after the spring sowing, the stock was moved to the rough grazing lands. Although there is no evidence to suggest that the sheiling (from the Norse skaling) life formed a part of the annual routine, its later importance makes it plausible. Rude huts of stone or timber were erected in the higher mountain pastures to which the cattle were driven by the people of each farm. In the sheilings the women cared for the stock and spent their time making dairy produce. For the young men and women it was a time for courting. The able bodied men must have taken only a limited part in the sheiling life; they were kept occupied with other duties.

The Droving Trade. The chief industry of the Skye was the cattle trade with mainland Scotland and, after the Union of 1707, England. As early as 1502, "marts," surplus cattle sold off in the autumn, were being exported from the barony of Trotternish.[66] By the middle of the century, the Highland trade had grown to such proportions that the Privy Council was forced to enact measures for the preservation of order at the markets. At the close of the sixteenth century, a MacDonald chief had established a regular trade in cattle and ponies between the Outer Isles, Skye, and the east coast of Scotland. By the time of the Union, Skye had become the largest producer of

[66] For details on the droving trade, see A. R. B. Haldane, The Drove Roads of Scotland (Edinburgh: Thomas Nelson and Sons, 1952), pp. 2-35, 68-83.

#175 cattle in Scotland and served as the gathering place for most
439 of the Outer Hebridean stock.

The history of the cattle trade reflects the prevailing conditions of the times. Since cattle were the main form of movable property, they were the favorite prey in inter-clan raids. Indeed, until about 1640, the acceptance of a chief was dependent on his success as a cattle thief. Almost all clan wars began with a creach, a cattle raid. Some of these cattle lifting expeditions kept the men of Skye scuttling back and forth over the island and the neighboring mainland for years. Until the fifteenth century, the trade was primarily based on illegal droving. As late as the seventeenth century, a substantial proportion of the stock brought to market was stolen. The Privy Council, fully aware of the fact that the export of cattle and horses provided the only means by which the islanders could pay the king's duties, continuously strove to restrain illegal trade.[67] They enjoyed meager success. At best they could only name the guilty party and pass a sentence of outlawry while the offender was safe at home. The most stringent enactment was passed in 1609. It sought to compel drovers and merchants to buy only from those answerable to the King's laws. Skye was not included among the obedient subjects. It was only after the Union that droving became a lawful, organized trade with established markets.

[67] "State of the Highlands at the Beginning of the Seventeenth Century," in Burt, op. cit., Vol. II, Appendix 1, p. 252.

*175 439 A variety of factors operated to enable Skye to become the primary Highland beef producer.[68] The emphasis on horticulture in the Lowlands and sheep breeding in the Southern Uplands, restricted the raising of cattle. The climate and terrain made the island more suitable for pasture than crop cultivation. The island had been geographically isolated from the ravages of the wars between England and Scotland, which periodically devasted the Lowlands and eastern Highlands, from the thirteenth through the sixteenth centuries, and from the internal troubles of the nation in which the clansmen played no small part. The determined resistance to the encroachment of the Crown fortified this isolation. Only rarely did the King's forces penetrate, and when they did, the islanders temporarily submitted. The clan wars had a way of balancing one another. Economic conditions also played their role. The tendency toward overstocking, coupled with the primitive methods of cultivation, compelled the tacksmen to thin their herds each autumn. The small amount of land allowed to each clansman would not support more than one or two cows. Stirks had to be disposed of and went to the tacksmen or the chief as rent and, perhaps, as payment for the purchase of necessities.

Transportation provided no difficulties. Boats had to be used to bring the cattle from the Outer Isles to Skye, but in trade from Skye the cattle provided their own transportation. Two fairs a year were held at Portree, beginning in 1693, in

[68] Cf., e.g., Haldane, op. cit., pp. 68-69.

mid-June and early September.[69] The horses and cattle sold at the fair were moved across Skye to either Kyle Akin or Kyle Rhea. When the tide was fairly low, the stock were ferried across, five head at a time. They were simply tied head to tail and pulled behind a boat. Once ashore, the cattle were driven south over the drove roads. The actual driving of the herd was entrusted to the clansmen, but it was the chiefs and tacksmen, who received the cattle in rent, who organized the trade and conducted the sales. Later, as banking houses were founded, professional drovers began to come to Skye. They usually bought on commission, bartering their knowledge of the country for a profit. Some of these drovers replaced the tacksmen and chiefs, paying them for the right to buy from the clansmen.

Markets and Trade. In addition to the droving trade, there was a limited amount of trade between Skye and the mainland in local products and a few necessities. As early as 1630 the yield of oats and barley was sufficient to enable Skye to export some grain to the mainland.[70] This export continued at the end of the century.[71] Probably the area producing the surplus was the barony of Trotternish. It was not, however, always a favorable balance. In 1726, for example, MacLeod had

[71] Martin, op. cit., p. 197

o import grain to feed his clansmen.[72] Other local exports ncluded wool, hides, tallow, furs, goats, sheep, butter, cheese, nd "Skye Champagne" (whiskey).[73] How the trade was carried on s uncertain. In 1630 it was said that the inhabitants traded ith Glasgow, but a navigator's handbook written in 1599 asserts hat the lack of trade with the Hebrides was due to the ignorance f most navigators about the seas.[74] By 1695, all the previsly mentioned products were being sold or bartered at the emi-annual fair at Portree.[75] No doubt the drovers were bringing n various mainland goods. There were also some peddlers from orayshire who had settled on Skye and travelled through the slands.[76] In 1750 a government officer who visited the island ained that until 1700 the people had ferried their exports ross to the mainland at Glenelg and then went by horse to verness where they obtained their merchant goods for the ar.[77] Trade by sea with Glasgow was said to be relatively cent.

shing. In terms of subsistence, fish were more important to e Skye folk than their stock.[78] The seas, lochs and rivers

provided a plentiful supply of numerous varieties of fish, including herring, cod, ling, mackerel, salmon, trout, oysters, mussels, whelks, cockles, and limpets. Lobsters were also plentiful, but they were not taken from the sea. Herring was the most important of all. It alone was taken in nets. During the summer, fresh herring was important in the diet. Beginning in September, the people preserved and dried the herring without salt, which was almost impossible to obtain because of the high tariff and the lack of custom houses. The fish were simply gutted and hung in pairs on a heather rope strung across the house. The peat smoke was no doubt a factor in their keeping all winter. Shell fish were gathered along the shore by the women. In addition to being of some importance in the diet, shell fish were used to cure many forms of sickness. All other fish was taken by anglers, using raw fish for bait. Most fish was eaten fresh. The cuddy provided oil for the lamps. Generally, fishing was restricted to the summer months.

Commercially, the seas were not exploited by the local inhabitants.[79] Indeed, the fishing industry was late in developing all over Scotland. The political unrest of the times and the general economic depression of Scotland tended to suppress the industry until the seventeenth century. However, some enterprising fish curers from the royal burghs and many foreign fishermen found the Hebridean seas profitable, especially from the sixteenth century on. The clansmen profited from the

*175 764 Death. At death a "likewake" was held. All work in the township ceased and the fires were put out. A bowl of salt, to represent the soul, and a bowl of earth, to represent the body, were placed on the chest of the deceased. The room was filled day and night with relatives and friends who jested, sang, spun yarns, fiddled, piped and danced. A bard was present to recite praises for the deceased. The Reformed Kirk tried to stop these irregularities, which were regarded as heathen superstitions, by limiting the guests to near relatives and prescribing sober behavior and the reading of scripture.[100] The result was that for many years religion was absent at funerals. One Englishman found a Highland funeral merrier than an English wedding.[101] Ministers or elders do not seem to have attended funerals anywhere in the Highlands, until around 1700 when "chesting," placing the body in the coffin after being wrapped in a linen sheet or, later, a woolen cloth, under the supervision of a minister or elder became a legal requirement.[102]

Burial was usually on the Sabbath, until 1650. The party, including women who followed wailing to the grave, was well provided with food and whiskey. Fights, resulting in serious injury, were common and not infrequently the coffin was misplaced on the way. Up to about 1700 small cairns (small heaps of stones) were erected at each halting place.[103] The graveyard, or the church when they buried in the church, was approached from the east.

Conclusion

*175 We have, then, a picture of a simple, isolated, kinship-oriented culture. The focus was provided by the clan, an all pervading belief in brotherhood. The essence of the clan system was the common tie of territory and kinship. The chief was the living representative of the common ancestor. The cadets and tacksmen secured his position and maintained the belief in common descent by bridging the cleavage between him and the dependent followers. All authority stemmed from the status of a patriarch, the head of a king group, family, derbfine, or clan. Moreover, in the structure of the clan we find a strong feeling for a hierarchy. Still, at the bottom, the system was equalitarian. It rested on mutual, reciprocal devotion.

Commercialism was not well developed. The land had little or no value as a source of revenue. Nor was it only the means of subsistence. For the chief, who gave the clan coherence and endurance, its value was in supporting as many followers as possible under the undeveloped techniques of land use. For the people it was the ancestral home. Every man had a share in the soil. There were no opportunities to achieve status. Under the communal system there was no incentive to be anything other than a self-sufficient pastoral agriculturalist. There was but little trade, and there were no towns.

Religiously, the Sgiathanach had a simple faith. He was unconcerned with constitutional differences. In fact, his religion was an amalgam of pagan, Catholic, and Presbyterian

butter. If the child was a boy, they gave some to the first man they met; if a girl, to the first woman. The Reformed Kirk continued the practice of public baptism before the congregation. The father, or godfather, continued to recite the Apostle's Creed. The Lord's Prayer was said, and a doxology was sung. When an attempt was made to abolish set prayers and liturgy sometime around 1650, baptism ceased to be performed in church. Following baptism, the festivities of the kirking were repeated. Private baptism was not forbidden until 1690. 175* 852

Marriage. Marriage, either regular or irregular, for a lifetime or a year, was a contract. The young clansman with his father and friends went to the girl's home where the oldest in the group told who was wanted. If her parents thought the marriage desirable, the party was invited in to eat and drink. This was the "little agreement." In about two weeks the "great contract," the settlement of the dowry and date of the wedding was concluded at a dance and feast. Among the gentry a great deal of money passed in marriage contracts. Both dowries and tochers, a form of dower, were settled. The dowry varied with the status of the woman; the tocher with the position of the man.[96] 175* 58

The "booking" may have occured on Skye. Elsewhere, at least, shortly before the fixed date the couple bound themselves, under penalty of a money fine, to marry by the date. The money was placed in the hands of a neutral party, usually the session clerk who entered their intentions in his books. In view of the

---

[96] Lachlan MacDonald, op. cit., pp. 68-69.

resistance of the Skye ministers to parish registers,[97] however, the "booking" is dubious. 175 58

About a week before the wedding, the young couple went out together to invite their guests. All who came brought food and drink for the feast. Before the marriage the groom's party assembled at his home and the bride's at hers. The marriage took place in the church, at least after 1690, and was followed by festivities at her home which lasted until the refreshments were gone, three days was the minimum. On the morning after marriage, the bride's mother bound her daughter's hair in a linen coif before rising.[98] Her friends then dressed her. The couple was toasted with whiskey while they sat in bed. Marriage took place on Thursday and the party had to last until after the kirking on Sunday. The Kirk censured the Sabbath celebration, especially the piping, promiscuous dancing, and drunkenness.[99]

At the end of the rejoicing, the couple was conveyed to their new home by the party. As they entered, the eldest man broke a bannock over the bride's head; all tried to get a piece of the lucky bannock. The first man the bride met on the path had to address her in verse, the poet's blessing. Her father, perhaps in return for the food and drink sent by the chief, presented the chief with a horse or cow. No one was allowed to marry without showing the chief he was able to support a wife.

#175 practice. His spiritual leaders were his counselors in secular affairs, the tacksmen. Religious fervor could have broken the clan, but it remained a support for the structure of the society. The Reformation influenced the clansmen only in so far as the patriarch would let it.

Two hundred years ago the culture of the Sgiathanach was distinctive. We are now in a position to ask how has the culture changed and to what extent has it preserved its continuity?

It is only in the distant past and comparatively recent times that governmental inquiries and enactments give a glimpse into the culture. For well over a hundred years after the abolition of the clan system the British government showed a lack of interest in the culture involved in the local situation. While the American colonists rebelled because taxation without representation was no less than tyranny, the Islanders suffered in silence under the law of the Kingdom. Two works, however, give a picture of life on Skye. These are the Land Statistical Account of Scotland and the New Statistical Account of Scotland.[1]

The conceptual scheme which has been adopted to reduce material history to culture history takes two points of departure.[2] On the one hand, there are four well defined periods marked by innovations in the economic, social, and religious aspects of the culture and varying rates of population change. On the other hand, there are the overall trends of change in the and population change and the continuity of the culture. The dates selected to mark the beginning of each period are: 1745, 1811, 1847, and 1886. The year 1745 is the conventional date for the beginning of the modern period of Highland history. It also marks the beginning of a prolonged period of population

[1]The Statistical Account of Scotland, ed. Sir John Sinclair (Edinburgh: William Creech, 1791-1799) and The New Statistical Account of Scotland (Edinburgh: William Blackwood and Sons, 1845). I shall refer to these works as OSA and NSA.

[2]I am indebted to Julian Steward for the general approach which follows.

growth. In 1811 the first alterations in the traditional system of land use were made. A religious revival was underway. The former social hierarchy had almost disappeared, and population growth accelerated. The year 1847 witnessed a cultural upheaval and a reorientation of the culture. The state church had been broken by schism. Famine was widespread. Large scale commercial farming was replacing the subsistence economy, and the population began to decline. In 1886 the government passed the Crofters Act, a significantly decisive date for the Highlands since the beginning of the modern period. Commercial farming was restricted in favor of the traditional economy. Within a few years religious schism again appeared. Population decline accelerated and the age structure began to be modified in the direction of an aging population.

Period I (1745 - 1811)

The failure of the "Forty-Five" is popularly regarded as marking the end of the clan system. Political and economic unity and the heralding of the beginning of the modern period of Highland history. In reality, the break with the past was not as sudden or complete as is commonly thought. The clan organization had undergone profound modification and functionally was in a state of decay before the abortive rebellion. Parliament the British government to administer the coup de grace. The event was only the catalyst which hastened the political and economic assimilation of the region with the lowlands of Scotland. In retrospect, the reforms and innovations which

followed the social organization, economic system and pattern of religious life formerly characteristic of the Isle of Skye can in many cases be traced well back of the "Forty-Five." The crucial fact is that only after this date did they assume importance. Moreover, many traits which typified the culture in the days when a belief in clan brotherhood was an all pervading regulator of human relationships persisted with varying intensity and duration, and the form of the culture was modified.

The British government was determined to shatter the remaining feelings of clan sentiment, which were regarded as synonymous with hostility to peace and to settled habits of industry. The clansmen, rebels and Jacobite allies, were disarmed and forbidden to wear their distinctive dress. Hereditary jurisdictions were abolished. Sheriffs and sheriff-substitutes replaced the local barons' courts. The disaffected chiefs were deprived of their estates. In short, the political and military power of the clan chiefs was broken. The English believed they had emancipated an enslaved and poverty-stricken people from the yoke of arbitrary and tyrannical power.[3]

Where the clansmen were not restricted and protected by his chief and tacksman there was a void. The system of justice for the island was placed under a single sheriff-substitute.[4] Beyond his presence, the influence of the British Government

felt only when and was were enlisted into the armed forces, or when flagrant enormities were enforced.[5] For in times any indication that the people were inclined to look to the government for assistance. Social control was strong enough to deal with transgressors. In Dalriadan parlia, for example, the minister reported that "no fewer than thirty persons have been expelled for theft, not by sentence of the magistrate, but by the united efforts of the better sort of inhabitants."[6]

The effects of the changes did not in themselves have any effect on the day to day life of the people. Be sure, they turn to the attitudes and policies of the former clan chiefs to find the sources for cultural change. Deprived of their feudal prerogatives and, in consequence, some of their dignity and influence, the chief was transformed into a landlord. Hereditary jurisdictions were abolished. Sheriffs and sheriff-substitutes replaced the local barons' courts. The disaffected chiefs were deprived of their estates. In short, the political and military power of the clan chiefs was broken. The English believed they had emancipated an enslaved and poverty-stricken people from the yoke of arbitrary and tyrannical power.[7]

Where the clansmen were not restricted and protected by his chief and tacksman there was a void. The system of justice for the island was placed under a single sheriff-substitute.[8] Beyond his presence, the influence of the British Government

felt only when and was were enlisted into the armed forces, or when flagrant enormities were enforced.[9] For in times any indication that the people were inclined to look to the government for assistance. Social control was strong enough to deal with transgressors. In Dalriadan parlia, for example, the minister reported that "no fewer than thirty persons have been expelled for theft, not by sentence of the magistrate, but by the united efforts of the better sort of inhabitants."[10]

While the processes of commercialization involved now more than the conversion of all resources into money, it been in the cattle market, stimulated by economic developments in the lowlands, made the commercialization relatively simple. The landlords merely turned to rackrenting.[11]

The atrophy of the affection which had characterized the relationship of chief and tacksman was exposed. When the latter were offered new leases, at rents which made the former rents seem only nominal, they once again rallied together for a common cause.[12] Only this time they used the technique of sit-down strike to the demands of a landlord rather than to the support of a chief. Many of the tacksmen emigrated, some taking their subtenants with them. There was another reason for the gradual disappearance of the tacksman. The time had passed when the senior member of the central derbfine, the four generation family, had no other way to provide for his blood and collateral relations than by giving them a farm. They could now achieve their ambitions by means of a commercial career.[13] By the end of this period, the men who had supported the structure of the society, by bridging the cleavage between the chief and the clansmen and by reinforcing the belief in kinship, were to be found in the four corners of the world.

dynamic evangelical form of worship in preference to the moderate, humanistic preaching of their own ministers.

Period II (1811-1847)

The year 1811 marks a turning point in the culture history of the Isle of Skye. During the second period the processes we have observed in the initial period gained strength and began to unfold in their characteristic forms. By this time the Industrial Revolution was nearly 100 years old. Britain was on the verge of victory in her wars for the freedom of the seas and her commercial empire was her major concern. Since the government remained disinterested in the Highlands, the sources for culture change must again be sought in the attitudes and policies of the local landlords.

Exercising their legal powers to separate and reunite the interested strips of arable into permanent, compact holdings, the landlords carried out the enclosure of the commons between 1811 and 1819 (ruanig was virtually abolished.[1] In the Lowlands and Eastern Highlands this alteration of the traditional system of land use was not, at least, the first step in the direction of a more sweeping reform, consolidation of

121

The land into large commercial farms.[26] Even had the landlords desired to emulate the results achieved elsewhere, it is doubtful that the persistent demands of the steadily increasing numbers of people for a share in the land could have been disregarded at this time. On Skye, as in most of the Western Highlands, the crofts of the old farms was simply divided into as many equal shares of five to ten acres as possible. The grazing lands continued to be held in common and used under a system of strict rules and regulations, and the arable was commonly between harvesting and spring ploughing. Lacking any legally recognized traditional or written right to the land, the people remained tenants at will, enjoying hereditary tenure as long as they had the good will of the landlord and, especially, that of his factor.

The people, then, were each given a precisely equal share, which was often assigned to them in lots, in the old farms. Just as the old infield and outfield system had functioned to provide each man with a bit of the worst and a bit of the best soil, the shares were set out in long strips. After the former joint-tenants and subtenants received their final allotments, they moved their dwellings from the small hamlet-like clusters near the center of each farm to the individual plots. The township settlement patterns, as we now know it, came into existence.

The effects of this rather superficial reorganization

122

soon become apparent. There was a leveling of the social hierarchy. The former joint-tenants, subtenants, and cotters had become crofters. Whatever relationships had existed between the master the clansmen, all were now more or less equal in status. The cotters seem to have temporarily disappeared.[27] The proprietors were absent, and the tacksmen were almost gone. Indeed, the indignant withdrawal of the tacksmen had contributed to the circumstances which made the abolition of runrig possible.

Although the crofts were small and the rents were high, the people were able to satisfy much of their domestic needs by combining cultivation, stock breeding, and fishing. They could also make enough from the droving trade and, in certain areas, helping to pay the rents and purchase grain. The crofts were considered more than adequate. Early marriage and subdivision of the crofts became common practice.[28] When a crofter's son married, he was allowed to take part of his father's land and build a house. The proprietors may have explicitly encouraged the practice of early marriage and subdivision. Those who could be gently prodded into helping or commercial fishing not only produced a valuable export but also paid for the privilege of working in the form of high rents. Within a generation three and four minister families were living on crofts originally intended for one. When subdivision was at last forbidden, about 1840, the crofter simply took his

123

married sons into the house. Family solidarity was strengthened. As each cottar came to be the home of a three generation family, the crofters, whatever problems they had with each other, were the clansmen, all were now more or less equal in status. The cotters seem to have temporarily disappeared.[27] The proprietors were absent, and the tacksmen were almost gone. Indeed, the indignant withdrawal of the tacksmen had contributed to the circumstances which made the abolition of runrig possible.

But only were villages completely alien to his heritage but he was also in bad neither the need to purchase commodities nor the opportunity to accumulate a surplus for buying more than a little grain or an occasional necessity. Whatever his small needs, they could be satisfied locally, especially, by turning to a local tacksman or the estate factor, both of whom made gratuities for sundries available on an extended credit-with-barter basis.

Plans were drawn up for the establishment of a village at Portree shortly after the Forty-five.[29] Over fifty years passed before that town could be said of Portree was that it had "the appearance of a village."[30] Another attempt to bring a village to Skye was made in 1797 when a group of skilled Highlanders in London built the abortive fishing villages of Stein.[31] As a part of the reorganization of the Macdonald estates, villages were laid out at Portree and Uyleskin sometime after 1811.[32] Uyleskin failed to develop.

By 1845 there was a small crescent of houses along the shore, a few shops, a post office, a hotel, a church, a school, a pier, and a new inn, a church, a post office, a bank, several stores and a street of homes. The population had grown to 2,000 of 5,000. The existence of the village depended on the summer cattle markets and the fishing industry, which was in the hands of merchants.

Following the establishment of Portree and accompanying the gradual decline in self-sufficiency, the island was brought into closer contact with Great Britain and the extension of regular means of communication.[35] Regular communications, of course, are a prerequisite for commercialization. There must be access to markets for the ideal produce and access to consumer goods. Without such access no man can specialize; with it the Kelebhanach has been disclosed to specialize. The old drove route, the beaten paths which had served them well for many centuries, were now supplanted by roads in the Lowland sense of the term. By the end of the period most of the more accessible townships had been connected with Portree and the mainland, and a steamer had entered regular service between Portree and Glasgow. These factors paved the way for the introduction of commercial sheep farming.

126

While the process of commercialization proceeded against the prevailing forces of the Lowland market, but not against the wil way of life, events in Great Britain were beginning to have a pronounced adverse effect on the local economy. The end of the Napoleonic Wars brought the cattle boom to an end. Although the droving trade remained brisk, the value of the stock declined markedly.[37] An increase in the number of cattle on the grazings, as a means to maintain an economic equilibrium, was impossible. The island has already overstocked and had been devastated by this practice. At the same time, development of large scale commercial farming in the Lowlands had encroached on the right of way of the drovers, and the Skye cattle were suffering at the markets from competition with improved, better nourished breeds from the northeast and southwest. The end of the wars also witnessed a decline in the kelp market. Parliament finally completely abolished kelping by means of bounties, thus supplanting the kelp industry.

The crofters, who had suffered backbreaking to get their [illegible] small strips of arable, found themselves without the means to pay the rents which had been set at the peak of the cattle and kelp markets and without enough land to meet subsistence needs.[38] The striking thing is that in spite of increasing economic hardship, the population continued to grow. They became hostages

127

to the health of the potato and their one fertility.[40] Many people were forced to work for fishing, on a part time basis, but even the initial success was short-lived. Others supplemented their diminishing incomes from the croft by seasonal employment in the Lowlands. Crofting had ceased to be a subsistence economy; the people had lost their self-sufficiency. But were they ever quite able to escape from a dependence on some form of supplementary income to provide the bare essentials of life. The difference between conditions then and now is that the pressure of the population on the means of subsistence increased until it approached a Malthusian ceiling.

In the intrinsic epidemic and famine began to take their [illegible] toll. Institutions became widespread and there was no system of relief beyond the moral obligation of the proprietors to provide grain. The marriage rate fell. In Kilmuir the average annual number of marriages fell from twenty-five to six. Subdivision was forbidden, but it was too late. In the parish of Kilmuir there were 190 lots, crofts, and farms to support [illegible] 425 families in 1840. In all of Skye, after the emigration of [illegible] at least 12,000 people, there were 3000 crofters and 3,000 cottars.[41] Despite the fact that land had become as big a luxury as meat and the fact that many were living on potatoes and fish, the population continued to increase. By 1841 it reached 23,076. Finally, the economic structure collapsed.

In the autumn of 1846 there were no potatoes. A blight [illegible] destroyed the entire crop. Although the famine was universal [illegible]

[40] For details concerning the plight of the crofters at this time, see Ibid., pp. 218-220.

128

In Scotland, it lasted the same efforts elsewhere. There is a [illegible] significant correlation in the Highlands and Islands, as in Ireland, of the dependence of the population on the means of subsistence, due to a change from subsistence farming to a partially commercial system of land use, and the intensity of the crop failure. In both countries the persistence of innumerable [illegible] levels from the traditional economy, including conservative techniques, attachment to the land, and a tendency to share the land among the kin, hampered commercialization or, at least, specialization and gave rise to devastation.

Five years of famine ended the period of crofting. [illegible] The emigration of large numbers and the death of untold numbers[42] must have seriously disturbed the patterns of interaction within the extended family and the township. Although the proprietors made a final effort to help their tenants, ruining themselves financially, they had foreseen their people. The [illegible] ministers were so shocked by the famine that they began to [illegible] the symbols and values they upheld reflected the attitudes of the landlords and lessed significance for the people.

A religious revival resulted effective proportions by [illegible] 1852.[43] The appearance of the Revival suggests that the Kirk was far more disorganized than the scant social and economic record indicates. Normally, the attempt to seek supernatural assistance as a source of comfort and hope appears only after the efforts have become thoroughly disorganized.[44]

appear in the parishes of Bracadale and Duirnet. Bracadale had already seen the beginnings of the final stage in commercialization; Duirnet had been sold piecemeal to new landlords.

Evangelical Presbyterianism created a new pattern of ritual and religious life on Skye. It gave the Gaelic a new forum to replace the dead clan system. Much of the form of religious worship and behavior characteristic of the Island today was established during this Revival Movement. The "Men" became the leaders of the Kirk and of the community. An esoteric religious hierarchy evolved. There were the unfortunate few who were in a state of saving grace and acceptable at Communion, and the eminent "Men," who had age, venerable spiritual lairds.[46]

The Revival, unlike many nativistic movements, neither held out the promise of cultural regeneration nor offered the means of protest against the economic conditions. Instead, it fuse the traditional characteristic of the late seventeenth and early eighteenth-centuries was renewed with vigor. While religious enthusiasm grew, social life became a family level was restricted. Perhaps, it was of destitution and the ever present threat of famine had made hospitality a luxury which few could afford. Perhaps, it was no longer possible for the people to provide whisky and food for large numbers at a Communion. The local ministers assert that the changes were due to the activities of the "Men." It would seem that the "Men" were

[46] Hutchinson, op. cit., p. 211.

agents for what have been called "rites of intensification."[49] They restored the equilibrium of interaction by creating new behavior patterns. This was probably particularly true during the famine, when the people's relatives and friends were dying and emigrating in large numbers. While the ceilidh, an evening of spinning folk tales, singing, and dancing, was condemned, and the children of parents who would not conform to the dictates of one minister and the "Men" were refused baptism, prayer meetings and other church services were providing emotional outlets.[50]

175* 178* 182 786 797 793 775 771 [798]

Like the Welsh,[51] the Skye crofters found the Bible retold much of their own past history and their present difficulties. As the "Men" preached from Scripture and interpreted the meaning, often using allegorical interpretations, of the Word, the people became familiar with a story which was strikingly similar to their own. The present social and economic conditions were but a presage of the coming dissolution. It was all there in the Old Testament, in the books of Judges, Kings, Chronicles, Psalms, and Prophets. The omen was all the more vivid because the transgressors in the Bible lived a life much like the crofters. Both the ancient peoples and the Skyemen had a pastoral economy, a patrilineal family structure,

lien to their heritage. There was little local need for 175* 178* 621
oads and steamships, but they were paving the way for the
inal stage in commercialization, the conversion of the island
nto sheep farms.

The record suggests that the culture was suffering from 175* 178* 182 786
isorganization and the society had been threatened by dis-
ntegration. The Revival, which began at the close of the
nitial period, became full blown. This movement confirms
hat the record suggests. A new pattern of social behavior
nd religious life came into being. The traditional secular
atterns of interaction were being replaced by patterns of
acred interaction. New values, new statuses, and new roles
ere evolving to give religious sanction to the old patterns.
he result was an esoteric religious hierarchy. The religious [797] [793]
eaders, both the "Men" and the ministers, were coming from
he people rather than the old hereditary families who had
een closely related to the gentry. Religion replaced the 175* 178* 182 771 786
lan as the focus for the culture. The similarity of the story
nfolded in the Bible and the past and present conditions of
he crofters made the presage of the coming dissolution vivid.
y the end of the period, dissension within the Church had [798]
ecome a significant factor and was paving the way for individual
ecession. The third period of the modern era was to witness
ore than a social and economic transformation; there was to
e religious schism.

means to acquire capital because he worked on very narrow margins nor the ability to specialize because his communal system forced him to conform to traditional techniques.

The trend to sheep farming, developing from as early as 1810, led to a sweeping disregard for the customary rights of the Skyemen. The factors (estate managers) of the absentee landed gentry, the new landlords, and the graziers had no associations with the tenantry and no use for their labor. Thinking only in commercial terms, they were only interested in seeing the higher grazings, the crofters' shielings, under sheep flocks in summer and the lower pastures, including the crofters' arable, in use during the winter. Thus, the "Clearances" took two directions.[55] The majority of the people seem to have lost their common grazings. In Kilmuir, according to several informants, they were left with only one small area of hill. Glendale suffered from the same policy. Many of the tenants were removed from their townships, by force or persuasion. To be exact, no fewer than sixty-two townships were cleared by the end of this period.[56] The evicted crofters were left to their own devises to reclaim a piece of the open moor, settled in existing townships, or banished from the island. In the area immediately to the north of Portree, forty crofters and

See also Lachlan MacDonald, The Past and Present Position of the Skye Crofters, sheets 9-11, 21-22.

Period IV (1886 - 1953)

*175 *178 648 The year 1886 is a chronological hinge in the culture history of the Sgiathanach. The British government began to play a positive, continuing role in local affairs for the first time in history. Hitherto, the interest of the government had been confined to proscriptions, recruiting, and taxation, occasionally interspersed with relief for the destitute. With the change in policy, we enter the realm of the contemporary culture; therefore, all I wish to do is indicate the direction the processes, which we have been following, took under the national attempt to rechannel them. The major trends to be [42] [182] noted are two. The proprietors' influence in determining how the land was to be used was curtailed, and, with a redirection of the commercialization of the estates, many of the traits and complexes characteristic of the traditional culture assumed renewed importance.

*175 *178 657 423 671 621 632 Since the Napier Commission had been mainly concerned with the disregard of the customary rights of the crofters and their inconsiderate treatment by proprietors, the recommendations which were presented to Parliament sought a land reformation within the framework of local custom.[79] Unlike the Continental Commune, a local, self-governing body, the Highland township had never legally existed. Elsewhere in Scotland this communal agricultural unit had been replaced by individual farm occupancy, just as had been happening on Skye. The major proposal was a retrogressive step; the township system should be given legal

[79] Napier Report, pp. 7-15.

*175 *178 657 423 671 621 632 sanction and endowed with privileges and immunities by which self-regulation, stability, expansion, and improvement might be attained. Additional provisions called for the replacement of the repudiated customary usages by national laws of land tenure.

*175 *178 671 241 427 [565] The Crofters' Holdings (Scotland) Act of 1886 embodied many of the Commission's proposals.[80] The crofter became, perhaps, the only class, as a horizontal segment of the population, with a minimal legal definition. He was a pastoral agriculturalist who resided on his holding, the annual rent of which was less than £30, (later raised to £50) in a crofting parish. Such an individual was entitled to a fixed, fair rent, just compensation for improvements made by himself or his predecessors in the same family should he leave his holding, security of tenure, and modified right to bequeath the holding to a member of his family. Except for the statutory conditions that he must not alienate the holding from his family, sublet without consent, or violate the rights of his neighbors or his landlord, including withholding rent and contributing to the deterioration of the land and dwelling, the crofter was given all the privileges of a landowner with few of the responsibilities. A Crofters Commission, with executive functions, was established to carry out the provisions of the act and to assign "available" land to the townships as

[80] I owe a debt of gratitude to innumerable government officials in Portree, Edinburgh, Glasgow, and London for their patience and cooperation in providing me with the necessary information to discuss this final period of the history of Skye. The facts are theirs; the interpretation is my own responsibility

enlargements when the proprietor would not lease it on reasonable terms. Thus, the government began to protect the crofter from potential abuses and to restore the land to the descendants of the clanna, who had, to say the least, manifested a persistent disinclination to accept any other system of land use. A complete reformation, however, was not yet possible.

The crux of the problem of maintaining the crofting population was succinctly stated in 1851 by the chairman of the Highland Destitution Board. The people could not support themselves, at a subsistence level, unless each crofting family were given ten acres of arable land plus pasture. Not only was there not enough land, but without credit facilities, a man could not find local employment until the land began to produce, and, if he sought employment at a distance, he could not work his land to free himself from the necessity of working for a wage. In 1883 it was estimated that a 50 percent reduction in population would not leave enough land to give each family an adequate holding, ten acres of arable and 277 acres of grazing land.[81] How right they were. Today the population is less than half that of 1883, and still very few have what was considered an adequate holding a hundred years ago. Let us see what measures the government took in the attempt to solve this problem.

At first the land reorganization program was thwarted by a lack of available land and by the continued tendency of

[81] Napier Report, pp. 100-101.

the people to overstock. No land could be assigned as an enlargement if it would impair the value of a sheep farm or deer forest. The remainder of the island was already possessed by crofters. Moreover, there was no one to regulate the use of the common grazings. As the Crofters Commission usurped the functions of the landlord, estate management became lax. The township constable had disappeared. The cottars, 36 percent of the population, had been omitted from the provisions of the Crofters Act. Later when the government provided for a grazing committee to draft voluntary regulations for sharing the common grazing and, finally, coerced the crofters to elect a grazing committee, the regulations could not be enforced, except by appealing to the sheriff.

At length another commission of inquiry visited the Highlands to decide how the resettlement program might be extended. Then, in 1897, the Congested Districts Board was created. The Board was given power to purchase land for enlargements and for creating new holdings, to resettle crofters and cottars from congested districts, to foster the development of stock breeding, agriculture, fishing, and home industries, and to improve communications. It was not intended that the government should become a landlord. The crofters, like the Irish small farmers, were supposed to have acquired a desire to own their own land. In 1904 the estates of Glendale, the present twelve townships, and Kilmuir, the whole parish and part of the parish of Snizort, were purchased. On the Kilmuir Estate there were 450 crofts in 35 townships and 10 large farms

by elders, and a heritage which had never admitted 175*
ct, non-rural population centers. These basic cultural 178* 182
s and patterns were given religious sanction. 779 786 797
Year by year throughout this period the following and
nfluence of the "Men" increased. As the ministers were 175* 178*
, especially as the old hereditary families of ministers 182
ly related to the old gentry were replaced by ministers 786 797
the people,[52] the "Men" became influential in the Church 793 798
ers. Now they could not only exhort the people but
judge them, by determining who was worthy of communion
hose children might be baptized. The strength of their
ol, however, did not require holding office. In Duirinish
an old moderate minister remained, Communion had not
celebrated for eleven years in 1840, and there were 200
tized children.[53] Many preferred to walk miles to worship
an evangelical minister rather than put themselves in
by hearing the local moderate minister. Dissension was
ing a significant factor and was paving the way for
nal secession from the Church. As the official Church was
ned, the stage was set for the Disruption, but we shall
that for the following period.

cy. The second period of the modern epoch saw the con- 175* 178*
tion of the trends established in the initial period. 182
rocess of commercialization was carried one step further. 427
ld running system was replaced by the crofting system.

[53] NSA, pp. 354-355.

ch man received a permanent, compact plot of arable in place 175* 178* 427
his former concurrent right to a whole farm. The change, on
surface, seems to have been superficial. The grazings
ained common property and the arable land became common
operty after the harvest. The significant fact is that
mercialization had not yet led to a disregard for the custom-
rights of the small tenant, except in a few isolated areas.

There were other effects of the change in tenure beyond
eveling of the social hierarchy. By giving more people [167]
irect share in the land emigration was stopped. The practice [61]
subdividing the crofts among the children, as they married, [593]
once favored an increase in population and strengthened the
ily of orientation, if not the extended family. At the same
e, it placed a greater dependence on the potato; the people
ame hostages to the health of the potato and their own
tility. In time progressive economic deterioration began. 175* 178*
old subsistence economy had been weakened by subdivision 731
the small plots, increasing dependence on external markets for
fts from the sale of cattle, and wages from helping or a
tle fishing. When the markets broke, destitution and emi-
tion reappeared. Finally, with a failure of the potato, the
nomic structure collapsed. The population trends were
ersed. The people had remained unspecialized in a nation
specialists.

The next stage in the process of commercialization, the 175* 178*
wth of a village and the extension of communications, had 621
tle perceptible effect on the Sgiathanach. Villages were

eighty cottars in four townships were replaced by two shepherds brought in from the mainland.[57]

As the interests of the proprietors and their tacksmen had clashed at an earlier time, those of the landlords and their tenantry were now irreconcilably opposed. The appearance of the latifundia in England has been described as being characterized by absentee landlords, pastoralism, and a decline in the rural population through death and migration.[58] A process which had begun three centuries earlier in England and which had reached the Scottish Borders two centuries earlier had at last become operative on Skye. Let us examine the effects of full scale commercialization on the Skyemen.

The effects are evident. Commercialization and the evictions, which were a necessary counterpart, prompted emigration and confined the people within narrow limits, often, on inferior land.[59] By 1865 it was possible to describe Sleat as a quiet pastoral land, desolate and deserted.[60] The people had been pushed into a few isolated, badly subdivided townships. In Bracadale, the first parish to be fully commercialized, there were once thirty-six runrig farms; in 1832 there were six large grazing farms.[61] The bulk of the population, 922, were

[60]Smith, op. cit., p. 95. [61]Napier Report, p. 15.

squatters without any legal hold on the land. In Duirinish parish, which includes Glendale, only twenty-one families had enough land to meet even subsistence needs.[62] In one Glendale township, Holmisdale, some crofts of four or five acres had as many as fifteen people to support.[63] Part of this extreme congestion was due to the continued practice of subdividing one's croft when a child married. Although the population in 1831 had fallen to 17,680, from 23,084 in 1841, almost every township had two or three times the number of families which had lived in them in 1841.[64]

The loss of the summer shielings and the common grazings meant few could keep sheep.[65] The looms were silent. Since the rent continued to be based on the value of livestock and was wholly or partially paid from the sale of cattle, all oats, which the graziers' sheep did not eat, went to feed the cattle. The mills were all but idle. The people had to buy flour, meal, and bread imported from Glasgow. Almost all were heavily in debt to the local merchants, who seem to have been newcomers with more associations with the graziers than the crofters and cottars. Milk became a precious commodity. Frequently, the old cow had only enough for her calf. Unable to keep horses, the women became beasts of burden. They carried

[62]Ibid., p. 112.

[63]Alexander MacKenzie, op. cit., p. 419-420.

[64]Smith, op. cit., p. 317; Cummings, op. cit., p. 140; and Napier Report, p. 15.

[65]The following is drawn from the evidence presented to the Napier Commission by the crofters and cottars of Skye; see Napier Report, Appendix 1, pp. 1-82.

the dung from the byre, the peats from the moor, and the oats from the fields. When the land had been turned by caschrom, they yoked themselves to a harrow. The crofters, in Kilmuir, as elsewhere, lost the right to the rivers for fish, to the moors for game, and to the coast for sea weed. The land became exhausted from over tillage. They had clung tenaciously to the old methods. Even if they could have obtained credit and could have broken with the ways of their forefathers, the fear of rackrenting would have deterred them.

A degree of preciseness can be given to this general picture by comparing the arable acreage and stocking of Skye in 1810, the year graziers first appeared, and 1870. In 1810, 30,000 acres were listed as arable, either cultivated or susceptible to it; there were 18,000 cattle and 40,000 sheep.[66] By 1870 no more than 8,383 acres were considered as arable; there were only 9,341 cattle, but there were 136,077 sheep. The magnitude of this change can be emphasized by adding the fact that there were less than 14,000 sheep on the Island at the turn of the century.[67]

The end of the shieling life brought an end to the traditional season for courting. Destitution forced a postponement of marriage and an absolute reduction in the number of marriages. As a natural consequence the birth rate declined. In the decade 1861-1870 the birth rate of Skye stood at 26.1 compared with 34.9 for Scotland.

[66]James MacDonald, op. cit., pp. 748, 754.

[67]OSA, II, 553; III, 247; IV, 131; XVI, 148, 225, 537; XVIII, 184.

compared with 34.9 for Scotland. The death rate among Skyemen, however, was 17.4 compared with 22.0 for Scots in general. But Scotland had a net emigration rate of only 3.6 while the Skyemen were leaving at a rate of 16.5. In this decade no fewer than 3,115 left Skye.

By the end of the third period an additional influence of the process of commercialization had become apparent. The social hierarchy was modified in the direction of greater socio-economic differentiation.[68] At the time of the "Forty-five" Skye was inhabited by the families of three clan chiefs, 139 tacksmen, 517 joint-tenants, 1031 subtenants, and 444 servants. There were now 10 landlords. The tacksmen had been replaced by 29 graziers and 12 small farmers. The joint-tenants, subtenants, and servants had become 2043 crofters and 1227 cottars. In the past there may have been one innkeeper, at Portree, and a few millers; now there were 32 innkeepers, millers, and merchants.

The changes which we have been considering could not have left the patterns of interaction undisturbed. Cooperation among the members of the township would have been unnecessary. Since all were affected by prolonged destitution, mutual aid must have been severely curtailed. The extended family was broken by emigration. The nuclear family was seldom intact for more than part of the year. It seems the majority of the able-bodied men were travelling to the east coast each spring to find

[68]Lachlan MacDonald, The Past and Present Position of the Skye Crofters, pp. 4-5, 6-7, 11-12, 14-15; and J. G. Mackay, "Social Life in Skye from Legend and Story," TGSI, Vol. XXIX (1922), pp. 260-290.

employment as hands on fishing vessels. The young women followed these fleets seeking work as gutters and curers in the ports. Some may have made their way to Portree, where a woolen mill had been erected by the Highland Destitution Committee. The population of Portree increased during these years from 510, in 1841, to 893, in 1881, but this can hardly be regarded as a significant trend.

The really striking aspect of this period is the almost complete lack of protest by the Sgiathanach against the violation of his presumptive right to the land. The disappearance of the tacksmen, of course, had left the people without their counselors and leaders in secular affairs, and many of the ministers, especially those who were themselves sheep farmers, counseled submission to the will of God. Then, too, the ethos of the Skyemen would not allow them to ventilate their grievance They despised the Sassanach and felt that "the landlord was bad enough, but the factor was the Devil himself." Still those who knew them well and those who rambled by their cottages wrote unanimously of a people who endured overwhelming suffering in patience and reticence.[69] The betrayal of any weakness, especially before the cursed Sassanach, was a breach of propriet

The Skyeman had not lost his capacity to respond to leadership. Throughout the nineteenth century there had been widespread and growing discontent all over Europe with the

[70]Norman MacLeod, op. cit., p. 136.

existing system of proprietorship. At length, land leagues were formed to give body to the peasants' protest. The movement finally reached Scotland in 1880. By 1883 it had become important on Skye. Significantly, the agents responsible for the Skyemen's agitation were Irishmen.[71] The stimulus for accepting the course of action advocated by these agents was provided by another famine which coincided with the loss of wages from employment on the east coast fishing vessels.[72] The crofters took the law into their own hands. The Kilmuir crofters refused to pay their rent. The Glendale crofters forcibly drove the sheep off their old cattle grazings. Glasgow police and the Royal Marines were dispatched to Skye.[73] Out of this unrest came the appointment of a royal commission of investigation, but their work is our subject for the fourth period. A more pressing problem is what effect did these events have on the religious outlook of the crofter and what influence did religion have on the configuration of the culture.

While the Revival was underway during the first half of the century, the General Assembly of the Church of Scotland was witnessing a renewed battle over the old question of patronage, the right of the proprietor to select the kirk's minister. Finally, in 1843, the Church was broken by schism

[71] Ferguson, op. cit., pp. 41-43, 121-123.

[72] See Collier, op. cit., pp. 51-52; Hance, The Outer Hebrides in Relation to Highland Depopulation, p. 91.

[73] Detailed accounts of the land raids and resistance to the police can be found in Alexander MacKenzie, The Isle of Skye in 1882-1883 (Inverness: A. and J. MacKenzie, 1884, pp. 7-144. See also Cummings, op. cit., pp. 146-147 and William MacKenzie, op. cit., pp. 24-25.

over this and an associated question, the principle of the spiritual independence of the Church from civil authority. Although the Revival might have created or even renewed a belief in the right of a congregation to call their own minister, it is difficult to see how the principle of spiritual non-intrusion, by courts and parliament, could have mattered much to the people. The significance of the Disruption is that it continued the trend toward conservatism established by the Revival and made it an official policy of the Free Church of Scotland. The overwhelming acceptance of the Free Church manifests a strong correlation with the suggested amount of social and cultural disorganization at the close of the second period. It was no accident that the first Free Church congregation should have been in Bracadale, the first parish to be cleared for sheep. It was not by chance that the people of Kilmuir and Glendale, like so many others, turned to this new source of hope. The ministers left the Church in the true tradition of the Covenanters: "in a state of toil and privation, whether within or without the Established Church, and under persecution if need be."[74] The people followed them because of emotional attachments which they had formed with the seceding ministers during the Revival. Only the seceding ministers were successfully restoring group solidarity. Their emotional and dynamic approach was giving the people the means to maintain cultural continuity. The Old Testament, which they were wont to use, was an additional factor. It

[74] Brown, op. cit., p. 1.

told about a people not unlike the crofters, and the prophesies were being fulfilled before the peoples' very eyes. Is it any wonder that thousands gathered on the hillsides to listen to a minister whose dynamic appeals moved them to tears?

As the people turned to the new church and the emotionalism of the large outdoor gatherings, they continued to forsake their old customs and folklore. The songs, except in some cases the waulking songs which provided the tempo for shrinking homespun, and the tales were placed under clerical bann.[75] The ministers and the "Men" insisted on the prerequisite of gravity in all aspects of life for salvation.[76] The communion roles were purged. In Bracadale, for example, there had been 258 communicant members. Following the Disruption there were less than ten.[77] The same pattern was repeated elsewhere on the island.[78]

The religious patterns which had evolved were, nevertheless, reinforcing much of the traditional way of life. The "Men" of Skye had become elders in the Free Church. This status sanctioned their position in the community. Although the age structure of the population had not yet altered

sufficiently to make age controls an irresistible force, the prestige status of the small number of the "elect," those who had experienced a saving change, and, in particular, the elders gave them complete control over all social and religious activity. In a later chapter I shall have more to say about these facts. The important fact which I want to emphasize now is that the religious patterns provided a framework in which the culture could find continuity and through which the society could achieve a reintegration. The abhorrence of pagan-like customs resulted in a change of content, but there were positive results as well. Above all, there was a change in focus for the culture and society. The decadent belief in clan brotherhood was replaced by a sense of belonging to a known religious brotherhood.

Summary. The third period of the modern phase of Skye's culture history saw the culmination of the process of commercialization of the land. All the influences necessary for the conversion of the subsistence economy, albeit a much deteriorated economy, had begun to function. Sheep farming, on a commercial scale, formed the basis for the new economy. Newcomers with the incentive and ability to introduce improved methods of land utilization were replacing the conservative and impoverished crofters and cottars. As the commercial farmers consolidated their holdings, the communal townships were being obliterated. The concept of individual possession of the land was replacing the customary rights of the small tenants, and a clearly defined social hierarchy, based on

wealth, rose above the indigent crofters and cottars.

These changes had a pronounced effect on the culture a the population. Economic hardship and evictions prompted emigration, forced many men and women to seek seasonal work away from home, and led to a reduction in the marriage rate. Crofting which had already become part-time agriculture now was a spare-time pursuit. The Sgiathanach was dependent on money, on the wider economy, for the satisfaction of most of his needs. The croft was providing no more than a few potatoes for the table and some oats for the cattle, the crofter's only export. Still, no landless working force appeared. Portree had grown and there was a woolen mill, but there does not seem to have been any marked movement int the village by the crofters.

While much of what was meaningful to the people was bei lost, the religious Revival continued. The conservatism of "Men" became an official policy of a new church. The emotio approach of the ministers and the "Men," who were now elders in the church, and the emotionalism of the large outdoor meetings functioned to restore the social disequilibrium. Although the extended family, township, and nuclear family suffered from instability, the people found intelligible role within the religious sphere of activity. Their religion was reinforcing their way of life. The abhorrence of much of the old culture was accompanied by a strengthening of many traits which reaffirmed the desirable status values. The culture found a new focus in congregational religion and was able to maintain a continuity while the content changed.

Heavy rackrenting in the past had led to dissatisfaction and arrears in rent, the crofters' weapon against the landlord. The rents were revised and most of the arrears were cancelled. All the farms but one were subdivided to form 79 new holdings in 7 reorganized townships and to make enlargements to the other townships. The Glendale estate received similar treatment, being made over into 147 crofts in 12 townships plus a jointly held club farm. Both estates were sold to the crofters on a fifty year annunity basis. Then came a rude awakening. Within ten years the crofters found ownership to be a dubious privilege especially since it excluded them from the benefits of legislation favoring the small tenant. The Kilmuir crofters were released from the contract, but the government refused to accept the petition of the Glendale people, who still are not pleased with their rather unique position. Private ownership of the land might be said to be as alien to their heritage as village settlements.

Land settlement continued, with the introduction of certain refinements, the most important of which was the power to use compulsion to acquire land for crofting in the national interest. Today over half the Island is owned by the national government and administered by the Department of Agriculture. The tendency in recent years has been to create more adequate holdings. On the Kilmuir estate the number of crofts has been reduced from 530 to 442. The process of resettlement, or de-commercialization, has been carried further on Skye than in any other Highland area.[82] It has also included the only major

*175 migration scheme to be attempted. In 1923 sixty-eight famili
*178 from the Isle of Harris, in the Outer Hebrides, were brought o
65 to Skye and settled in Bracadale. Probably, close to 300 new
671 holdings and in the neighborhood of 200 enlargements have been
427 made since 1897. This clearly reflects the limited space avai
423 ble for crofting at the end of the "Clearances."
166
231
241

*175 In addition to land settlement, the government has conti
*178 to stimulate improvements in stock breeding techniques and to
65 foster more efficient land utilization. Credit facilities,
671 by grant and loan, were offered to enable the crofters to
427 purchase stock, especially sheep, and to build new cottages.
423 Grants and subsidies, in an ever increasing number, have been
231 made available to promote a fuller use of the land. Initiall
241 under the Congested Districts Board, these facilities were
devised specifically for the Highlands. By the time the Cong
Districts Board was abolished, the crofters had become offici
integrated with the national agricultural scene so that speci
subsidies, grants, and loans were replaced with an opportunit
to apply for assistance within the national program of agri-
[24] cultural development. Instruction in scientific methods of
agriculture has been another continuing function of the gover
ment through a series of advisory services and, more recently
by a program of demonstration crofts and farms. Access to
markets has similarly been facilitated by improving communica
by land and, to a lesser extent, by sea.

Security and protection for the crofters has been anoth
unfailing interest of the government. Again, with official
integration, the scope of legislation has been extended to

427 651 crofter pays only half of the assessment, which is based on rental value, and he is granted an additional benefit by having the land devalued seven-eighths for purposes of taxation. The majority pay £3 a year, or less, in rent, and, with a rateable value of 5s, or less, between 1s and 2s in taxes annually. Many pay no taxes.

427 342 423 On his small plot of land the crofter has his cottage. Here we find another rather unique interpretation of the laws of land tenure. Although the crofter is an occupier of the land, he is the owner of his dwelling. If he or one of his ancestors did not build the house, frequently with a grant and/or loan from the government, he will have paid "compensation" to his landlord for the dwelling upon accepting occupancy. Should he, at any time, relinquish his right to the croft, the crofter, in turn, will be entitled to full "compensation" for the value of the improvements on the holding as determined by the Land Court. The crofter's home is not entered on the county valuation roll and, therefore, is not subject to assessment.

427 241 233 In addition to the land under crops and improved grass, the crofter's rent entitles him to a share in the unimproved township grazing lands which are held in common and used under [623] a system of allocation known as "souming." In each township, [624] the collection of individual holdings, the crofters elect a grazing clerk and committee. They determine the number of cattle, sheep, and horses the individual is allowed to put out to graze. Usually each crofter has an equal share, but in

some townships the large crofter is given an allocation in proportion to his rent. The payment of his rent also entitles the crofter to gather seaweed along the coast for fertilizer and to cut peat for fuel on the common grazing or in special peat areas. In a number of townships he has a further right to pasture his rams in a "tup park" and his horses in a "horse park." These are lowlying areas of improved pasture. There is the general picture. 427 241 [233] 222 [314] [233]

There are three important exceptions to the typical means of land tenure. First, there are the Glendale crofters who own their land. Each individual has purchased his croft, and the members of each township own the common grazing collectively. Before the law they are no longer entitled to the [654] benefits of crofting status because, by legal definition, the crofter is a small farmer who rents his land. Second, there [233] are the crofters of six Kilmuir townships who have individual areas of "outrun," good lowlying cattle pastures, in addition to the normal crofter's holding. Even though the Glendale crofters are landowners and the Kilmuir crofters have their own cattle pasture, they are subject to "souming" regulations. Third, there are a few large, isolated crofts which are self-contained units. The individual has his own cultivated land, pasture, and rough grazing. In reality, many of these large holdings are farms, but as long as the annual rent does not exceed £50, the benefits of crofting status are not withdrawn. The crofter, of course, stocks his holding as he thinks best. While the Irish and Scottish Highland systems of land use 427 423 421

While the Irish and Scottish Highland systems of land use reveal many underlying similarities, they are distinguished by their respective systems of land tenure. The Irish small farmer owns his land, like the Glendale crofters, and has a self-contained holding, like the large crofter on Skye.[3]

Croft Size. As the foregoing discussion has suggested, there is a wide range of croft sizes. Some crofters have only a few hundred square yards of the poorest soil. A few have large, relatively fertile holdings. One of these large crofters, for example, has 88 acres of arable land, 27 acres of pasture, and 1261 acres of grazing. The most common size is less than five acres, and not more than 500 of the 2200 crofters have over ten acres. If all of his land were of equal potential agricultural value, the individual with ten acres might be able to attain a satisfactory standard of production. Unfortunately, not more than half of most crofts can be considered as suitable for crop cultivation. In Glendale, for example, the average size is ten to fifteen acres, but when the boggy ground and the area in drainage ditches are subtracted, it is indeed a fortunate man who can profitably cultivate more than five acres. What, then, does he do with his land?

Land Use. Between spring ploughing and the harvest season, the best land is planted in oats, potatoes, and, in some cases, turnips. On most crofts, for every two or three acres of oats there are a half acre of potatoes, and perhaps, a quarter

[3] Arensberg, The Irish Countryman, pp. 36-38, 43.

acre of turnips. All of the cats and a large share of the potatoes and turnips are used to feed the cattle during the late winter and early spring. Some crofters, by no means all, have a small kitchen garden for cabbage, onions, and other vegetables. Usually, at least half the croft is left under grass, part of which is cut for hay. After all the people in the township have finished their harvest, on a day set by the grazing committee, the individual holdings in all but thirty of the townships are opened to communal use as winter grazings.[4] It might be added that the sheep and cattle often find the village of Portree a very lucrative pasture. It is not only the grass which entices the cows. More than one villager has had a tug-of-war with a cow bent on devouring clothes off the line. Another favorite food for the cattle is coal. As one man in the Braes said: "We burn half the coal; the cows eat the rest."

The Value of the Croft

What does a croft mean to the Sgiathanach? In terms of everyday economics, there can be no simple answer. For a few, probably no more than fifty families, the sale of cattle, sheep, and wool provides an ample income. The families are able to obtain the necessities of life and enjoy a comparatively high standard of living. The majority live on crofts which cannot begin to support a solitary individual. Expecting little more

[4] F. Fraser Darling, G. G. Hayes, and Averil Morley, "The Agricultural Situation," The West Highland Survey, F. F. Darling et al. (mimeographed, 1951), Part V, pp. 14-15.

than the bare essentials, these people just get along. Even so, they would be unable to get by were it not for some form supplementary income. This essential prerequisite for the individual or family who upholds the crofting tradition may take the form of seasonal employment on the island or away from home; contributions from a child or, less frequently, a brother or sister; or payments from the government in the form of unemployment compensation, relief, or a pension.

Many a Sgiathanach thinks of his croft as a home more than anything else. There are men who have found full time employment. Some in this catagory work the croft in the evening. Others expect their wives to care for the crops and stock, or they leave the land untouched. Then, there are the old men and women who have returned to their ancestral homes to spend the twilight of their lives. These exiles come back from cities as near as Inverness and from places as far away as the sheep ranches of Montana or the cities of Australia. Perhaps, the most significant point is that for all Skyemen the croft cannot be evaluated merely in terms of acreage and income. As we shall see, it is a way of life in which an attachment to the land, as an embodiment of kinship, plays a very important part.

The incomes of three representative crofts clearly reveal the financial difficulties under which the crofting family labors. Although I have somewhat arbitrarily divided the holdings into small, medium and large on the basis of acres of arable land, it should be remembered that this

he substantial tenants had their own private tutors, but the
eople, in general, received only informal schooling until
ell into the nineteenth century when several charitable societies
ntered the field.[85] All schools were essentially religious.
he act of 1872, and subsequent legislation, changed the program
nd made education compulsory for all. It was not until the
nd of the century that adequate facilities were available and
he system began to function, with the beginning of free
ducation.[86]

Informal control within the community was augmented by
he establishment of a rural police force, with headquarters
n Portree and local stations at convenient points around the
sland. Health and welfare became a responsibility of the
tate. A regional medical plan provided doctor's care and
ospital facilities for all regardless of means. Old age
ensions were granted to the elderly. Later, the scope of
ssistance for the infirm, aged, and the poor, and the un-
mployed was increased. Thus, the government continually
urped many of the functions of the family and the local group,
pecially following the abolition of the parish council in
909.[87] Although the parish councils, or the still older
arochial boards, had no legislative powers, they did handle
elfare and, until 1918, education. Now, in 1929, a Skye

District Council was established, but the only functions left
o the Islanders were such minor ones as providing recreation
rounds and maintaining footpaths. Today the members of the
Council can only make the local needs known to the county council
and carry out the functions of the county council.

In more recent years the functions of the county and
national governments have increased still more. Government
mployees have multiplied. After the Second World War, the
ounty became a landlord, building subsidized housing. Since
the county has built these houses at Portree and at a few centers,
such as Broadford, Uig, and Dunvegan, where the police have
their stations, they are still persisting in the attempt to
bring villages to the island. Roads have become the concern
of the county. Within this period, then, the crofter became
dependent on the county and national government for the satis-
faction of many of his needs. Although he resents authority,
he has not shown any resentment at the continual encroachment
of the government's services. To him the government is a
"rich man" who has bestowed many favors and may be asked to
bestow a few more, like electricity and plumbing.

Like European peasants in general, the Skye crofters
have lost three important things: isolation, political
independence, and self-sufficiency. At the same time, they
have retained a good deal of their former identity, a continuity
of culture, and an attachment to the land and to the traditional
way of life. The culture has been modified by adaption to the
higher socio-cultural organization, especially in material

175 K
178 K
181
178 K
737

181

culture which can hardly be distinguished from that of the
Lowland rural areas, but it has by no means disappeared.

Socially, these changes, particularly the introduction
of national laws of land tenure, involved a leveling of the
social hierarchy. The old polarity of the land lord and tenant,
with an intermediate group of doctors, ministers, and tradesmen,
was restored. The place of the tacksman, of course, has been
filled by the government. The bulk of the population was
once again undifferentiated socially or economically. Land
lost much of its commercial value for the proprietors. It
once again had more of an intrinsic value, almost as in the
days of the clan. The status of the proprietors, locally and
as a horizontal segment of the total British population,
depended on land ownership. The graziers and the proprietors
who had appeared during the "Clearances" withdrew, selling
out to the national government.

These changes did not work to halt the continuous outward
flow of the Scythenash. To the contrary, increasing integration
with the national culture created new needs, such as a demand
for a higher standard of living and an opportunity to achieve
status, and provided the training necessary for the youth to
find roles more suitable to their talents elsewhere in the
world. The young men and women of Skye journeyed to the
Lowlands to join the national labor force, to enter the professions,
or to seek other permanent employment. Thus, emigration changed
from a movement by families to a movement by individuals. At
the same time, the benefits of the crofters' legislation and
the program of government assistance made it possible for the

178 K
167
162

person who left in his youth to return in his old age. The
new pattern of emigration not only resulted in a continuation
of the persistent depopulation of the island but also, with
the return flow which countered emigration of the youth with
immigration of the older people, led to striking changes in
the age structure of the population. If the population pyramids
for the years 1861, 1901, 1931, and 1951 are compared, the
significance of the new pattern becomes apparent (see figure 4).
The 1861 pyramid has a strong base, despite evictions and death.
By 1901 the aging of the population was already marked. There
were fewer people in all age groups, but a disproportionate
increase in those over sixty-five. Females had joined the
exodus. Partly as a result of the emigration of young adults,
and partly as a consequence of a declining marriage rate and
delayed marriage, the structure was growing top-heavy.

The pyramids for 1931 and 1951 are far from ideal. The
differing movements of the population has resulted in a
situation in which the society can no longer reproduce itself.
Natural increase became a negative factor in the decade 1921-
1930. Since then births have exceeded deaths in only one
year, 1949. If the population is being maintained in part
by the return of exiles, one must not only ask who leaves and
why but also who returns and why.

178 K
167
162

An additional change within this period was the growth
of Portree as a trade center and as an administrative "capital."
The cycle of population, however, was erratic. In 1891 there
were 1,003 people in the village, but in 1921 there were only 793.

In 1951 the population stood at 1,094. There has been a slight
shift from the rural areas to the village, but it can hardly
be regarded as significant. For one thing, the 1951 figure
included an unknown number of workers on the hydro-electric
scheme. Then, too, it included children from the Outer Isles
who attend school in Portree, not to mention the very large
number of newcomers, teachers, government employees, shop-
keepers, management personnel in the stores and banks, and
tradesmen, to give only a few examples.

175 K
178 K

745

The trend toward religious conservatism continued in
the fourth period. During the closing years of the preceding
period, the Free Church attempted to modify her theology and
polity. The old trend toward relaxing the rigor of Presbyterianism,
in accordance with the feelings of the other dissenting de-
nominations in Scotland in order to pave the way for union,
was renewed by the passing of a Declaratory Act which stated
that the Free Church does not teach and does not regard the
Confession of Faith as teaching the foreordination of men to
death (eternal damnation) irrespective of their sin. Further,
that while the Gospel is the ordinary means of salvation, it
does not follow that all who die in infancy are lost. The
elders, the lay kirk officers, of Skye protested violently.
It was popery to make the Church the judge of spiritual affairs.
More important, it threatened their prestige status, which had
been sanctioned by the interpretation of the religious ethic.
In several parishes the elders threatened to withdraw from

Communion, and when they were backed by a few dissenting ministers,
schism gave rise to the Free Presbyterian Church. The first
congregation of the new church was a Skye congregation.

In no small way the threatened disorganization of the
culture and the suggested social disintegration at the end of
the "Clearances" played a role in the acceptance of the Free
Presbyterian Church. This situation, I suggest, created a need
to reaffirm the religious sanction of the desirable features
of the culture. Since the Church of Scotland minister in
Waternish was jailed for inciting the crofters to stand up
for their rights,[89] without adding any people to his congregation,
the new schism must have been a reaffirmation of the religious
focus for the culture.

The acceptance, however, was neither uniform nor
immediate. There was, in fact, a religious and social up-
heaval.[90] In Glendale, a strong Free Church area and a neighbor-
hood which required the presence of military troops to restore
order, family ties and friendships were broken in the contro-
versy over which church manifested the true religion. In
Staffin and the Braes, also areas marked by the need for police
protection, the same pattern was repeated. The experiences of
one Church of Scotland minister over the years following the
schism, led him to make a rather unusual statement for a man
who became one of the foremost ministers in Scotland: "The

[90] Ibid., pp. 143-212.

people of the Island must have had a premonition of the calamity that was befalling them when they resisted the coming of Presbyterianism with all their might.[91] For him, the form of religion which splits up communities, divides families, and breaks villages into fragments can scarcely be regarded as Christian. Over the years, however, the battle has been won by one church or the other, as in Glendale where the Free Presbyterian Church is the only kirk, or the battle scars have been forgotten.

Unions of the churches replaced the former tendency toward disruption. In 1901 the Free Church joined the United Presbyterian Church, and in 1929 the United Free Church joined the Church of Scotland. On both occasions there were ministers who refused to become a part of either united church, and people who were reluctant to join new congregations. In Kilmuir, for example, the Free Church congregation split. Some joined the Church of Scotland, while others remained true to their sect. Although all the churches on the island are similar in outlook and to the uninvolved observer their differences are unimportant, doctrinal differences have remained important to the people. Nevertheless, the common tradition of conservatism, standing in opposition to the increasing impingements of the outside world, has been the paramount factor in reinforcing the values of the people. I repeat, the culture has maintained continuity through religion.

[91] Ibid., p. 212.

Summary: The Cultural Trends

During the fourth period, in which the crofter re-emerged as the characteristic feature in the social and economic aspects of the culture, all the influences necessary for a readaptation to the wider socio-cultural level of organization were functioning for the Sgiathanach.[92] These influences were the presence of potential exports, access to markets, credit facilities, and a gradually improved technology. Several of these go far back in the local history. Cattle were being exported in the sixteenth century, being received by the clan chief and his tacksmen as partial payment for rent. Access to markets was available by the droving trade, but the subsistence economy precluded dependence on imports. Credit in the form of loans to the clan chiefs, on security of the clan territory, could be obtained, but it was directed to the support of the dignity of the clan rather than to agricultural improvements. At the close of the first period of the modern era sheep became commercially important. By the third period even with capital and the incentive to adopt new techniques were replacing the indigent tenantry. Communications had been improved. Access to markets by road, rail and steamship replaced the old drove roads, which would not serve for sheep. It was not until the government stepped in to halt the process of commercialization of the land, however, that the Sgiathanach was given an opportunity to directly benefit

[92] I am indebted to Julian Steward for the point of view which follows. Those who are familiar with his conclusions on cross-cultural regularities will discover many correlations between the cultural trends on Skye and those described for Puerto Rico.

from these influences. Now the government provided the capital, by grant, subsidy, and loan, and the guidance necessary for a fuller utilization of the land. The crofters who had already seen their subsistence economy disappear became a part of the national system of commerce. What effect have these influences had on the culture?

Throughout the modern epoch there has been a tendency to increase the production of exports, first cattle and then sheep, at the expense of the traditional subsistence crops. Within ecological limits, the national markets have determined what the Sgiathanach might produce. Since the environment has made Skye a pastoral land and agriculture is a poor risk in the best of years, abandonment of a subsistence economy has meant dependence on stock breeding for export. Commercialization of the land and increasing dependence on imported food has resulted in a growth of the importance of money. The decline in household industries, caused by economic deterioration, has also played its part in the people's dependence on currency. As a measurement of values, however, the importance of money has declined since the period of the large sheep farms. The crofter's margin of profit is small, and his opportunities to earn a wage are limited. Economic differentiation no longer affects the traditional status values, except within the traditional polarity of landed gentry and tenant.

In a comparable way, the utilization of more efficient methods of production is less important now than it was during the period of the "Clearances." Techniques have improved for the majority in so far as labor saving devices are available, but the achieving of modern efficiency is precluded by the

crofting system. Both the communal nature of the system and the smallness of the crofts deter improvement. Although the government reversed the trend toward making the land an important source of wealth and individualization of the land, by replacing customary forms of tenure with national laws of tenure, and has tried to correct the disadvantages under which the crofter labors, if not always successfully, the Skye crofter has made only a partial adjustment to the larger, specialized national culture. In fact, the land is used less systematically than it was in the past, in the times of the shielings. The crofters have not only ceased trying to reclaim arable but also have allowed much of the arable to go back to grass.

Ever since the closing years of the first period of the modern era, Skyemen have sought employment as a part of the national labor force. During the third and fourth periods, they joined the landless labor force in the Lowlands. There is practically no local opportunity for a landless man to support a family. The majority must remain pastoral agriculturalists who depend on seasonal employment, or some other form of financial assistance, to augment their income.

Improved communications and the ensuing development of commerce has brought a village to the island. It functions as a market center and as the administrative center for the island. It has not served to bring the island together; it is still something alien to their heritage. Accompanying the growth of the village, there was local development in the

crofting districts. Shops, schools, inns, and churches increased in number, but they have not clustered to form a village nucleus. In more recent years the county has tried to stimulate village growth by building houses at a few centers. Someday they may succeed in altering the settlement pattern.

As a consequence of the increasing integration of the Sgiathanach within the national scene, government regulations have expanded and have come to be enforceable by a local police. Government services too have increased in scope. Many of the traditional functions of the family and the local group are now functions of an ever increasing number of government employees. Nevertheless, the traditional statuses of the members of the group have persisted and social control has not been reduced in favor of action by the state.

The class structure has changed several times. It has oscillated between a leveling of socio-economic differentiation and a growing polarity of status. At present there is no local class structure beyond the old polarity of landed gentry and crofters. Those who fall between these groups are ranked on prestige values of long standing. Even though many of the intermediate group would be working or middle class if they lived elsewhere in Britain, on Skye personal factors play a more important role in determining prestige than socio-economic differences. Leadership and political power remain in the hands of the gentry.

If the foregoing material suggests that there is evidence on Skye for Redfield's concepts of disorganization

and individualization, there is little, if any, reason to speak of secularization. Many of the existing features of the culture can only be understood when viewed from the perspective of the religious aspect. Certainly, the state church has been weakened by schism and rational practices have replaced superstitious rites and beliefs, but this has not produced a secular society. The religious patterns have reinforced the traditional culture, or those parts of it which were considered worth preserving, by giving the culture a supraocial sanction.[93] Religion has bolstered the status values, especially those of the father in the family and the old men in the community. Religion has provided many of the occasions at which the people come together to find solidarity and security. Finally, religion has provided the focus for the culture. Although the factors of cultural change have led to modifications in the culture's content, there has been continuity. For a more complete understanding of how Skye has readapted to the higher level of socio-cultural organization and preserved its distinctiveness, I shall devote the remainder of the present study to an analysis of the contemporary culture.

[93] After writing the above account, I discovered that Arthur Geddes, a geographer at Edinburgh University, has recently discussed some of the evidence for cultural continuity on the Isle of Lewis and Harris, one of the Outer Hebrides. Although he takes important notice of the all-pervading influence of religion in the lives of the Hebrideans, past and present, I feel he overlooks the function of religion as an agent for maintaining cultural continuity. See Arthur Geddes, The Isle of Lewis and Harris: Study in British Community (Edinburgh: Edinburgh University Press, 1955). [See 1; Geddes, this file--Analyst]

CHAPTER V

THE ISLANDERS' ECONOMY

The basis of the local economy, in terms of the contribution of the Sgiathanach to the national economy and the number who depend on the land for all or part of their livelihood, is the crofting system. We must, therefore, explore the economic aspects of this cultural pattern in detail. As a system of land use and tenure, crofting is an anachronistic survival in Western Europe. Elsewhere, the medieval agrarian systems have been repatterned along four principal lines.[1] In central and some parts of northern Europe peasant proprietorship became the characteristic feature. In southern Europe the métayer, a peasant who paid a rent plus a share of his crop, appeared. Northern Europe became an area of large farms. In England and Lowland Scotland tenant farmers received most of the land. There is only one survival of the old open field village farm in England.[2] Despite individual efforts of Highland landlords to bring about at least a partial assimilation of the increasingly backward economic patterns with those of rural Britain, crofting has been perpetuated. Certainly, the legal enactment of 1886 helped to

[1] Barnes, The History of Western Civilization, Vol. I, p.636.

[2] Lewis and Maude, The English Middle Classes, pp. 169-170.

include all small tenants in Scotland. The landlords have lost their right to evict a crofter for breach of conditions. Since 1911 only the Land Court, which replaced the Crofters Commission, can remove a tenant who is guilty of bad husbandry. Moreover, such action can only be taken after the general circumstances of the crofter and his need of the croft for a home have been considered. To date, no Highland crofter has been removed. In fact, security of tenure has been carried to the extreme that the individual no longer has to reside in Scotland much less on his croft. Although this change is now regarded as inadvertent, the courts have ruled in favor of the small tenant. The only remaining functions of the landlord in estate management are to collect his rents and pay compensation should a tenant desire to leave. Both the rents and the compensation are determined by the Land Court.

Accompanying the integration of the Island with the national scene, politically and economically, were extensions of social services. Prior to 1872 education was the responsibilit of the church, charitable agencies, and, especially in the Highlands, the local proprietors and their financially secure tenantry.[83] Although the parish school system was national, the administration of each parochial school was local. The ideal of a school in each parish was neither adequate nor easily obtainable. The result was a few regularly taught schools.[84]

[84] James MacDonald, op. cit., pp. 771-774.

241/427 restore it from the throes of disintegration, but even more important was the disinclination of the people to accept any fundamental changes. Indeed, only the following three features essential to crofting distinguish the system from that characteristic during the days of the clan: (1) individual arable land held in compact, permanent plots rather than dispersed and shifting cultivated strips, (2) the payment of a money rent rather than providing services and a share in the produce to the landlord, and (3) legal protection of the tenant from the potential abuses by the proprietor or an intermediary.

The Croft

427 Land Tenure. The majority of Skye crofters rent a small acreage of arable and improved grass land from a landlord or the Department of Agriculture for Scotland. Although the crofters pay an annual rent, their rather unique form of tenure, granted under the Crofters' Act of 1886 and subsequent legislation, confers upon them almost all the rights of land ownership with few of the responsibilities. The crofter has security of tenure, the right to bequeath his land to a member of his family, and relative freedom in deciding what use shall be made of the croft. His nominal rent very often has not been increased since the time of the Crofters Commission. Even where the Land Court has revised the rents, they are not substantially higher than those set at the turn of the century. If his rent is nominal, his taxes 427/651 are negligible. In Scotland property tax is paid in equal shares by the owner and occupier. Thus, as an occupier, the

the cash income was £1044 3s 3d for 1952 and £1527 3s 9d for 1953. I do not know the net profit.

Summary. The foregoing facts and figures should make it abundantly clear that a man with less than ten acres of arable land and with a "souming" of less than three or four cows and fifty sheep can expect only a meager and definitely inadequate return for his investment of time and money. Several crofters thought thirty or forty acres were required. This would mean a "souming" of 10 or 12 cows and 200 sheep, if the present proportion of grazing land to cultivated area were maintained. Some said 300 to 500 sheep would be closer to the mark in order to make a good living on the land. The budget for the large croft confirms this view, but even then we have seen crofting to contain a precarious element of risk. Most crofters felt that with twice their present acreage and "souming" they would be faced with a less hopeless proposition.[6] This, of course, would involve a further, coerced reduction in population. But this is all a matter for future planning. What we want to know is the contribution of crofting to the local and national economy.

The Contribution of Crofting to the Economy

If we are to determine the value of agricultural production from crofting, we must consider not only the crops and

[6] It is not only the Skyemen who want more land; see The Report of the Commission of Enquiry into Crofting Conditions (Edinburgh: Her Majesty's Stationery Office, 1954), pp.18-19.

stock grown for local household consumption and export but also the subsidies and grants provided by the national government. I hasten to add that it is impossible to estimate accurately the specific contribution of crofting to the economy of Skye. There is no available means of distinguishing the status of crofter from that of farmer in the annual returns of crops and stock or in the applications of farmers and crofters for subsidies and grants. Before getting down to pounds and shillings, we may find a brief digression to review the acreages of land devoted to crop and stock raising and the yields to be expected helpful in our attempt to understand the many problems under which the Skyeman labors.

The total area of Skye is approximately 447,000 acres. Of this area, 422,415 acres were classified, in 1953, as rough grazing.[7] The land under cultivation, excluding grasses, was only 3,254 acres. There were 6,258 acres of grass intended for use as hay and 12,339 acres of permanent grass or improved pasture. The remainder, about 2,500 acres, was unclassified.

The stock, in 1953, was 1808 dairy cows and heifers, 8,108 cattle, 143,422 sheep, 41,888 fowls, 436 horses, and 319 pigs.[8] The dairy cows are mainly beef breeds which give a low yield of milk. The sheep are primarily the hardy blackface variety but some crofters have cheviots, which produce a finer wool. For each sheep there are about three acres of grazing

[7] Agricultural Returns, June 4, 1953, Department of Agriculture for Scotland, Edinburgh, Scotland (in the files of the Department). These figures include adjacent small isles.

[8] Ibid.

and for each head of cattle, some forty-five acres.

The crops are not only limited in acreage but also in variety. Since there were less than ten acres of barley, which was cut green for silage, it may be said that the only grain is oats. The yield of the 2292 acres of oats was a low twenty-nine bushels per acre. The variety grown (Sandy) is not a threshing oat. It is fed to the cattle in the sheaf. This, of course, means seed oats must be purchased in the spring. The only other crops of any importance were 587 acres of potatoes and 99 acres of turnips. The yield for potatoes was about five tons per acre and for turnips, fourteen tons per acre. These yields do not satisfy the needs of the Skyeman and his cattle. The hay was poor in both bulk and quality.

It will be seen from the preceding discussion that the livestock industry is the basic factor in the economy. The production of crops is of no more than limited secondary importance. Let us now look at the value of the agricultural production on Skye in terms of locally consumed produce and exports. The following figures represent a collation of facts and figures generously provided by the Department of Agriculture for Scotland, the North of Scotland Agricultural College, and local officers of these bodies. For brevity, I have set them out in Table 2.

TABLE 2

ESTIMATED VALUE OF AGRICULTURAL PRODUCTION ON THE ISLE OF SKYE

Produce	Total Marketable Production[a]	Local Consumption[b] (Household & Croft)	Exports
Oats	£ 3,500	£ 3,500	£ ....
Potatoes	23,500	23,500	....
Turnips	2,000	2,000	....
Hay	24,000	24,000	....
Sheep and Lambs	70,000	20,000	50,000
Wool	50,000	10,000	40,000
Cattle	90,000	20,000	70,000
Milk	30,000	30,000	....
Poultry and Eggs	40,000	40,000	....
Pigs	6,000	....	6,000
Miscellaneous	5,000	5,000	....
Totals	£ 344,000	£ 178,000	£ 166,000

[a] Based upon assumed yields from crop acreages and stock reported to the Department of Agriculture for Scotland.

[b] Consumption includes an allowance for loss of stock.

The estimated income from the sale of stock and produce amounts to some £66 per holding. One of my informants, an agriculturalist of wide experience, thought that the estimate was too high. He would put it at £126,000, or £55 per holding. In addition to the actual production, we must consider government subsidies and grants.

The most important subsidies are those on hill sheep and hill cattle. Each of these average over £30,000 annually. There are also calf rearing subsidies, marginal land grants, and several other available sources of aid which amount to some £20,000 each year. Thus, the total income for the Skye crofters and farmers is increased by roughly £80,000. Production and subsidies together give an average income of about £100 per holding. We have already seen that the crofter's income may be either a fraction of this figure or several times the average income depending upon the size of his croft. To fully understand the significance of this fact and to explore further the evidence for cultural continuity, it is desirable to inquire into the seasonal routine of the crofters of Skye.

The Annual Economic Cycle

As crofts are delimited according to size and potential income, the crofters may be classified as full-time, part-time, and spare-time pastoral agriculturalists. Obviously, all crofters who work the land will follow a similar schedule, performing more or less the same variety and succession of tasks. There are, however, significant differences in the

amount of time which is allotted to each activity and in the 221
pressure on the crofters to complete each chore within a
relatively definite period. There are also differences in the
number of non-crofting activities in which the individual can
or must engage. Let us follow several crofters through the
year to see what these differences are.

The Full-time Crofter. One might say the year for the full- 221 236
time crofter begins during the first week of January when he 232
goes out to the hill to bring in his rams. This is the first
break in the monotony of his winter schedule, but it is only
a momentary break. Not until March does his season of pro-
longed labor begin with the first "dipping" of the sheep to
rid the animals of tick and parasites. He and his wife, [476]
their children, if they are old enough, and their neighbors
or hired hands, crofters from nearby townships, join forces.
Several of the men go off to the hill to gather the sheep and
herd them down to the "fank," a stone or sheet iron inclosure
consisting of either two or three pens, a trough for the
"dip," and a shearing platform. While waiting for the sheep,
the remaining men and women prepare the "fank" for the day's
work. One by one the sheep move through the pens until all
have been picked up bodily and submerged in the medicinal
bath. The women not only help their fathers and husbands at [462]
the "fank" but also prepare a noon meal for the group.

Following the dipping, the crofter turns his attention 221
to the soil. By late March or early April he has ploughed, 241

manured, harrowed, and limed his fields. Normally, he will 221
have a tractor to speed his work. In the meantime his wife 241
prepares her small kitchen garden. By the time he has sown [462]
his oats and set his potatoes and turnips, the ewe sheep are 221
ready for lambing. Lambing begins during the last week or two 231
of April and runs through the middle of May. This is one [462]
activity which is exclusively man's work. It is also a chore
which demands an early start from individuals who are normally
late risers, seldom getting started before eight or nine in
the morning. Now, all day long, from early morning until late
at night, day after day, the crofter or his shepherd are found
on the hill watching and waiting for the lambs and their
natural enemies, the crow, the hawk, and the fox. During this
time, he does not neglect feeding his cattle nor finishing
putting in his crop if inclement weather has hindered his
progress. Then, too, he may have a cow ready to calve. His [462]
wife will then add milking to her regular household duties.
Men have only recently begun to milk.

After lambing, the family must decide whether or not 221
they are going to take time out for cutting peat. As I have 314
already said, it is unlikely that the man of the house will
want to bother. He has enough to do caring for the sheep and 221
lambs and preparing his cattle for the May markets. Although 231
he could attend the local sales which are held at convenient 432
locations around the island, the large crofter has found the
mainland market of Dingwall attracts buyers willing to pay
higher prices.

If May is considered a busy month, June duties are even 221
more pressing. Although the winter sales are over, the rain- 231
fall has begun to increase. A succession and variety of de- [132]
mands are made on the crofter's time. Once again the sheep
must be brought down to the "fank." This time the purpose is
to mark the lambs. The males, unless one or two healthy
specimens are selected for future use as rams, are castrated
and smeared with a dye to indicate their ownership. The
females are smeared and have their ears cut to signify both
ownership and age. Like the dipping, this operation requires [476]
the cooperation of the crofter and his family, the neighbors,
and hired hands. Next the sheep without lambs are dipped [232]
once again and given a dose of medicine for liver fluke and
a variety of diseases. At the same time, the early hay and, 241
perhaps, the early potatoes are ready for harvesting. The end [513]
of June brings the Highland Wool Fair in Inverness. If he [233]
has Cheviot sheep, as most crofters do, the man must go to
arrange for their wintering on the milder and drier east
coast. Although Cheviots produce a finer wool than the more
common Blackface sheep, they do not stand up to the incessant
wind and rain of a Skye winter. If his wife can leave the
children behind, she will accompany her husband. The old [534]
function of the Fair, the sale of wool, has disappeared under [256]
government price control legislation.

It is not unusual to have the early harvest delayed 221
until July, but even then the mowing may have to wait because 236
sheep must come first. On one of the dry days during the first 241

or second week, the ewe sheep are sheared. Shearing is an- 221
other cooperative task. The men and women work together 236
with only one significant division in their labor. Women [462]
never shear. Their task is to run the sheep through the pens
and fold the fleece after the two men shear the animal. An-
other chore is added to the crofter's schedule at this time.
He must begin to watch his sheep for maggot.

The haying season runs through July and August, depend- 221
ing on the weather. In August the sheep have to be dipped again 241
this dipping prescribed by law, and the wedder lambs (castrated [232]
males) are sent to market. In September, if the weather is
favorable and the season has been good, the harvest of oats
begins. The man works with a scythe. Women never cut. His [462]
wife helps by binding the corn in sheaths by hand and making
stoops in the field. Later she helps her husband build the
stacks for winter storage. As in any summer month, the stock 221
requires attention. Cast ewe sheep (sheep over six years old) 231
and old rams are sent to the Ministry of Food grading station
at Kyle, on the mainland, to be graded for meat or to Dingwall
to be sold at auction. Cattle sales are also held on the [432]
island in September and again in November, but the full-time
crofter prefers the Dingwall auction. The rainy season is [132]
now, as noted, reaching its height. The pace becomes slower.
October, November, and, perhaps, even December are spent trying 221
to dig potatoes and turnips. Too often the oat harvest has 241
yet to be completed and the sheep must receive their second [232]
statutory dipping. Sometime before the end of November the 221
236

wool must be packed for shipment. As November ends the rams 221
are put out with the flock. 236
[232]

Winter is a slow season for men, but it is not an idle 221
season. The cattle must be fed. The man fetches oats or hay 233
from his stacks and some turnips or potatoes from his storage
pits and carries the feed on his back to his cattle on the hill.
Very rarely does he keep them in a byre because to do so he
would lose the government subsidy on hill cattle. Although [232]
the sheep are now free from pests and most diseases, he must
continue to periodically walk the hill to check their condition.
Very few bother to feed the sheep in winter. Another task is [231]
the butchering of a few sheep. While not quite legal until
last year, one crofter justified his activity by asking,
"What would we eat if we didn't kill our sheep?" Once in a
while, he may also kill a steer, but unless several families
share the meat, salt beef becomes rather monotonous.

The crofter's wife keeps busy all winter. Her routine, 221
broken by helping at the fank a half dozen times a year and 462
with the harvest, continues through all seasons. As far as [231]
the actual work on the croft goes, she milks the cows, feeds 241
the poultry, and cultivates her garden. When she is not cleaning
the house, cooking meals, making butter or cheese, caring for
the children, or looking after her husband's needs, she knits.
She also does the shopping, either from a food van or on a [432]
weekly visit to Portree. Men are as disinclined to shop as they
are to wash dishes.

normally determines the "souming," the number of stock which each tenant is entitled to carry on the common.

7 The small croft has less than ten acres of arable and improved grass land. The average "souming" is two cows and followers (heifer or bullock calves) and usually ten to twenty sheep. Approximately 2000 of the crofts fall into this classification. The medium croft, representing about 250 landholding subjects, has between ten and twenty acres of land fit for crop cultivation and improved grass. The typical "souming" is two to seven cows and followers, forty or fifty sheep, and occasionally, a horse. We might recall that the sheep may be either a club stock or a private flock. The large croft consists of almost 100 arable acres and, even more important in the predominately pastoral economy, an independent, self-contained grazing of 200 to well over 1000 acres. These diminutive ranches easily carry ten or more cows and followers and several hundred sheep.

For those who prefer to think in terms of area rather than stock, the relative magnitude of these self-contained holdings may be stressed by adding the fact that only thirty townships on Skye have more than 200 acres of common grazing. Here are, for example, Linicro with 729 acres of grazing in shares, Totescore with 500 acres in 12 shares, and Arnesketaig with 273 acres in 47 shares. Over half the townships have less than 100 acres of grazing land.[5]

[5] Ibid., Table 3.

427 241 231 134 The Income of a Small Croft. The small croft is regarded by local agricultural experts as having a potential income of £20 a year. In addition, it provides a home, potatoes, some vegetables, milk, eggs, and the right to cut peat. Even if not quite legal until June, 1954, it frequently supplies mutton and, less often, beef for the family. The budget for this type of holding in my sample reveals that even when fully stocked and the ground tilled, the income may be negligible. Let us look at the cash income and net profit for 1952 and 1953.

In 1952 the cash income for the croft was £8 13s. 11d. The net profit, which takes into account depreciation and stock valuation after sales was £2 1s. 11d. In 1953 the cash income was £12 8s. 9d., and the net profit was £5 8s-. These figures include money from the sale of stock, government subsidies and grants, and home grown produce eaten by the family. Unfortunately, I do not know the number of hours which were spent earning this meager return. The crofter's wife said about 300 hours of her labor. To this we must add seasonal cooperative labor.

This particular croft is rented by a middle-aged married couple and a spinster sister of the wife. The man works full time as truck driver, leaving most of the work on the croft to his wife. The stock is two cows and followers and sixteen to eighteen sheep. There are six acres of arable land, half of it under hay and grass. The remainder is planted in oats, potatoes, and turnips. The budget may not be typical. For

427 241 231 134 124 one thing, an attempt is being made to build up the va the sheep and cattle stock. Then too it is hard to ob information on personal income. Not a few Highlanders reluctant to share in the cost of maintaining the gove and, consequently, equally reluctant to discuss their Still, it does give some indication of the potential i for 80 percent of the Skye crofters. It should not be gotten that a large proportion of the small crofters w have absolutely no income from the land.

The Income of a Medium Croft. The medium croft, accor to experts, has a potential income of £150 to £200 a Like the small croft, it provides a home, potatoes, ve tables, milk, eggs, meat, and peat. The budgets for o croft of this classification for 1952 and 1953 show a income of £203 17s 2d. and £170 15s. 11d., and a net p of £169 12s. 1d. and £96- 11d. The marked fall in net is accounted for by a decrease in the acreage under oa increased expenses, and the sale of fewer and younger which also affected the cash income. The total hours to crofting are estimated at 600 to 800 hours.

This croft supports a family, a married couple a children, supplemented by seasonal auxiliary employmen part of the father. As presently worked and stocked, i not be left to a woman with any expectation of the sam The stocking is two cows and followers and fifty sheep. are 16½ acres of cultivated land, all but a quarter un

427 241 231 434 This budget is nearer the estimate of the local Department of Agriculture officers and may be regarded as typical. It also reveals that crofting is not a dependable livelihood. My budget for the large croft manifests the pitfalls in crofting by an even more striking contrast between the two years.

The Income of a Large Croft. The large croft is said to have a potential income of £800 or more each year. The holder will be a full-time pastoral-agriculturalist. In reality, as mentioned earlier, the large crofter is a small farmer and often has more land than some Skye farmers. His holding cannot be regarded as providing a home, even though his rent and taxes will be extremely low compared to the farmer's. Nor does it normally, if ever, provide peat for fuel. The peat is there, of course, but the crofter does not have time to dig it. Indeed, if he were to take the time or hire someone to do the digging for him, the cost of peat, in terms of man hours approximately £10 a ton, would make it uneconomical, especially since it has only a quarter the caloric value of coal which he can and does buy for less. Like the smaller subjects, the large croft provides vegetables, meat, milk, and eggs for the table. The sample budgets which I obtained for a large croft show a cash income of £536 11s.5d. for 1952 and £802 7s.1d. for 1953. The difference is explained in part by increased sales of stock and in part by increased government subsidies. The net profit for the two years tells a far different story. In 1952 it was £829 6s.5d., but in

1953 it was only £313 2s.1d. This marked fall was due to the loss of sixty-nine sheep and one head of cattle, the effects of which would not be felt until the following year. 427 241 231 434

This croft is inhabited by a married couple, and the husband's father and younger brother. It requires the full attention of both brothers and, occasionally, hired labor, in particular in the spring when the sheep demand a great deal of attention. The income in 1953, it may be added, was considerably more than most Scottish tradesmen and not far below that of a university lecturer. The stock averages between five and ten cows with followers, ten head of beef cattle during the summer, and 400 sheep. The cultivated acreage is fourteen acres, usually half of which is under hay and grass. I regard the large croft in my sample as typical, but it is typical of less than 1 percent of all Skye crofters.

The Income of a Farm. For comparative purposes, I should like to briefly consider the cash income of one farming subject. The budget I obtained is far from typical. With twenty-one farms each with its own peculiar advantages and each farmed under differing technological conditions, I doubt that a representative type could be singled out. Moreover, the only way I could obtain a farmer's budget was to secure it surreptitiously; therefore, I do not know the details of stocking or the number who derive their support from the farm. We may be certain that it is one of the larger sheep farms. Despite an expense for hired labor of over £1000 each year, [124

he Part-time Crofter. The part-time crofter follows much the 221
ame schedule and shares the same succession and variety of
hores. Indeed, some are not so much part-time crofters as 464 182
hey are part-time employees. As such, they are successfully
reserving a traditional economy no longer en rapport with the
urrounding twentieth century commercial world by depending upon
conomic benefits of contractual relationships to the smallest
ossible degree. One fellow saw the situation this way: "We
on't need factories and the like; what we need is something
hat will give us time to attend to our crofts." Others feel [829]
hat if they have to abandon the traditional way of life, they
ight just as well leave the island for places where greater
pportunities for social activity are joined with relative
conomic prosperity.

The part-time crofter has less land than the full-time 221 241
rofter and less need for cultivating all of it because he
as fewer cattle to feed during the winter. He, therefore,
evotes less time to tilling his soil. On the other hand, 221 231
lthough he has fewer sheep, the collective flock of his town- 476
hip is almost always larger than the stock of a large croft.
onsequently, he spends more time dipping, marking, and shearing
heep in cooperation with his neighbors. Hired labor plays 231 464
minor role in the townships. Often the only hired hand is
ne of their number who assumes the responsibility of shepherding
he flock. Some of the townships with club stocks, however,
ave adopted the practice of paying each shareholder for his
abor out of the profits to encourage cooperation or to penalize
those who do not do their full share.

those who do not do their full share. 000

The year for the part-time crofter begins with the prepa- 221 241
ration of his fields. As a general rule both the man who spends
his winter working for the British Railways or away at sea, and
the one who finds summer employment near home is found on his
croft during this period. Following the example of the large
crofter some use a tractor while others continue to plough by
horse. More and more are tending to take advantage of the con-
tracting service of the Department of Agriculture and hire a
tractor and driver. Once the crops are in, the majority are
free until the lambing season. Conservative in his belief 221 333
that too much handling of the sheep is harmful or individually [832]
faced with the almost prohibitive task of singling a small
flock out of several hundred sheep, he tends to omit the March
dipping. During the lambing season, the several crofters of [476]
the township either take turns on the hill or hire a shepherd.
The first chore, then, which brings them together as a group
is the marking of the lambs and the first dipping of the sheep
without lambs. The July shearing and the statutory dips in [476]
August and November are cooperative ventures shared by all
crofters no matter what size croft they occupy.

In sundry ways, economic interests, judged in terms of 231 432
commercial efficiency, play a smaller part in determining the
economic cycle of the part-time crofter than in the case of the
full-time crofter. The part-time crofter does not think it
worthwhile to ship his few head of stock to the mainland
auction markets. He sells them locally at the tri-annual sales.

As far as I know only one attempt has ever been made by the 231 432
smaller holders to sell their cattle at the large mainland
markets since the last drove left Skye in 1906. There was a
feeling at the close of the Second World War among the crofters
that they were not receiving a fair price at the local sales.
The Scottish Wholesale and Cooperative Society, which had be-
come interested in the Highland Problem, offered to handle the
marketing. Their cattle buyer, a man of wide experience, found
the Skye cattle to be of high quality and suggested shipping
them to the Stirling market. This is one of the largest in
Scotland has the advantage of attracting a full range of buyers.
Since the cattle were not at their best after the long sea
voyage, they were provided with hay and pasture for a week
after arrival. Unfortunately, a disease epidemic in the
South forced a postponement of the market. Nevertheless, they
arrived at the auction block in good condition. The prices
obtained, an average of £1 or £2 more than they normally re-
ceived at the local sales, convinced the crofters that there
was no advantage in selling on the mainland. Actually, if
the Society had not paid the expenses of shipment and feed,
the crofters would have suffered a slight loss. Those who
attend the Dingwall sales say they used the wrong market.

While the man who devotes all of his time to his 221 314
pastoral-agricultural occupation finds it uneconomical to 241
bother with gathering seaweed for manure, fishing, or cutting
peat, the crofter of the category we are discussing often
adheres more closely to the traditional cycle. After the

lambing season, the crofter and his family go out on the moor to cut their peat for the following winter. The man uses a "tusker," a two-bladed spade, to cut the peat. His wife or his children follow behind, tossing the peats out of the ditch and building small, loose stacks for drying. After the lambs have been marked and the sheep dipped in June and the shearing finished in July, the family returns to the banks to carry the peats to the nearest road, actually a beaten cart path, in creels. They are then carted home and stacked near the door. There is a growing tendency for both the part-time and spare-time crofter to give up cutting peat. It is not because coal is cheaper or he needs time for other pressing chores. His auxiliary occupation will not permit his devoting the necessary time to this long and arduous task. He is caught between the traditional economic patterns and the money economy of which he has become a part.

The year for our part-time crofter, as for all active crofters ends in November. By then the oat and hay harvest has been stacked by the house and the potatoes and turnips stored in the ground, the wool shipped off to market, the surplus sheep and cattle have gone to market, and the rams are on the hill. Now follows a period of enforced idleness, broken by feeding the cattle. As we have seen many go away to find employment, leaving the care of the croft to their wives who have shared the work of crofting in addition to their own womanly responsibilities. We must turn to the spare-time crofter to discover just how heavy the burden of labor may depend upon the women of Skye.

depend upon the women of Skye.

The Spare-time Crofter. Under this type we must include not only the able-bodied, married man who tends to become a full-time wage earner, but also the old, pensioned, married and unmarried men and women who are no longer able to perform the necessary chores. For the latter, whether they have a small or medium-sized croft, the croft becomes a means of living within a pension rather than a potential source of livelihood. For the former, the croft becomes a means of living cheaply.

When the crofter goes out to work, he either tends to neglect the croft or expects his wife to manage it. Occasionally, the husband will help with the ploughing or the harvest in the evening, but he never lends his wife a helping hand in her domestic duties. The only men on the island that I knew who helped their wives with the dishes or the care of the children, except disciplinary measures, were a minister from the Outer Isles and several Lowlanders in Portree. Since very few crofters have plumbing, the wife must fetch water from a well and dispose of waste in the nearest stream. If there is to be a supply of peats, she must cut them. If there are cattle and sheep, she looks after them. Lambing may be left to the township shepherd if the crofters can afford one, and shearing is usually left to the men of the township. An exceptional spinster or widow may shear, but it is indeed an unusual married woman who will break with the traditional

division of labor. During the summer, she will milk the cows, and in the winter she will see that they are fed. If there is to be a harvest in the autumn, she will care for the crops.

Some women, in particular the older ones, plough with the caschrom, the foot plough. Other women use a small power driven plough or contract with the Department of Agriculture to have the ploughing done. The Department will also provide the men and machinery to harrow, cultivate, spread lime and manure, mow hay, cut and bind oats, dig potatoes, and thresh grain. By utilizing these services, if they can be afforded, the small crofter can free himself or, at least his wife, from many arduous tasks. The need for cooperation of the family and neighbors is thereby reduced. Although traditional mutual aid is being replaced by cash payment for labor, it is not the labor of a landless working class which commercialization often creates, but rather state provided services. Significantly, most Department employees are newcomers. The Skye man who works for the Department is a better worker away from the island. Since few are able to pay for these services, the wife digs the potatoes, and some women use the scythe to reap hay and oats. The scythe, it will be remembered is really a man's tool. Frequently, the break with tradition is avoided by the return of a son from the mainland or the sea. Running the household and working the croft is not all some women do. They also take in summer visitors, by the day or week, and provide teas for travell

In summary, it may be said that crofting is anything but an easy life with ample rewards. We have seen how meager the

each township as a sign of contempt.[10] This suggests that 476
the practice of helping one's neighbors with the harvest was 241
relatively recent. Again in the matter of cutting peats, 178
829
frequently described as cooperative, and a communal under-
taking as late as 20 years ago, there is disagreement. All
in the township used to work together, cutting for each crofter
in turn and enjoying a festive picnic. "Sure they would,"
others told me," but first they would cut for the minister
and then for the shopkeeper." The shopkeeper was more important
to them in those days because they would all be in perennial
debt to him, and he might extend a little more credit if they
were in his good graces. They would then cut for each other.
By the time they got around to the old widow with no one to
cut for her, they were all too busy. The sheep had to be dipped
or the fields needed attention. I have heard conflicting
versions of these stories from neighbors. Are we to conclude
that cooperation varied from door to door and township to
township?

The growth in importance of sheep as a major source of 236
income, associated with the decline of the old subsistence 476
economy, led to new patterns of cooperation. To be economic 178
sheep must be raised in numbers. As we have seen, physical
cooperation is imperative, and many crofters cooperate finan-
cially, pooling their capital and dividing the profits. This
is true of the nine townships of Kilmuir. Moreover, even in
townships where the crofters have rejected the club stock plan
the individual flocks are generally handled as club stock.

[10]Cf. William MacKenzie, Skye: Iochdar-Trotternish, p.59.

In Claigan, for example, the crofters felt they would do 236
better with private flocks than with a club stock. Although 476
each man now has his own sheep on the township grazing, they 178
are cared for like any club stock. The four crofters are
needed for success at the dippings, marking, and shearing,
and they are always at the fank on these occasions. In larger 236
townships, those with ten or more holdings, the need for all 476
the crofters to help out at the fank is less pressing while 621
632
the felt need for auxiliary employment is stronger. In con-
sequence, the cooperative work habits run less smoothly. In
an attempt at adjustment, many townships have resorted to
paying the share holders for their labor from the profits.
To the best of my knowledge, only one township has witnessed
the total suppression of the cooperative spirit; all the
crofters are too busy with full-time employment to bother with
the steadily declining sheep stock.

Nevertheless, it has become commonplace for the crofters [829]
to complain of at least one individual in the township who
does not pull his full share, someone who is "trying to
sabotage the whole thing."

Independence is a personality trait, but it is best 157
described as a steadfast determination not to conform for the 476
mere sake of conformity when an innovation handed down from 829
the outside commercial world is at stake. The old ways are the 888
best ways, even if only the old men think so. It is the old
men who uphold the traditional practices. As long as they do,
and as long as unanimous consent is required for any change,

157 the Highlander will be "independent." As for being "just not
476 cooperative," what the critic really means is that the crofter
829 is unable to cooperate in the ways city people or more sophisti-
888 cated farmers do. The cooperative movement has come to Skye,
but it was not a local venture. The Scottish Cooperative and
Wholesale Society opened its shops, without shareholders. The
distinction between the crofters' simple cooperation and so-
phisticated cooperation, including capital investment, does
not invariably hold.[11] There are sheep stock clubs. Govern-
ment loans, of course, provided the initial capital.

476 In dealing with the topic of cooperation, as any part
621 of the economic aspect of the culture of the Sgiathanach,
632
the basic importance of the township again and again emerges.
Only a few crofts exist apart from a township. A more detailed
analysis of the township system and the pressures it imposes
on the crofter is, therefore, in order.

The Township

621 The efficient unit in the local economy is the township,
632 the modern equivalent of the joint-tenants' and tacksmen's
farms. Each township consists of a variable number of individual
holdings, the low-lying arable and improved grass land held
under hereditary tenure, and a more or less extensive area
of rough, unimproved hill grazing held in common. The common,
concurrent right of each crofter to use the hill grazing under
the "souming" principle gives the township its focus.

[11]Cf. Darling and Morley, loc. cit.

361 The number of holdings which can be carved from the land
632 in any one place and the proximity of these clusters of crofts
162
to each other are determined to a large degree by the limiting
influences of the environment. Landforms, climate, and soil
have always restricted settlement to the coastal fringe and
a few internal glens. Although the Sgiathanach has abandoned
his former dependence on a subsistence economy, the original
cultural adjustment, these natural features continue to exert
a negative influence. Each man must have some arable land to
provide winter feed for his cattle and to winter his sheep.

If the low-lying area is small and isolated, only a
few holdings can be laid out. If the fertile area is large,
the influence of the environment is less direct. In either
case social and economic factors are important. The small
isolated townships are invariably unsuccessful. A few, like
Point of Sleat, are completely empty. Others are all but
derelict. There is Kylerhea in Sleat where no children have
been born in over fifteen years. Suisinish in Strath, a
township well remembered from the days of the "Clearances," when
a minister's sheep replaced the inhabitants, is now inhabited
by an old man and his two elderly bachelor sons. All of these
476 failing townships are at the end of a road. Whereas the
231
162 minimum size was once four able-bodied men, the number in a
plough team or a boat crew,[12] it is now three. This functional
trio is indispensible for the care of a sheep stock large
enough to be worth keeping. Even three families do seem to
satisfy the social minimum.

[12]Ibid., pp. 1-2.

The maximum is harder to determine, economically. There is some limit to the number who can stock a common grazing with individually owned stock without becoming involved in complicated entanglements over right, obligations, and questions of ownership. The few townships containing more than thirty crofts in the Western Highlands (91 out of 957),[13] and the negligible number on Skye (only ten), suggests that less than thirty holdings per township, no matter how much fertile land surrounds the cluster, has been found to be the optimum. Most of the townships contain between five and twenty crofts. The fact that many large, adjacent townships, such as Bornesketaig in Kilmuir and all those in the Braes, are losing their population is a reflection of a many faceted condition we have been exploring throughout this chapter--the vast majority of the crofts are too small to provide an adequate livelihood. One of the primary causes for this state of affairs would seem to be overcrowding on the land.

Congestion. In almost all but the recently established or replanned townships, congestion is a legacy of the increase in population during the first century of the modern period, often aggravated by coerced subdivision during the period of the "Clearances." Because of this, over-all statistics have little meaning. It is quite correct to say there are some 2300 crofts on Skye and approximately 2200 crofters, but this does not mean each family has a croft to itself. To take

[13] Ibid., table 1.

extreme examples, Bornesketaig in Kilmuir consists of 47 crofts held by 35 crofters, but Aird in Sleat has 39 crofters who rent 20 crofts. In one badly subdivided township, Calligary in Sleat, one holding is held in the following shares: four men each have five-twenty-fourths, one has one-sixth, and one has "a part." The whole, indeed, is more than the sum of its parts. Moreover, townships with a balance of crofts and crofters, and even those with fewer crofters than crofts, often show the effects of subdivision. Another Kilmuir township, Herbusta, is laid out in eight holdings. Although there are an equal number of landholders, several of the crofts are divided into half shares. Then, there is Kilvaxter, also a Kilmuir township, with 11 tenants and 12 crofts; one man has three full shares while two others have only half a croft each. Multiple crofts are not necessarily adjacent. Some crofters hold land in two different townships. One of my informants rents two crofts separated by over twenty miles. On foot, it takes him two days to make the trip between his two holdings.

000 Subdivision, frequently carried to its ludicrous extreme, is not a problem confined to the Highlands of Scotland. All over Europe the traditional laws of succession have had a similar result. In consequence, the governments of all European countries have been striving to initiate reform. Generally, the aim has been to consolidate scattered patches, but almost always the schemes have become more comprehensive, attempting to create economic farms and increase productivity. Since the

000 means are not infrequently thwarted by the peasants, the ends are seldom achieved.

As long ago as 1859 Norway began a redistribution of the land; by 1946 42 percent of the infield and 9 percent of the outfield had been regrouped. In Ireland attempts at consolidation date back to 1870. Because the problem was especially intricate, some holdings consisted of twenty or thirty scattered patches, the attempted approach has been comprehensive, including assistance for migration, improvements, and the purchase of farms. Today, even where the consolidated holdings are substandard, they are more productive. I do not mean to imply that the program has been uniformly and sweepingly effective. The study by Arensberg and Kimball is ample evidence to the contrary,[14] but there has been reform. Germany, too, has had an all-inclusive policy since the 1870's. There, whole villages must be replanned. Wherever possible, small holdings have been abolished by moving certain families out to new farmsteads and removing others from the land. It is significant that most of the reform took place under Hitler and, even so, there was universal peasant resistance to land reformation. What effect the partition of Germany has had on these rural villages I do not know. Many of those I visited have twice the population of prewar days. In each country, from Sweden to Italy and from France to Greece, the experiments have resulted in increased agricultural production. On Skye, as in most of the Highlands, the tillage area has fallen at a faster rate than the population. Indeed,

[14] Arensberg and Kimball, Family and Community in Ireland.

where the population has suffered the greatest decline and, therefore, where enlargements, by legal or illegal means, have been the most extensive, crop production has declined the most. Nor has the decline in population, accompanied by land redistribution, altered the fundamental problem.

The cottars (subtenants) have almost disappeared thereby easing the excessive pressure on the land and removing the threat of recurring destitution. Today they are found only in a few scattered dwellings and isolated clusters. Most of them have secured some form of employment or have reached the age when a government pension is sufficient to satisfy their needs. The number of crofters, on the other hand, has increased. If the figures 2043 and 1227 can be accepted as nearly correct for the respective numbers of crofters and cottars in 1886,[15] they have increased at the expense of the latter and, also, the sheep farmer, whom they have replaced.

To briefly summarize the foregoing discussion of the township, let us look at Kilmuir. Table 3 shows the number of crofts and crofters in each of the nine townships together with the acreage and "souming" rights available to each individual. Although replanning during the past fifty years has benefited many of the local residents, crowding upon the land is still apparent.

[15] L. MacDonald, The Past and Present Position of the Skye Crofters, sheets 6, 17.

TABLE 3

CROFTS, CROFTERS, ARABLE ACREAGE, AND SOUMING RIGHTS IN THE KILMUIR TOWNSHIPS

Township	Crofts	Crofters	Arable Acres[a]	Common Grazing	Souming
Bornesketeig	47	35	4	273	2 cows, 1 calf, 12 sheep
Hunglladder	14	9	5	236	2 cows, 1 calf, 10 sheep
Balgown	4	5	13, 14, 34, 46, 66	177	4 cows, 4 calves 26 sheep
Kilvaxter	12	11	27	...b	4 cows, 4 calves 26 sheep
Linicro	19	17	15	729	5 cows, 5 calves 40 sheep 1 horse
Peingown	3	4	18	187	7 cows, 7 calves 20 sheep 1 horse
Herbusta	8	8	12	308	3 cows, 3 calves 26 sheep 1 horse
Totescore	12	13	21	500	3 cows, 3 calves 20 sheep 1 horse
Monkstadt	3	3	27, 27, 5	420	9 cows, 9 calves 40 sheep 2 horses

[a]Arable acres are given in average acres per holding, unless otherwise indicated. Except in Bornesketeig and Hunglladder, arable land includes outrun, improved pasture land individually held.

[b]Shared with Kilvaxter.

Township Government. The township system has another marked influence on the economy of the Sgriathanach. By far the largest obstacle in the path of reform is the persistence of primitive democracy, distinguished from the democracy of Western Civilization by the requirement of unanimous consent rather than majority rule. The individual who comes to realize that it is possible to improve on the ways his father did things is deterred from attempting to introduce innovations. He cannot, for example, erect a fence around his croft unless everyone in his township approves such a departure from tradition. The dissenting voice of one old man is sufficient to thwart any plan. Unanimous decisions on all township affairs mean that the most progressive worker must keep pace with the most conservative. This fact goes a long way in explaining the essential agricultural disharmony of Skye, and most of the Highlands, with the rest of Great Britain. It is also a singular example of the incomplete adaptation of the culture to the higher socio-cultural organization.

When coupled with the many limitations on the economy, township government helps the outsider to understand why many younger crofters feel that the primary value of their few arable acres is their use as pasture. Even in townships which have been fenced, the prevailing practice is to open the crofts after the harvest. All winter long the stock is free to graze where it will. "My arable is no use at all, except to winter my sheep," said one young crofter. Another asserted, "I have three crofts and the use of one more, but it's not

worth while to cultivate any of the arable, so I use it for grazing." A case which aptly illustrates the influence of the township system as an agent of conservatism is the breeding of pigs. Although several old crofters told me how many people during the times of the "Clearances" kept a pig, they are rarely found anywhere in the Highlands today. The Biblical injunction against the flesh of swine has been taken literally. The older people simply have a strong aversion to handling pigs. One man, a very successful cattle and sheep breeder, put it this way: "Pigs are filthy brutes. I just don't want to touch them -- I never have kept any and never will." At the same time, there are men who believe that the prices these animals bring at the mainland markets more than compensate for the individual's revulsion, especially as long as the Ministry of Food pays for the cost of transportation. These men cannot try branching out because they have no way to restrict the foraging animals. "Skye is ideal for pigs," one young fellow told me, "but I don't have the freedom to work the croft to suit myself."

Smaller deviations from the traditional methods of land use face the same difficulties. A progressive crofter who attempts to improve the value of his stock by growing scientific mixtures of grasses is always penalized. As soon as the harvest is over, the stock of all his neighbors will show their appreciation by concentrating on his croft, trampling his fields, and overgrazing his grass. Nor is this his only penalty. His neighbors will regard him with skepticism for his departure from the ways handed down from the past.

from the ways handed down from the past. We might note at this time that even the progressive crofter is not always quite on rapport with modern techniques. There was, for example, a man with two calves infested with liver fluke. Convinced that medicine was the only solution, and equally convinced that a person cannot believe everything he reads, he obtained a bottle of liver fluke medicine which was plainly marked: "for sheep only." When asked how his calves responded to the treatment, he responded, "Och, they both died."

Because of the restrictions which the township system imposes, there has been a growing, perceptible rumble of agitation for supplanting unanimous consent with majority rule. Few, however, would go as far as a retired seaman who returned to Skye after forty years. He would like to see the township system abolished. Another small group believe the Sgriathanach would be better off if the Island were given over to communal farms. Most seem to favor the continuation of the present system. Of course, the majority is composed of the conservative old men.

The Aged and the Absentee Crofter

No appraisal of the crofting system is complete without some discussion of two additional factors which have affected the use of the land and the present unsatisfactory economic condition of the Island. One of the factors is the aged tenant, who, as we have just seen, exercises a strong control over the younger men through township government. He has also influenced

the economy by subjecting many fertile acres to disuse because of his infirmity. The other factor is the absentee tenant, an individual who has obtained possession of a croft, normally by inheritance, but who has failed to take up his inalienable rights of tenancy. Let us very briefly review the economic trends of the last fifty odd years and, then, try to assess the importance of the absent and the aged.

Although the Sgriathanach has refused to become a specialist, fully involved in a money economy, he has become increasingly dependent on the products of the wider commercial society. Long ago he gave up growing the old staples, barley and oats. Not for many years has he grown enough potatoes or turnips to feed himself and his cattle. In place of these home grown subsistence crops, he now imports a great deal of his food. In an average year Skye imports over 700 tons of bread, 10 tons of vegetables, 300 tons of canned goods, 300 tons of potatoes, 500 tons of flour, and 100 tons of milk. To pay for these products, he exports cattle, once his only marketable produce, and an ever increasing number of sheep.

Hance, writing about the Outer Hebrides, sees the growing tendency of the crofters to buy their food as indicative of an increasing cash income.[16] To a certain extent, this may be true. There are, however, additional factors involved. Ecological limitations have played their role. That the climate and soil together make Skye a grassland suitable for stock breeding rather than an island fit for cultivation is an often repeated

[16]Hance, The Outer Hebrides in Relation to Highland Depopulation, p. 62.

436 belief. Since agriculture is a poor risk in the best of years,
241 the present tendency to use more and more of the land for grass
235
439 and hay can be regarded as a more complete adjustment to the environment. The partial involvement in the outside contractual world encouraged and made possible the change. The same reasoning applies to stock production, including the declining number of horses, cattle, and, especially, dairy cows. The exports, obviously, reflect market demands. A couple of
[242] crofters have unsuccessfully tried market gardening. The Sgiathanach is not a vegetable eater, and the commercial establishments, apparently, find a more dependable supply
436 elsewhere. A few crofters do sell potatoes in Portree, but
241 they will not compete with the large, east coast potato
432 farmer. In 1953, as soon as the price fell below the pre-season high, the crofters decided it was not worth the trouble
437 to dig the tubers for sale. The same held true for eggs.
436 Many crofters barter eggs with the food vans which serve the
235 rural areas for tea and meat. When the Scottish market was glutted in the summer of 1953, the crofters refused to trade at lower prices. They preferred to obtain their protein from the eggs, believing that the spring egg prices were the fair prices. For the sake of emphasis, I repeat, the involvement of the Sgiathanach in the world of commerce is only partial. Finally, in accounting for these changing economic trends, the aged and the absentee crofter must be taken into account.

897 The old people frequently cannot work their crofts or
241 cannot use them fully. The age at which the work becomes too

897 arduous is difficult to determine. In the winter of 1953, I
241 helped a small crofter thrash oats, a cooperative enterprise
[228] even with a mechanical thresher, supplied by the Department of Agriculture. The neighbors who came over to lend a hand were two men and three women. The youngest woman would never see fifty again; her seniors were seventy-seven and seventy-eight. The youngest man, who had just been married, was sixty-three; the other seventy-three. These crofters not only showed more endurance than I did, but put me to shame by carrying the sacks of grain from the field to the byre
[162] at the end of the day. Nevertheless, most of those over seventy, about 15 percent of the population, do not make use
897 of the land for more than growing a few potatoes. An old
231 man cannot keep a cow because, as one man said, "You can't
462 have a cow unless you have a woman to milk it." If he is married or lives with a sister, there may be a cow and a couple of sheep. An old woman may have her cow and sheep if she is strong enough. There comes a time, however, when all the old people will only remember the work involved. Still, they will say, "Och, but they were good for all that."

427 Absentee tenants are responsible for depopulation on
241 the one hand and falling production on the other. A reasonable
164 estimate would be 300. Their number could be as high as 400.
[243] Some townships have over 50 percent of the crofters absentee. The only townships which do not have this problem are the few which contain large crofts. On one small estate there are seventy-six crofts, held by seventy-two crofters. Only thirty

427 of the holders reside on their land for more than half the
241 year. The lowest rate of absenteeism is found among the tenants
162 of the Department of Agriculture. There are 76 absentees out of a total of 667 tenants. Most of the non-resident crofters are permanently absent. On the small estate mentioned above thirty-seven of the forty-two absentees have not been seen in years. Five of them usually return to Skye to spend their summer vacation.

427 Thus, we have a situation in which, perhaps, a third
241 of the crofts are held by people who either cannot work them
311 because of old age or infirmity, or do not choose to work
897 them because of greater opportunities elsewhere. What, then, happens to this land? Some of the old people allow a neighbor to use the land. Almost invariably this means the few fertile acres will be used for grass and hay. Absentees "entrust" the
[40] croft, house and land, to a landless family. While Parliament inadvertently gave the crofter a right to keep his holding whether he resided on it or not, it is illegal to sublet. So far, this has not concerned the crofters. Other absentees "entrust" the land to someone in the township who uses it for grass.

427 Turning to the influence of old age and absenteeism on
897 stocking, we find a series of entanglements. If the township is
231 inhabited solely by old people, like Aird in Sleat, the township becomes derelict. More commonly, the absentee and the old person allows someone else to take over his "souming" so
[52] that some crofters have far more than their share. Not infrequently, this gives the crofter a chance to outwit that

427 rich man, the government." Since subsidies depend on the
897 number of stock, he may forget that all or part of his "souming"
231 has been given away. One old crofter, for example, a few years
[24] ago asked a young lady to fill out his agricultural return. She knew his estimates gave a great deal of reason to doubt his veracity, but, preferring not to question the point, she entered his figures. When it came time to sign the report, he was canny. "Och," he said, "just put a tremble in your hand and sign it yourself." There are other crofters who puzzle the authorities by returning the same number of cattle and sheep year after year. Although even the best crofters and farmers lose a few sheep and an occasional cow, they insist
[62] that their stock has produced as many as have been sold. As a means of protecting the government from paying for non-existent stock, the police have to be notified when the annual stock counts are to be made. Even when they do supervise the counting, allowances for stragglers have to be made.

654 So pernicious is the effect of non-residence and decrepit
427 crofts, that a recent government commission has recommended the
897 severance of the house from the land in the case of the aged and the eviction of the absentee, as a means of bolstering the economy and alleviating the widespread condition of bad
427 husbandry.[17] This could be the final blow for the culture. Not
897 uncommonly, the croft is subjected to both absenteeism and the infirmity of old age. The heir does not return until he has passed the age of retirement and begins to think, "It would be

[17] Report of the Commission of Enquiry into Crofting Conditions, pp. 42-43, 46-47, 66.

427 fine to go home to Skye to die." I might add, "and to live on
897 a pension."

427 It is not only the tenant crofters who are non-resident.
[42] About 20 percent of the owner-occupiers in Glendale are non-resident. Only two townships have no derelict crofts. Those who have sublet their homes and land have an additional problem. Apparently unaware of the full implications of the Small Landholders legislation, they have received a rude awakening. The people whom they thought were their subtenants are, in the eyes of the Land Court, crofters entitled to security of tenure.

511 One reason for absenteeism, as for emigration, is a
427 felt need for a higher standard of living than the croft can
[173] provide. This desire, common to almost all European peasants, as well as American farmers, has assumed increasing importance with the extension of communication and education. The outstanding exception in Europe is Italy. There the métayer population has increased markedly since World War I. Today 92 percent in the métayer category have a substandard livelihood, judged in terms of sheer necessity.[18] Only 800,000 families out of 5,000,000 have enough land to meet subsistence needs. The difference between the European peasant and the American farmer is that the American lacks any traditional

[18] Information from the files of the Italian Statistical Institute, as reported in the Glasgow Herald, Feb. 22, 1954.

511 attachment to the land, or his attachment is not strong enough
427 to offset his desire for material rewards.[19] Regionally, a possible exception in the United States is to be found in the Southern Appalachians, where the majority have a net annual income of less than $500.00.[20] These mountaineers, significant are largely of Irish and Scottish derivation.[21] The Skyeman who leaves in his youth returns in his old age, if he can. We may logically ask what opportunities exist on the island for employment which might enable the Sgiathanach to raise his standard of living without forsaking the land.

Fishing

226 Fishing, it will be remembered, was once a traditional
197 and functional activity in the economic cycle of the Sgiathanach but as far as the Skyeman was concerned, it was no more than a supplement to crofting. It was fine to be able to bring home some fish to be smoked or salted for the winter. The wages earned as a hand on an east coast vessel during the summer months were also welcome. Beyond this, he did not care to become involved with the sea as an occupation. His attachment to the land was too strong.

does not mean that there is economic disintegration. Inte-
on does not mean smooth functioning. Perhaps, a further
ssion of cooperation will clarify the situation.

Cooperation

Today it is commonplace to assert that the Sgiathanach, 476
he Highlander in general, is "independent" and "just not 241
rative." Certainly they have come a long way from the 178
hen the old four horse plough made cooperation essential 829
e use of the caschrom made it welcome. Population in-
ity, subdivision of the crofts and the change from a
tence economy to an export economy based on sheep and
could not have left the old pattern of mutual, recipro-
pendence undisturbed. But does this mean they no longer
ate? I think not. In fact, I think critics of the High-
roblem have exaggerated,[9] and the people, always ready to
y the past, have been influenced by stories of an ideal

[9]Cf. F. Fraser Darling and Averil Morley, "The Social
ion," The West Highland Survey, Part VI, p. 2.

ld.

More than one crofter told me that one of the biggest 241 476 178 829
nges on Skye in the last thirty or forty years was that their
ghbors are "less Christian," in the sense of being neighborly
helping each other, than they used to be. Once no one
d, "I've finished my work," until everyone in the township
stacked his grain. "Colin is harvesting today and Murdo to-
row; we'll go over and lend them a hand," was the expected
itude. Toward the end of the season, the whole township
ld be seen working on an old widow's croft. "Now when a
has cleared his land, he says, 'I'm finished,' and that's
t." such a statement has to be followed by asking if they
forget about the sick and the aged. The answer is always
same: "When a person needs help, his neighbors will help
. Perhaps they can't do his corn, but they help by just
ving a few fish by the door or a pail of milk in his cottage."
short, they continue to give mutual aid, but it is anonymous.
Highlander never looks for thanks and never offers it. I [57]
ember our landlady complaining about an Eastcoaster in
tree whom she had helped by giving some outgrown children's
thes. The recipient had thanked her profusely. "You know,
l," she said, "If anyone did that for me, I'd be too choked
to say anything."

Not all use the same colors to paint the scene. I was
o told that the harvest was formerly a time of friendly
alry. The gobhair-bhacaig, two sheaths of oats tied at
ht angles, used to be thrown on the unfinished fields within

Throughout the present century, the commercial importance of fishing, judged on the basis of income, numbers of crofter-fishermen, and boats, has steadily declined. The number of crofter-fishermen has decreased at a faster rate than the decline in population. In recent years its significance as a part-time chore has also been reduced. Wage labor has replaced fishing in the economic pattern. In 1900 there were 1,015 crofter-fishermen with 485 boats.[22] While the number of fishermen rose to 1,039 in 1905, from then until now their number has fallen steadily. In 1953 there were 237 crofter-fishermen with 120 boats. Despite higher prices, the value of fish landed on the island is one-third that of 1900. In 1952 the total contribution of fishing to the local economy was £10,091. This is in marked contrast to the Outer Hebrides where fishing brings in more money than crofting.[23] Fish have, of course, remained essential in the diet. All the crofters have their barrel of salt herring, purchased from mainland curers. Their own fish is usually sold for fish meal.

All who have considered the "Highland Problem" have stressed the need for some form of secondary employment to support the economy. Fishing has enjoyed great popularity as a recommended industry. This is due to the long tradition and the importance of fishing in the Outer Isles.[24] There are several pitfalls in the program as far as Skye is concerned.

[22]"Creek Returns for the Isle of Skye,--1890-1953," Fisheries Division, Scottish Home Department, Edinburgh, Scotland (in the files of the Division).

[23]Hance, op. cit., pp. 81, 89, 134.

[24]Ibid., pp. 89-110.

The factors which brought about centralization of the industry 228
in Scotland, including commercialization, availability of credit, access to markets, and local populations ready to specialize,[25] have also operated locally. The number of West Highland fishermen has actually increased, but the increase occurred at a few centers. Skye, like most of the region,[26] [504] has numerous isolated coves but no harbor adapted for commercial fishing. Further, the changes in the economic pattern have severed the former relatedness and consistency of fishing with pastoral-agriculture. Moreover, fishing today, to be remunerative, has to be diligently followed. It must be a specialized occupation. The Sgiathanach has not been able to make the adjustment necessary to become a full-time fisherman.

Of the 182 townships on Skye, fishing is important in 98.[27] In a few of these townships fish are an export item. [439] There is no longer any fishing done in eighty-four townships. Portree, with its sheltered bay, is the base for a few full-time fishermen who sell locally. Uig Bay, Loch Pooltiel, and [504] Loch Bracadale, all once considered excellent harbors, are neglected. The lack of fishing in Loch Bracadale is striking. It is there that sixty families of Harris crofter-fishermen were settled and purposefully given small crofts with the expectation that they would continue to fish as they had on their native isle. They never tried exploiting the inshore

[25]Collier, The Crofting Problem, pp. 75-83.

[26]Ibid., pp. 78-83.

[27]Darling and Morley, op. cit., pp. 42-45.

228 waters around Skye.

228 I have very briefly reviewed the factors responsible
229 for the present condition of Skye's fisheries. These are unimportant to the people of Skye, many of whom regard the situation dolefully. As far as the crofters are concerned the decline in fishing is due to the following factors: (1) trawlers commit depredations, destroying the spawning beds and fish food in the Minch, poaching the lochs, and sweeping away the gear of the local inshore fishermen; (2) seine netters are just as guilty, especially in depredating shallow waters; (3) there is a lack of harbor facilities; (4) the crofter-fishermen cannot take advantage of the partial grants toward boats and equipment offered by the Herring Industry and White Fishing Industry Boards; (5) the high cost of transportation reduces their profits, especially on lobsters and whelks. The net result is that fishing is dead. As one man put it: "Fishing is as dead as a dodo."

In order to restore the inshore fishing, the crofters advocate, above all, the closing of the Minch to all foreign and British trawlers and seine net fishermen for ten years. Next that "rich man, the government" should provide piers, slips, jetties, and break waters and institute a system of grants and loans for the purchase of boats and gear. Heavy penalties on trawlers who fish illegally, including the confiscation of boats, are also considered desirable. A closed season on lobsters is their final recommendation.

228 In so far as the local white fishing is concerned, there

is no doubt that trawlers and seine netters have swept away 228
lines and gear, particularly earlier in the century. There is evidence that the use of the trawl net has led to more extensive and intensive fishing, causing a depletion of the quantity of marketable fish.[28] On the other hand, there is also conclusive evidence that the seine net and the new, large mesh trawl net allows the smaller fish to escape unharmed. The crofter, who continues to use hand lines, accounts for a negligible share of the catch. This is not a local problem, however. It concerns the entire European continental shelf.

The International Fisheries Convention has prescribed changes in mesh sizes in the interest of conservation, but agreement on the limit of territorial waters is another problem. Unless Great Britain decides to follow the precedent established by Iceland and Norway and extend her present three mile limit, only agreed limitation by the ratifiers of the Convention can reduce the intensity of fishing in the Minch, as in any extra-territorial waters. Fully aware of the advantages which would accrue to inshore fishermen from closing the Minch, the British Government has taken the position that it would be contrary to the best interests of the nation.[29] Such an infringement on the "freedom of the seas" might be followed by adverse effects on her naval, maritime, and fishing interests for other nations might follow

[28] C. M. Younge, Professor of Zoology, University of Glasgow, "International Measures to Limit Overfishing," Glasgow Herald, Feb. 23, 1954.

[29] Glasgow Herald, Dec. 15, 1953 and Jan. 27, 1954.

228 suit.

Apart from this time honored principle and other legal considerations, closure of the Minch will not be feasible until the Hebrideans have a larger catching potential. This potential depends not only on capital for building fleets and facilities, but also on a casting off of conservative attitudes regarding modern innovations and techniques. In short, a fuller adjustment to the demands of the commercial world is required. Additional problems to be faced include efficient handling of this highly perishable item. At present boats from the northern end of Skye have only a limited local market. If they miss the steamer in the morning, they might just as well throw the fish overboard. A consideration of lobster fishing will indicate the nature of these problems.

Lobster fishing is an especially suitable part-time occupation for crofters. Particularly in favor of the industry is the fact that it can be turned to whenever croft work is slack. Then, too, there is a fairly constant demand for lobsters at a high price. In recent years the value of lobsters and whelks, the only other shell fish exported in quantity, has exceeded that of all other fish combined. [434] Lobstering adds substantially to the incomes of the crofters around Broadford and Kyleakin, in the Staffin area of Kilmuir parish, and in the Braes and Portree districts of Portree parish. It was formerly important in Glendale. Indeed, between 1942 and 1949 there were few crofter-fishing townships which did not share in the profits from the sale of lobsters. It should be noted that shell fish are exclusively an export

228 [467] [501] item. No fish without scales is eaten by the Skyeman.

The crofters use small boats, under thirty feet keel, and work in pairs. By contributing creels and sharing the risks as well as the profits, the cost of equipment for each [476] individual is modest. Here, of course, is an additional form of cooperation which has not disappeared. The techniques have remained conservative. The use of small boats restricts operations to sheltered areas, and conservation is not an important consideration.[30] One order, for example, issued by the government prohibited the sale of berried lobsters (females with eggs) without success. The eggs are simply scrubbed off. The law will be useless as long as there are men among them who continue to believe that: "In the old days we took berried lobsters, and the lobsters thrived." Another order has made it illegal to take lobsters under nine inches, the favorite size in the London and Paris markets. This has not only spoiled the market but also is difficult on the crofters because they use small creels. Still, the real trouble is said to be the lack of a closed season. Bretons come over and work the waters during the summer when the Sgiathanach is busy on the land. Crofters from southern Skye are accused of poaching the northern lochs. This leaves few lobsters for the local residents who only go after lobster between November and March.

Although international considerations do not pertain to the question of a closed season, the British government considers

[30] Cf. Darling and Morley, op. cit., pp. 44-45.

the suggestion detrimental to the best interests of the na
economy. There is no doubt that the Skye crofters would
Their peak years, culminating in 1947, coincided with a ti
when the area was restricted for reasons of security durin
Second World War. Additional problems include the loss of
creels during gales and transportation difficulties. It
a day and half for a lobster to reach the London market wh
all connections are made. The high cost of shipment and
high mortality rate reduce the crofters' profits.

The attitude of the government concerning the domest
feasibility of encouraging the local fisheries may be sum
up by the following question by a fishery expert: "Can w
afford to jeopardize the livelihoods of men who devote th
lives to the sea in favor of an industry which may never
develop? There's no official policy yet, but I don't thi
the Board will ever try to revive the industry on Skye."
though they slightly exaggerate the situation, a few stat
ments by Skye men sum up the present condition of this ac
pretty well. On one estate the landlord who has seen fis
die altogether in the last few years, said: "There are no
at all, not even for lobsters. Even young men gave it up
All of a sudden it just died, stopped." A man from Stein
abortive fishing village established by the British Fishe
Society in 1790, has also seen fishing cease, "The few bo
are beached, look at them rotting on the beach." He beli
the decline in fishing is one reason for the continued de
population. Others share his belief. A school teacher s
"Few realize how recent the decline in fishing really is.

Something has to be done to keep the people here." A Glendale crofter put it more forcibly: "There aren't enough men in Glendale to man a row boat. They've lost experience. One crew after the last war lost their boat because they didn't know how to use it. If depopulation isn't stopped, there soon will be no need for any of these remedies." Fishing, then, is one of those subjects which is often discussed and about which little is done. Let us turn to a consideration of the less traditional occupations open to the men of Skye and their womenfolk.

Minor Supplementary Industries

Diatomite. Diatomite, the siliceous remains of minute organisms laid down in fresh water lake beds, is found in quantity in drained Loch Cuithir, near Staffin. After extracting, drying, and pulverizing, during which process it loses 70 percent of its weight, it has innumerable industrial uses, ranging from filters for the manufacture of beer, sugar, fruit juices, and petroleum products, through abrasives, to fillers and insulation material. Attempts to work this large and high quality deposit go back seventy years. To date, however, the success has been indifferent. The omnipresent lack of capital, difficult access through rugged terrain, and technological barriers have been limiting factors. Within the last few years outside investment, about £180,000, with a limited amount of local capital has stimulated the industry once again. A road was built by the government to replace the old tramway, long in disrepair and

finally scrapped for ammunition. Drying sheds have been erected at Staffin. Power machinery for extraction has been brought in; a processing plant has been built at Uig with German equipment; and experienced men have been employed.

The industry is admirably suited to the island. The great weight-losing properties of the raw material, the scarcity value of good deposits, and the large commercial demand combine to offset the high cost of transportation from which most export items suffer. It is estimated by the directors of the company, an English concern, at least that fifty men will eventually be employed in the pit and at the plant. They will be given regular employment, five days a week in three shifts. In addition to building the access road the government, through the Department of Agriculture, has leased the site, and the Inverness County Council has erected subsidized housing at Uig to encourage the venture. When the Secretary of State presided at the opening of the plant in May, 1954, he spoke of the promise the industry held for the Island's future, especially the prospect of regular employment. Up to June, 1954, however, the employment was irregular and limited to sixteen men.

The Skye Tweed Industry. About twenty-five years ago a small weaving and basketry shop was established at Duntulm in Kilmuir. The factor for the Department of Agriculture acted as manager, and the local Church of Scotland minister was the foreman. Later it was taken over by the Highland Home Industries, a cooperative, non-profit corporation.

288 Highland Home Industries is the result of a union in 1914 of two similar movements begun fifty or sixty years ago by several beneficent women to help the crofters find a market for saleable manufactures and reduce their need for dependance on the often [464] exploitive barter system.[31] The Skye workshop has employed eight to ten men and women over the years, plus some who worked at home, but it has never been economic. In 1954 the director, a woman from Edinburgh, was unable to buy material and pay the wages of the four remaining weavers. The old market has disappeared. The shop was unsuccessfully offered for sale in February. Fortunately, a gift from an undisclosed source averted the necessity of closing down.

Only the very old people in Skye can remember when weaving was a household industry. Until the Harris people were settled on Skye at Portnanlong, it must have been a lost art. Today even the Harris folk have given up weaving. They say the purchase tax on luxury, hand woven woolens has destroyed their market. The hand shuttles on one or two looms which are used only move for special orders. The Portree woolen mill, originally established by the Highland Destitution Fund in 1851 and now owned by an east coast corporation, still operates on a limited production schedule. About a dozen village residents are employed regularly, and a few "tinker" girls, daughters of the wandering Highland tinsmiths, find work at the looms.

[31] Alexander Maclehose, The Scotland of Our Sons (London: Alexander Maclehose and Co., 1937), pp. 292-294.

"Scotch". Malt distillation of whisky is a craft rather 279
than an industry. It is carried on at a small plant at Carbost where the most important requirements are satisfied. Located on Loch Harport, the need for access to the sea for the import of raw materials and the export of the finished product is fulfilled. The vast blanket moors of peat provide the smoke so important in the manufacture of Scotch. The abundant rainfall more than satisfies the regular demand for water. The imports include casks and grain. Barley, as mentioned earlier, is no longer grown on Skye, and the required quantity and, in particular, quality of grain could not be grown in the unfavorable environment. The local product, which may be very much the same as the popular, illicit whisky distilled on Skye several centuries ago, has a distinctive body and flavor. Although it is not sold as a straight whisky, it is constantly in demand by blenders and forms the base for Drambuie. The output has been increased four or fivefold in the last fifty years.

Originally built in 1830, probably, on the site of an 464
illicit still, the distillery now employs twenty-five to thirty men. Since the employment is steady, very few of them are even spare-time crofters. The majority live in company houses. There is a period during the summer, when the distillery is out of production because of a shortage of water, but there is plenty of maintenance work for the employees at this time. It is not a supplementary form of employment. Occasionally, local tradesmen and contractors are employed for alterations.

As far as the crofting population is concerned, the benefits 274
are rather negligible. In fact some of the crofters of Carbost township find the presence of the distillery to be a distinct disadvantage because they must keep their "fank" in an inaccessible location well off the drainage slopes which serve the plant. I should add one additional fact. Like all the major commercial [477] ventures on the Island, the distillery is owned by a corporation with offices in Edinburgh.

Forestry. In recent years forestry has come to enjoy wide- 313
spread popularity among critics of the "Highland Problem" as a remedy for the distress, lack of gainful employment, and depopulation of the area. Within the last decade or so [464] forestry has become a source of employment for a small number of men on Skye. The Forestry Commission acquired 9000 acres of land between Glen Brittle and Loch Eynort. Houses were built for employees and nine new families were brought in. Planting has been carried on at a rate which gives regular [464] employment to 12 men, one man to each 120 plantable acres. As the labor required for planting decreases, the men are being shifted to thinning operations. Ultimately, they will begin lumbering. It is anticipated that in time there will [464] be jobs for sixty or more. For every 100 acres there will be one man engaged in planting, thinning, or lumbering and five men or women working in auxiliary employment, such as transportation, mill operations, and services to the anticipated village. The government has been impressed by the success of its experiment. Another large tract, a former sheep farm,

313 just outside of Portree was taken over in 1953, and there are plans for acquiring additional blocks of land.

One reason for the optimism surrounding the potential benefits of forestry to the Highlands is the growth of population which it apparently stimulates. In Glen Brittle the local school, closed for many years, has been reopened. But, as in all migration schemes, the average age tends to be low, and, consequently, procreation is to be expected. Whether or not the potential benefits will be realized remains to be seen. Decidedly in favor of forestry is the stable employment which is offered. Further, a man can be allowed time to carry on crofting not only in his spare time but also full-time when seasonal demands require his full attention. Whether or not there will be enough land left for pastoral-agriculture, near the plantations if he wants to take the time, is another question. Then, too, there are natural limitations to the extension of forests.

313 The difficulties to be faced by forestry on Skye may be 134 briefly summarized. Above all, conditions for tree growth are [32] far from ideal over much of the island. If the soil is fertile enough for trees, as in Glendale and Kilmuir, exposure to the south and west winds may be too severe for a plantation. Shelter belts might be planted, but they have no commercial value and offer only fleeting employment. If there is shelter from the wind, as in Sleat, the soil is either too poor or too boggy for commercial operations. Beyond the areas already acquired and the few small plantations on private estates, the land 313 considered plantable is in limited, isolated patches. At this

313 point cultural considerations enter. The land is often essential to the continued existence of the farm or the crofting township. In Sleat, for example, the land which the Forestry Commission has listed as commercially valuable is the lower, sheltered 313 grazings of several farms and crofting townships. Finally, there 324 is the people's dislike of trees. Many a Sgiathanach in Portree is distressed by the plans to cover Glen Sligihan with a forest. They share the attitude of a man from Soay, a small island a short distance off the west coast of Skye, near Glen Brittle, who was being moved to the Isle of Mull by the Department of Agriculture when Soay was evacuated at the crofters' request. "Och, its all right down there, but you can't see the sky unless you bend over like this," he said bending over double and looking over his shoulder.

464 We have now accounted for, at the most, 120 men and 20 [162] women who work for wages and 238 crofter-fishermen. Excluding the latter, there are over 1000 men and almost 500 women who are employed locally at sometime during the year.[32] With only a few remaining isolated industries, such as the small silica sand quarry at Ord in Sleat and the infrequently used limestone and marble deposits at Broadford in Strath, most of the opportunit for employment have to be in services for women and laboring for men.

462 Let us consider the occupations of women. Over half are 464 employed as resident domestic servants or as help in hotels and restaurants. Ten percent find work in the local shops as clerks.

[32] Information extracted from the files of the Ministry of Labor in Scotland, Portree and Edinburgh.

An equal number, but mainly newcomers to Skye, are teachers 162 and nurses. The remainder are employees of the national and 464 county government, serving as postmistresses and clerks. In addition, an indeterminate number of women, in Portree and in the rural hinterland, but none in Kilmuir or Glendale, add to their income by taking in summer visitors. This practice is not strictly legal for the crofters, in as much as it casts doubt on the agricultural valuation or devaluation, but the county government has not attempted to discourage the practice.

Turning to the men of Skye, we find that the largest employer is the county government, with well over 200 men on the payroll as road workers and general laborers. The national government, directly and indirectly, in recent years has employed another 200 or more men through the Department of Agriculture, as overseers, agricultural workers, and laborers; through the North of Scotland Hydo-electric Board; and in the post offices. If we add the number who work for the nationalized ferry service [657] and the subsidized steamer service, we find that over half of the wage earners on the island depend on the government for their wages. The only other fields open to men are in agriculture, as farm help or township shepherds; in transport, as bus and truck drivers; and in hotels, as barmen, waiters, and porters.

These jobs are by no means permanent or regular. It is 464 not at all unusual to have 300 or 400 unemployed during the winter when road work falls off and the tourist season is ended. They will then draw compensation from the Ministry of Labor, [745] as will the younger men and women who have been working on the

mainland for the summer. For many of these people, unemploy- 464 745 ment is a misnomer. It means they are receiving a weekly allowance from the government while they wait for the next seasonal opportunity to turn from crofting to wage labor. More- 464 657 over, providing work and paying unemployment compensation is 745 by no means all the government does for the Island's economy. Through the National Assistance Program many more are aided financially. In 1954, for example, there were no fewer than 726 individuals receiving some form of national assistance.[33] Most of this number were recipients of a non-contributory old age pension. The next largest category were young women required at home to care for aged and infirm parents. Of the total number, only thirty were Portree residents. Then, too, [654] there are the previously mentioned subsidies and grants for agricultural improvement and fuller exploitation of the land.

We may conclude, then, that cultural continuity is an 182 expensive proposition with a double-edged penalty. On the 167 one hand, there is the sentimental distress which depopulation 657 involves. Both the man who leaves Skye and those he leaves behind feel the loss of their loved ones. On the other hand, there is the expense to the government, which must be staggering and out of all proportion to the amount contributed by the people in taxes. It is not that the islands receive any special grants, but, as one newcomer said, "They just happen to qualify for all the grants, doles, and subsidies there are." He, of course, was exaggerating. As we shall see in the next chapter,

[33] Information extracted from the files of the National Assistance Board in Scotland, Edinburgh.

As we shall see in the next chapter, 178 there is hostility between the Portree dwellers and the crofters. 651 One reason for this is the fact that the village pays more in 657 property tax than the rest of the island put together while they receive relatively little in return. The feeling that the crofter is "aye wantin', but never pays a cooper" (a penny in taxes) is not at all unusual.

Summary

511 If the economic aspect of the culture is judged in terms 182 of the standard of living it affords, it cannot be considered 184 as satisfactory. There are persistent environmental obstacles, 178 among them geographical isolation and an unfavorable climate for pastoral-agriculture. We have seen that few can hope for anything which would approach a desirable income in the surrounding commercial society. The crofters have been caught between two cultural patterns. The old system of land use [17] has persisted. A new system has been superimposed. From this new system, however, the Sgiathanach has accepted few innovations of more recent origin than the eighteenth century, except those of a material or technological nature. Still, he has ceased to be self-sufficient, and, in doing so, he has become dependent on the commercial world for the very essentials of physical existence. For many of the crofters this means seasonal migration in the quest of employment. For some it means part-time or full-time work locally. For a relatively large proportion of the population it means dependence on contributions of their children and government agencies. This dependence has not led to a full

511 adjustment to the higher society in which the successful individu- 182 al is the specialist. The Sgiathanach has remained a pastoral- 184 agriculturalist, and when he does seek employment, it is typically 178 as an unskilled laborer.

It is far easier to point out the traits and trait-complexes he has lost than those which he has accepted during the two hundred years since 1745. The sad economic condition under which he labors is not conclusive evidence for disorganizati Integration does not mean smooth functioning. Nor do the changes, important as they are, point to discontinuity. The contemporary economic system reveals a fundamental continuity. As I remarked at the beginning of this chapter, there is some- [28] thing far deeper involved than economic considerations. Let us now turn to the social aspect of the culture in order to seek an answer to the question why has the Sgiathanach remained in the face of all the inadequacies and insufficiencies we have reviewed.

CHAPTER VI

THE ISLANDERS' SOCIETY

The Units of Social Organization

621 632 571 121 128 Since the Sgiathanach has consistently been more bound to his locality groups than the relatively mobile members of the main stream of Western Society, I think that we shall find a pause to review the character of the social systems which are primarily based on territoriality a valuable aid to our understanding of how cultural continuity has been preserved. By now we are all well aware of the fact that the township is the efficient economic unit. It is also a social entity. The members of each township display a consciousness of common interest, symbolized by the communal hill grazing; and their inter-personal relationships, reflecting ties of kinship and friendship, reveal a rate of interaction second only to those of the crofting family. In most of the townships, the people are related and re-related on both sides 361 by descent and marriage. Laid out along the coast or in a fertile glen, with the cottages on the individual crofts, it has a discernible form. The township is a small cluster of five to twenty homes; approximately an equal number of garden-like farms, stretching out behind the houses; and,

, Inc., 1937), p. 148.

62/57/ calls it, is my township. Nevertheless, since I share Kroeber
feeling toward the free coinage of terminology,[3] I shall not
look for a new word.[4] The neighborhood on Skye is a collectio
of townships which are separated from surrounding clusters by
34/ topographical features. Along the coastal plains and up the
glens stretch the crofts, some parallel to each other, like th
French line village, and others spread out in the checker boar
form of the true British open county neighborhood. Scattered
among the crofts, one finds one or two shops, a few workshops,
and a post office. The focal point for the members is provide
by the church, or a pair of churches, and the school, which
more often than not stand together. There is no other nucleus
of community buildings which even approximate a village center
62/57/ Social factors as well as geographical features play their
role in determining the extent of the neighborhood. It has
been suggested that the upper limit for the size of a group
is determined by the prevalent form of their economy which
limits the possibility of forming close contacts with habitual
attitudes.[5] Although the neighborhoods and the component
townships contained many more people a hundred years ago than
they do today, all are now within the maximal figures suggeste
by Linton and Murdock for agricultural pastoralists, 350 and

[3] Kroeber, Anthropology, p. 261.

[4] I suppose Murdock's "deme" would be an acceptable substitute (op. cit., p. 63). Arensberg has used Einzelhof to describe the Irish pattern (The Irish Countryman, p. 43)

[5] Murdock, op. cit., p. 81; and Ralph Linton, The Study of Man, p. 218.

237

respectively.[6]

Unlike the township, the neighborhood typically has no
al organization and is not necessarily a cooperating,
omic unit. Always, of course, there is a consciousness
common interest. In the case of Glendale this is spiritually
alized by the church and economically, by the large club
in which all the owner-occupiers have a share. In Kilmuir
s are two churches, standing close together, and the crofters
a common economic focus in the drained loch which all use
gual shares for maximized. There is also a crofters' club.
her symbolization of their common interest is provided
raditions, memories of notable personages and events
liar to themselves. Always, the consciousness of common
rest is expressed by a feeling of superiority over the
ers of other neighborhoods.

There is but one kinship-center village on the island,
village of Portree.[7] It is the only true nucleated settle-
. Built on the square, but still retaining the appearance
n overgrown hamlet, it is a small grouping of non-agri-
ural dwellings, government offices, churches, shops, a school,
the homes of those who make their living by serving the
l areas. In addition to its function of providing goods and
vices for surrounding neighborhoods, it also links the
and with the outside world. Although thirty-six miles from
mainland, it is the entry port for the government officials,

[6]Murdock, Loc. cit.; and Linton, Loc. cit.

[7]For a discussion of the importance of the trade-center
lage, see Loomis and Beegle, Rural Social Systems, pp. 188-

238

tourists, and newcomers who carry with them ideas of reform. 621
Further, as well as being mutually dependent commercially, the
crofters and the villagers interact formally and informally
in social, political, and, especially, religious activities.
The consciousness of common interest of the villagers, however, 621
stems more from a knowledge that they are different from the 186
crofters than from any common symbol. The 1000 villagers
are from diverse backgrounds. They find solidarity in being
different rather than in "neighboring" or all attending the
same church. The village also lacks the time depth of the
rural settlements, being a creation of an individual in the
last century.

For community I prefer an inclusive definition on the 631
order of Redfield's. A community is characterized by con-
ventional understandings, the occupation of a territory, and
the possession of a culture. Thus, we shall refer to the
Isle of Skye as the community.

It will be noted that I have not used the term parish. 632
Although the parish was once important politically and religiously, 177
as the older baronies were replaced, it lost these functions
in 1929.[8] People reside within parishes and they, along with
their crops and stock, are enumerated by parishes, but the
parish is now little more than a statistical convenience. Church
organization and political administrative units cross-cut
and override parish boundaries. Indeed, I doubt if the people 148
ever thought of themselves as members of a parish.

Art and Educational Publishers, Ltd., 1947), pp. 113-114, et passim.

239

One further word of caution is in order before we pro- 121
ceed. It will soon become obvious to the reader that my main
interest in the social organization of the Gelathaneh is a
concern with status. In the final analysis, I have decided
that this is the only fruitful means to seek cultural conti-
nuity despite population change. Therefore, I have glossed
over many details of the social organization, and I have
described others only in so far as they throw light on the
ascription and achievement of status. With this in mind, let
us turn to a consideration of the Islanders' society.

Kith and Kin within the Township and on the Croft

The society of the Gelathaneh is no different from any 554
other society in the world in ordering interpersonal relation-
ships by attaching cultural significance to the physical factors
of kinship, age, and sex. As Linton has asserted, kinship
establishes the individual's relation with his cultural recog-
nized relatives; age and sex establish his relationship with
the total society and the section of the culture in which he
can participate.[10] Skye differs from many societies, especially
contemporary American society, by using these factors ex-
clusively for determining the status and role of the members of
the township. The status and role of every individual is
ascribed.[11] The only way an individual can achieve status is

[10]Ralph Linton, "A Neglected Aspect of Social Organization,"
American Journal of Sociology, Vol. XLV, No. 6 (December, 1940),
pp. 870-886; and "Age and Sex Categories," American Sociological
Review, Vol. VII, No. 5 (October, 1942), pp. 589-603.

[11]The theoretical concept, of course, is Linton's (The
Study of Man, pp. 113-131).

240

554 lasting, for if he fails to conform to the traditional norms
and patterns of behavior, he will be looked upon as an eccentric.
This fact has continuity through all periods of Skye's history.

554 We have already seen how the age and sex structure of the
population has changed in response to social and economic
conditions and how this change has influenced the ascription
of statuses within the crofters' division of labor. Briefly,
there has been a contraction of the number of opportunities
for ascribing status. This had made it necessary for some
men to perform tasks once the exclusive domain of women and for
women to participate in activities which formerly were the
responsibility of their men folk. Older people must now
function in ways which once were the responsibilities of the
youth and young adults. These changes, however, have been
accompanied by persistencies, in particular a continuity of
basic status values. I think this will become clear through
a discussion of the family structure. We shall begin with
the nuclear family.

The Nuclear Family. Since my interest is in status, I shall
adopt the unorthodox procedure of considering the nuclear
family in terms of the changing status of the individual members
from birth to maturity. This will give us a dynamic picture
of family life. At birth the individual's relationships with-
in the crofting family and, to a lesser degree, within the
township are established. Like those of his parents, who
now have the ascribed statuses of mother and father, his
relationships will remain unchanged until he marries and founds

241

554 this own family of procreation or ceases to be an integral
554 member of the social units. Many features of these relation-
ships will persist throughout his life.

554 The Gelathaneh treats the event of birth as something
in which man is only the agent of a higher power. This fact
was brought home to me one night during a discussion of the
declining size of families. The question of subsidies to
encourage larger families was broached. Although all take
advantage of government grants for their stock and care of
the land, this form of subsidy was unanimously rejected. As
one man said, this would place man in the unthinkable position
of a creator. Only the essential arrangements for the care
of the mother and her expected child are made before birth.
There are no "showers." "Showers," said one woman, "how can
you tell if the child will be a boy or girl, or even live?"
Today most women go to the maternity hospital at Uig for the
delivery, but a few prefer to remain at home under the care of
their mothers. To expect that the father's mother would take
charge, even under the clan system, would be carrying the
554 patriarchial emphasis too far. Within a few days, the obli-
gations of the parents, their relations, and the people of the
township become apparent. One by one the individuals and
couples make their way to the cottage to welcome the child.
This individual visiting is a modified survival of the old
custom of "kirking," a group offering of thanks, at the church,
for a safe mother and a healthy child, followed by a dance
554 and feast at home. The parents are obliged to provide a
554 dram of whiskey so that all the visitors can toast the child.

242

The visitors each give the child a gift, especially a silver 84
coin. This token of good luck is placed under the child's 554
pillow. The relationships, then, are essentially reciprocal
and individual.

The child's position within the extended family is also 653
fixed at the time of birth by his naming. As a rule, the first 851
son is named after his paternal grandfather, and the first
daughter, after her maternal grandmother. The second son is
given the name of his maternal grandfather, and the second
daughter, that of her paternal grandmother. There are ex-
ceptions to this pattern. One grandmother was adverse to having
her granddaughter named after her, because nowadays, with
late marriage, the naming frequently follows the death of the
individual. By far the most common exceptions occur when
someone in either parent's family of orientation has passed
away. Where the mother's father has died, the first boy is
named after him. The same is true for girls when the father's
mother has passed away. When a brother or sister of either
parent has died, especially politically and religious, the second born is
named "in honor of his memory." In these days of small
families, this has led to giving a girl the equivalent of a
man's name. There was, for example, Augusina who had been
named after her uncle who was killed in the war. Again, with
delayed marriage, the couple may have only one child. So or
she is given the names of both the paternal and maternal
grandparents, such as Ian (for father's father) Duncan (for
mother's father) or Morag (after mother's mother) Flora (after
father's mother). Aside from serving to identify members of

243

alternating generations and being felt as an obligation to 583
perpetuate family names, these various practices serve to
limit confusion among a people who share rather few surnames.
I never knew a child who had been named for his parents.

The relationship of father and child is formally es-
tablished at baptism. As we shall see in the following chapter,
the mother takes little or no part in arranging for the sacra-
ment. The spiritual welfare of the children is the father's 573
concern. He is also the disciplinarian, but in the pre-school
years discipline is lax. Both parents freely indulge the child,
and they spend a great deal of time with him. The belt, an
ever-present, ever-threatened means of punishment, only appears
when the child assumes the rights and duties which he will
exercise as long as he remains on his parents' croft.

When he begins school at five or, in remote townships, 547
at six, the rights and duties determined by age and sex begin 142
to emerge in perspective. Actually, the child has already
begun to make a pretense, playfully imitating his or her father
or mother, at assuming his role, but the influence of the
sex category is not marked. A small boy may fetch water
for the fire or some water for the dishes. Once he starts
school, he is no longer asked to do these chores. As soon
as he is able to carry a pail he may feed the chickens; now
he only feeds the calves. His first real task is tending the
cattle, bringing them down from the hill and driving them out
after the milking. As time goes on, he learns how to plant
and dig potatoes, cut turf, harvest hay and oats, and at least
how to shear sheep.

244

547 A girl also makes an early pretense at assuming her role.
547 While a boy is never seen helping within the home, and, there-
fore, his duties begin later, a small girl soon begins to help
make beds and do the cleaning. If she is an only child, or
has been left behind by her brothers who have left the island,
she is expected to take their place on the croft. In any
event, she will be taught how to milk, how to plant a garden,
and how to help in all other tasks of crofting, except cutting
turn and shearing. She learns at a very early age and in
diverse ways that the primary role of a woman is to serve the
needs of man, some man, throughout her life, unless she is
strong enough to live alone.

Learning the virtues valued by their parents and the
community, as well as the tasks essential to crofting, both
boys and girls are indoctrinated with the ethos of the
Islander long before they can understand the importance of
their object lessons. They are separated by more than the
division of labor of their parents. As we shall see, the
almost unaltered status values of the culture relegate males
and females to two different, but complimentary, spheres of
activity.

As they progress in school, crofting begin to develop,
573 in one way this is inevitable. Until 1953 there was no
attempt to teach the children anything that would directly
relate to the life expected of them on Skye. In particular
there were no agricultural subjects. Even now, there is but
one travelling teacher of agriculture to serve the entire

245

Island. Being taught about the larger world beyond, most 97
195 children begin to show exasperation with the croft and the 15
195 duties it imposes. At first they become reluctant to do their 130
chores after school hours or on holidays, or unable to earn
the strong authority of their fathers, they let the work
grudgingly. This is especially true of those who are planning
to go to a university. While many boys take an interest in
the stock and like to plough, if there is a tractor, they
frequently complain about the slow pace, the boredom of the
long winters, the restrictions on their time, and the weather-
above all, the weather. Girls are no less outspoken. In
particular, the girl who has been left behind by her older
brothers and sisters to care for the parents will feel that
such a life leaves much to be desired. She learns of an-
other, entirely different life in school, and she hears her
siblings tell of this new life when they return for a visit.
Naturally, she begins to think digging potatoes is beneath
her dignity. The most frequently heard complaint is, "You
can't dress out here." The underlying conflict for both boys
and girls in their teens seems to be one between a desire for
adventure or opportunities for individual choice and the
routine, circumspect behavior expected of them.

573 Added to this desire is the realization that they may
573 not really be needed at home. The small crofter with a piece
of land hardly larger than a German laborer's garden can handle
all the necessary chores by himself or, at periods of peak
activity, with the cooperation of his wife and his neighbors.
A medium sized croft may provide work for one, two, or even

[589] [588] [587] [586] [585] [584] [583] [582] [581] [580] [579] [578] [577] [576] [575] [574] [573] [572] [571] [570] [569] [568] [567] [566] [565] [564] [563] [562] [561] [560] [559] [558] [557] [556] [555] [554] [553] [552] [551] [550] [549] [548] [547] [546] [545] [544] [543] [542] [541] [540] [539] [538] [537] [536] [535] [534] [533] [532] [531] [530] [529] [528] [527] [526]

554 New Zealanders breed sheep and make linen. One might say he
626 knew more about the world than about Skye. He could not under-
829 stand why so many people made fun of him when he was only trying to help.

626 In the absence of any traditionally valued status and
632 role of leadership, administration of the common interests of the township members is the concern of all. We say in the last chapter that primitive democracy is the guiding rule. Each crofter has an equal voice in deciding any question which affects the group and all, without exception, have to agree before any action is taken. Consent is expressed by silence. Typically, the crofters will have talked the
[624] matter over among themselves beforehand. At such times the fact clearly emerges that the grazing clerk and the grazing committee are no more than figureheads required by law. They have no coercive or disciplinary powers. In any group situation, their views are taken no more seriously than those of any other man.

887 It is the old men who gather at one anothers' homes or
888 on the hill on a summer evening to weigh the innovation which
626 the youth want introduced. If they find the change acceptable,
632 they approve it at a meeting of the township by keeping silent. If they believe it will upset the communal system, they disapprove it. The dissenting voice of one old crofter is all that is required to maintain the conservative patterns, economically and socially.

182 In summary, we may say that within the township and
626 on the croft the cultural patterns reveal a fundamental continuity. As of old, status is ascribed. Men have remained

182 the social superiors of women. The aged are the social
646 superiors of the youth and young adults. The father determines
545 how his wife and children will behave as long as they remain
187 under his control. The old man, or men, determine what changes
539 will be accepted or rejected. There is no way to question
their decisions, unless one leaves the croft. Still, at the bottom, there is equality. No man can step forward as a leader. We are now in a position to look at the larger social grouping, the neighborhood.

Kith and Kin within the Neighborhood

182 During the days of the clan, the residents of the
641 neighborhood were bound together by real and fictitious ties of consanguinity and affinity, which were reinforced by the strong attachment to the soil and proprietorship. Only
602 the fictitious bonds have been forgotten. Like the township, the neighborhood consists of an aggregate of conjugal families whose inter-personal relationships are reinforced by a
177 complicated network of kinship. Once, perhaps as late as
182 100 years ago, the neighborhood was a highly cooperative
621 social unit. When the local mills were in use and the church had not been broken by schism, the people must have had a more definite focus for their common interests. In more remote times, it was a defensive entity. Today the neighbor-
182 hood is no longer a cooperative unit. On the analogy of the
601 old horse plough and the ceuchrom, cooperation is essential to the township but superfluous to this larger group. That the neighborhoods have not lost the potential for concerted action in times of crisis is attested by the uprisings

during the "Clearances."

Strong in-group feeling is manifested not only in a belief that people of other neighborhoods are not quite as good somehow, but also by the tendency to withhold social acceptance. There is, for example, a family of newcomers in Kilmuir. One day when they were being discussed one old crofter remarked, "Well, whom they have been here as long as Jock over there, they will be just like one of us." It turned out that Jock's family had come to Kilmuir three generations ago. More than once I was reminded of the story of the Yorkshire man who moved from one village to another. He persisted in calling everybody a foreigner, and when asked why, he replied, "I've lived here sixty years, and they still call me a foreigner." The newcomer to Skye is known only by his nationality. The few Polish war refugees are "the Poles." The man from England is "the Englishman" or, in Gaelic, Sassanach, a term also applied to Lowlanders. They have no real place in the scheme of things.

Within the neighborhood, there are invariably established 571
social circles within which the people habitually move. These 602
cliques take several forms on Skye,[16] as in most cultures, and cross cut each other as well as the townships. The most important clique consists of "my people and friends" the individual's kinsmen. The Sgiathanach carefully distinguishes between his "family," his wife and children; his "people,"

[16] Although I consider "clique" to be an unfortunate choice of terms, because it has unfavorable connotations in the lay mind, it has been introduced into the vocabulary of the social sciences; see, e.g., Stewart, Afro Research, pp. 40, 49; Murdock, op. cit., p. 68; Loomis and Beegle, op. cit., p. 135.

571 his parents, brothers, and sisters; and his "friends," his more
602 remote kinsmen.[17]

576 The Extended Family. I regret to say that I am unable to present a complete picture of the functioning of the extended family. In view of what I have already said about instability in the nuclear family, it should not surprise the reader to learn that I could not uncover even the approximation of an extended family. Too many absent relatives thwarted my investigation. I do not, however, regard this omission as a serious handicap. After all, we know almost nothing about the rights and responsibilities of the individual members of the darbhfine during the clan days.

601 The important fact for my study of cultural continuity
602 is that the darbhfine is still a reality in the minds of the people.[18] The fact that the extended family today is as much a four generation group as the darbhfine was brought home to me early in the study by a casual remark by an officer of the Department of Agriculture. "I don't understand these people," he said, "they'll tell you they're not related to someone, and then you find out they're fourth cousins." What this means is the people commonly distinguish only near cousins (first cousins) and cousins (second and third cousins) in English. It always took a great deal of persuasion to get a person to say a "friend" was a distant cousin.

This distinction is drawn even finer in the Gaelic.

[17] Arensberg and Kimball, op. cit., pp. 79-80

[18] Cf. Ibid., pp. 79-90.

601 The general term for third cousins is anns na dubh-chaighean
602 (literally, in the black grandchildship), "in the state of being great-great-grandchildren." When two fourth cousins are found and they are asked what they are to one another, almost invariably the reply is caraid (a friend). Again when working out or checking family structure and terminology, I was always told after getting the term for third cousin, "There's not much point in going any further." It is important to remember that caraid is the usual designation for all relatives beyond the immediate nuclear family.

601 One of the striking facts about the extended family of the Sgiathanach is that the terminology is almost completely descriptive and predominately denotive. It provides a classic example of what Lowie has called bifurcate collateral terminology.[19] In addition to collaterality and bifurcation, the main principles on which the system is ordered are generation and sex.[20] Affinal relatives, excepting the immediate families of the spouses, their "people," are excluded. Only on the second ascending and second descending generations is the sex of person through whom the relationship exists ignored, and only on the second descending generation is sex ignored.

574 In the Gaelic, the members of the group which the
601 Sgiathanach calls his "people" are athair, mhàthair, bràthair, and

[19] Robert H. Lowie, "A Note on Relationship Terminologies," American Anthropologist, Vol. XXX, No. 2 (June, 1928), pp. 265-268.

[20] For a critique of these principles, see Murdock, op. cit., pp. 91-112.

601 piuthar; that is, father, mother, brother, and sister. He
601 calls his father's brothers bràthair athar and his father's 574
sisters piuthar athar. His mother's brothers and sisters are 602
bràthair mhàthar and piuthar mhàthar. Grandparents, as I pointed out, are addressed by classificatory terms. Grandfather is seanair (old father), and grandmother, seanmhair (old mother).

Turning to the more remote relatives, we find that a nephew is mac bràthair or mac peathar. In other words, brother's son or sister's son. Similarly, a niece is nighean bràthar or nighean peathar. The extent to which the descriptive principle is carried is most clearly shown by the terms for cousins. Long ago, I was told, there were classificatory 176
terms for cousins, but they have disappeared. Today when an individual speaks about these collateral relatives, he must employ an ascending order of circumlocution. The general term for first cousins is anns na h-oghaichean (in the state of being grandchildren). Specifically, a first cousin is
601 clann an dà bhràthar (children of the two brothers), clann
an dà pheathar (children of the two sisters), or clann na peathar 's a' bhràthar (children of the sister and brother). Second cousins can be referred to as anns na h-iar-oghaichean (in the state of being great-grandchildren), but again there are denotive terms: oghaichean an dà bhràthar, oghaichean an dà pheathar, and oghaichean na peathar 's a' bhràthar. For third cousins, we have noted that the general term is anns na dubh-oghaichean. Specifically, the terms for third cousins are: iar-oghaichean an dà bhràthar, iar-oghaichean an

601 dà peathar, and iar-chaighean na peathar 's a' bhràthair.

Within the group which the Sgiathanach calls his "family," we find that husband is fear, and wife is bean. Their children are mac and nighean. Marriage, of course, extends the circle of relatives. Both members of the married pair refer to their spouse's "people" as athair-sgìle for father-in-law, mhàthair-sgìle for mother-in-law, bràthair-sgìle for brother-in-law, and piuthar-sgìle for sister-in-law. Sgìle means mate's, in these cases. This leaves us with two classificatory terms which ignore sex. A grandchild is ogha, and a son-in-law or daughter-in-law is cliamhain.[21]

Although this nomenclature is correlated with expected
601 patterns of ideal behavior, in reality, as I have said, the
176 system has broken down under the impact of economic forces.

574 With neo-local residence the township has come to be occupied
by what the Sgiathanach calls "friends" rather than "people."
Not uncommonly, brothers and sisters take up residence after marriage not only in different townships but also in distant
602 neighborhoods. The sharing of work, then, mainly involves
176 cousins. Unlike Ireland,[22] there is no strong taboo against marrying a cousin. Cousins marry "to keep the money in the family," and remote cousins were apparently preferred

[21] Although Arensberg and Kimball look upon the Irish System as essentially similar to that of Northern and Western Europe and the United States, excepting minor variations (op. cit., p.97), I would point out the dissimilarity of the kinship system of the Sgiathanach to that of the United States. The underlying principles are, of course, the same, but the ramifications set the two apart; see, e.g., Talcott Parsons, "The Kinship System of the Contemporary United States," American Anthropologist, Vol. XLV, No. 1 (Jan., 1943), pp.22-38; and David M. Schneider and George C. Homans, "Kinship Terminology and the American Kinship System," American Anthropologist, Vol. LVII, No. 6 (Dec., 1955), pp. 1194-1208.

[22] Arensberg and Kimball, op. cit., pp. 83-86.

605 spouses not too long ago.[23] Perhaps, more than any other
577 factor, it is the tendency of the aged parents to hold on
576 to the croft until they die that is strengthing the kinship
system. Still the extended family is a strong mutual aid
574 group. Anyone with a recognized degree of kinship is
601 entitled to hospitality. When the exiles return to visit
the Misty Isle, they always try to make the rounds of their kinsmen. This is more than a question of not becoming an economic burden on a favorite aunty; they do not want to be guilty of slighting anyone. There is reciprocity here.
240 In return for food and shelter, the visitor freely gives his kinsman all the news he has gathered about the activities of their distant kin. He acts like a roving reporter, cementing the solidarity of an otherwise fragmented group.

602 The expression given to the degree of consanguinity and
764 affinity is revealed most completely at a funeral. As one of the two occasions on which the extended family comes together, the other being a wedding, it reveals a host of significant traits. The first thing I noticed was that although the inavailability of land and the illegality of subdivision enforces neo-local post marital residence, burial is ideally patrilocal. On more than one occasion the steamer came in at night with a body which had been shipped home from Glasgow or
602 Edinburgh for interment in the deceased's neighborhood. This
576 also means that the husband and wife remain integral members of their respective families. The founding of a family of

[23] Norman MacLeod, Reminiscences of a Highland Parish, p. 19

procreation does not absolve the individuals from their obli- 602
gations to their "people." 313

Although the wake and the post-interment feast have been 583
given up under religious censure, and the ministers refuse to 704
consecrate burial, the method of burial is fundamentally the 792
same as it was before the Reformation. At the time of interment
the coffin is carried out of the house by the closest relatives.
Ideally, for a man this means his father walks in front of the
coffin, his oldest son (over fifteen) walks behind, and his
brothers and uncles (paternal) carry the body. For a married
woman the ideal is to have her husband walk in front, her
father behind, and her brothers and uncles carry. When a child [603]
dies, his father walks in front; his oldest brother walks behind,
and the father's brothers for a boy and the mother's brothers
for a girl are the carriers. Outward mobility, as well as
infirmity and death, has had its influence. The nearest male
relative not only walks in front of his deceased kinsman but
also takes charge of the funeral. A few cases of who has filled
this function will indicate how the situation is handled when
the ideal cannot be fulfilled. For a man this role normally
passes first to his oldest son and then to his brother. I have [607]
seen a grandson take charge, and at one very atypical funeral,
a brother-in-law. He was the nearest surviving male relative
who could be contacted in time.

Arrangements for the burial of a widow are made by her
son or brother. There was, however, one widow, a woman from
the Outer Isles, who was returned to her native island for burial

by a second cousin. The striking thing to realize here is that 573
the nearest surviving relative always knows his obligation and 704
is ready to fulfill it, without question. Fatherless children 628
are buried by either their paternal or maternal uncle. I have 848
not forgotten the existence of women. The simple fact is, 562
women play no part as mourners. Indeed, the rare woman who goes
to the grave becomes the subject of lasting gossip.

Fundamentally, the system of kinship is patrilineal.
Linguistically, the terms for relatives may be bilateral, and 411
inheritance of possessions other than the name may be matters 604
of small importance, but the patrilineal emphasis remains. 792
The Sgiathanach lives in a man's world. I shall explore this 128
male dominance further in the following chapter. At present,
I want to briefly discuss two additional cliques.

Religious and Age-Grade Cliques. Like the members of any 573
society, the Sgiathanach associates most frequently with those
who share his interests and attitudes. It is natural, then,
for his associates, other than his kinsmen, to be people who
attend his church and people of his own age group. We need
not explore the nature of these cliques at this time; but
we should have some understanding of their function. The 794
religious clique is primarily a mutual aid group. There is 573
reason to believe that this particular group has lost much 476
of its importance of late, with the coming of the welfare 478
state. Many feel that the government pays people to look
after the aged and infirm. As far as doing a favor for someone
is concerned, few of the same kirk, other than close friends,

offer help without an expectation of payment. Nevertheless, 794
anonymous donations of food and casual visits make sure that 573
none of their number becomes absolutely destitute. In Glendale
this religious clique merges with the person's "people and
friends." Kilmuir has two religious cliques.

We have had ample opportunity to examine the age-grades 561
of Skye's society and in the next chapter we shall have a
closer look at the functions of the age-grades, especially
that of the old men. One of the most important weaknesses 857
of the social structure, in my mind, is the lack of age mates 833
for children and adolescents. They find it difficult, almost 561
impossible, to come together as a sodality. In Kilmuir, for
example, there are only fifteen boys under twenty in an area
of ten square miles. A youth is anyone under forty. Of the
total population 60 percent are over fifty. For this reason [162]
the important age grade clique tends to merge with the re- 561
ligious social circle. The situation is much the same in 794
Glendale. There the age-grade and kinship groups are inter-
twined with the kirk congregation.

Status Equality within the Neighborhood. The fundamental 471
status equality which we found for the crofters within the 534
township carries over to the neighborhood, but, as would be 571
expected, there is often a need for leadership in this larger
group. Let us look at the two neighborhoods which I know best
to cast light on the methods employed in the self-election of
a leader and the means of expressing leadership as a role.
Kilmuir has a Crofters' Club, which was originally formed by 573

a former school teacher. The present sponsor and chairman 573
is his successor. The teacher is automatically rated socially 815
because of his important function, educating the children of a 534
people who value education, and his university background.
Further, he is from the Outer Isles and, therefore, is not
expected to conform to all the traditional norms. Were he a
Sgiathanach he probably would not accept the office for it
would conflict with older and far deeper values.

The Glendale club farm is administered by a committee 573
of five, a secretary, and a chairman. Here all are crofters 241
from the several townships. All, therefore, are equals. Who, 534
then, might they have for a chairman? They have selected an elder 794
of the church. A church elder is the highest lay official in
church government and, on Skye, one of the oldest men in the
neighborhood. As one man asked, "If you can't respect an elder,
who can you respect?"

Selecting members for the committee and electing a secretary 573
is a real problem. Each man serves for three years. How the 241
original committee was formed I do not know, but I had an 534
opportunity to see how vacancies are filled. In 1953 there were
three vacant posts. Parliamentary procedure has been introduced,
but it finds limited expression. For two of the seats, the
retiring members were "re-elected;" a crofter nominated them
and after a long pause another man seconded the nomination. No
vote is taken; silence means unanimous consent. A story slightly
off the point illustrates this. At the same meeting the committee's
stock report was read. Following parliamentary procedure, it

had to be accepted. Not a word was heard. At length one 573
crofter simply said, "No one has anything to say, so I guess we 241
all are agreed." One of the former members of the committee 534
could not be re-elected; he had passed away. This was a thorny
matter. A series of men were proposed, and each in turn de-
clined. Finally, a man was nominated and seconded before he
had a chance to deny himself the honor. Election, of course,
was automatic.

The committee administers the farm, handles stocking, 573
employs the necessary shepherds, sells the stock, and rents 241
the hunting lodge. They do so, however, within the now tra- 656
ditional framework. They have neither been granted nor assumed
a role of independent action. They do not reach independent
decisions. They rather weigh and put into operation decisions
made by the Department of Agriculture. As we shall see, even
the elder, despite his high prestige status, has power to
enforce social conformity rather than the authority to direct
or lead men.

It is significant that while the share-holding crofters 573
own the farm and their crofts, they have not achieved independence 241
from outside control. Many of the Glendale crofters frankly 656
admit they are afraid of independence. As in any township or 829
neighborhood there are two opposing groups. "There always is
someone who tries to sabotage the whole thing," said one man.
One group has favored the guidance of the officers of the De-
partment. The other group resents the interference of the
government in their affairs. At the same time, however, they
do not want to be cast off on their own. They want some form

of farm management under a resident manager, preferably not a 573
Skyeman. The attitude of the former faction was aptly expressed 656
by one person who was about to leave Skye: "We need the Department. 829
If they withdrew, we wouldn't have anybody to go to for anything."
This is in striking contrast to the Irish small farmer for whom
land ownership is an all important factor in regulating social
interaction and status.[24] On Skye land ownership has not led to 728
any change in the traditional status values. A Glendale crofter 560
is not a better man because he owns land.

Prestige Ranking within the Neighborhood. In so far as prestige 534
ranking is concerned, status is more developed within the
neighborhood than within the township. In addition to the
crofters and their families, there are always several individuals
who are given status because of their performance of the necessary
functions of ministering to the peoples' spiritual and physical
needs and educating the children. These are the only achieved
statuses which are valued by the crofters. Noteworthy enough, 793
only the minister of Glendale serves his own "people and friends." 534

The minister's status depends to some degree on his
denomination and the religious sympathies of the people. In
Glendale the minister enjoys the highest possible status. In
Kilmuir, with two ministers, each is valued by his own congregation
with whom he interacts. Nevertheless, all ministers are treated
with respect. They are always addressed as the Reverend Mister
MacDonald or Mister MacDonald. It is interesting to note that

[24]Arensberg, op. cit., pp. 72-100; Arensberg and Kimball, op. cit., pp. 98-144.

793 while only the Church of Scotland ministers will assume roles
534 in government, on the district council or the county council,
on the education committee, and similar bodies, they have
not been given higher status than the ministers of other de-
nominations, who firmly believe the function of the minister
is only to correct the public servants when they err.

The doctor is coming to fill a status held by no other
759 person, except the county people, the landed gentry. Tra-
534 ditionally, they have ranked second only to the minister,
713 but there is a marked trend to accord them more and more status.
The doctors, of course, are less restricted in their social
activities and can participate more fully in secular affairs
than the ministers. They have a wider range of interaction,
entering the homes of all regardless of sectarian differences.
In Glendale there is no question about the relative positions
of the minister and doctor, who lives in Dunvegan. In
Kilmuir on the other hand, the doctor is vying with the
ministers. He is always addressed by his title, but often,
at least in indirect speech, he is Doctor (Ian) rather than
Doctor MacLeod. Many of the doctors on Skye have begun to
form a cleavage between their families and the crofters. They
are sending their sons to private schools. The ministers'
children attend the local schools.

The school teachers also enjoy high prestige status. 815
534 They are always addressed by their surname, prefixed by
576 Mister, even by older men whom they call by their Christian
names. One newcomer was especially struck by this careful

distinction. During the war when Skye had its own little army, he came to know many of the old crofters quite well. Finally, he came to use personal names when speaking to them and asked to be called by his first name. The people explained that they might be older than he, but he was too important to be spoken to as anything other than mister.

The tradesmen and the shopkeepers in Glendale and Kilmuir are not any different from any other man. They are not specialists. They are part-time crofters. We have to turn to Portree to see what status position they fill in the society of Skye. I might just add that they are on a first name basis with their neighbors, and, like the crofters, they are known beyond the neighborhood by their first name and township, such as Ian Borve or Murdo Stein.

To summarize, there is additional evidence for cultural continuity in the structure of the neighborhood. The extended family, although very unstable and, therefore, somewhat amorphous, is still a reality in the minds of the people. It still has two functions which it must have had in the remote past: seeing that all are cared for and given a decent burial. The ascription of status noted for the township carries over to the neighborhood, as does the underlying status equality and need for unanimous consent. Among the crofters leadership is still undeveloped. The old men can enforce conformity but they cannot lead. Although prestige ranking is developed, in the form of the achieved statuses of ministers, doctors, and teachers, it is significant that, except for the minister in Glendale, all holders of prestige status are

newcomers to the neighborhood, if not the island. Let us now turn to Portree to see how important status is in this alien village.

The Trade-Center Village

We come now to a consideration of the trade center village of Portree. We have seen how this small settlement was created by a landlord in the early nineteenth century and how it has been fostered by the government. We have also seen how the village has assumed a host of important functions. Primarily, it exists to serve the rural neighborhoods and to provide a link with the outside world. For the crofting neighborhoods it is, in order of importance, an administrative, economic, religious, and social center. Here are found the Ministry of Labor, the Department of Agriculture, the National Assistance Board, the sanitary and road engineers, the local Registrar, the central police headquarters, the main post office and telephone exchange, the court of the justice of the peace, and the seldom functioning sheriff's court. It is to Portree that the Land Court comes to decide on such important matters as rents and succession to the croft. As a seat of education, Portree's influence extends even wider, for it is the only secondary school in all of the islands of the county of Inverness. For people on the southern end of the island the village exists only for administrative purposes.

The crofters of northern Skye are dependent upon the

The crofters of northern Skye are dependent upon the village for the goods of the shopkeepers and the services of the tradesmen. Several times a week food vans from Portree, or from a national concern with headquarters in Portree, call at the crofts. Twice a week a shopping bus brings the men and women into the village from Glendale, and there is a daily bus service from Kilmuir. For the nearby neighborhoods, the village is of religious importance. If the crofters do not come into the village to go to church, the local ministers go out to serve them. They also send their children to school in Portree. Few of the crofters take an active part in the formal social life of the village, but for all who come in on business there is an opportunity for men to stop by at a pub to have a chat with friends and women to get together in a tea room for a bit of gossip. Then too, for many it is an occasion to visit kinsmen who have left the croft. Nevertheless, despite its functional importance, the village has remained something alien and apart for the crofter. Despite the bonds of friendship and kinship and mutual economic dependence, there is antagonism between the rural dweller and village resident.

Part of the crofter's hostility stems from the religious ethos. On at least one occasion, Portree has been described by a minister as being almost as wicked as Sodom and Gomarrah.[25] In the eyes of the majority of the clergy, the village contains the "synagogues of Satin" from which flow the poisons of

[25] Rees, Life in a Welsh Countryside, pp. 128-129.

immorality. For these reasons, among others, the crofters look down on the villagers. As one man said, "The crofters think we all went to Hell long ago." In part the suspicion and distrust of the villager has grown from the attitude of the villager toward the crofter.

Many of the villagers not only look upon the crofters as narrow minded and bigoted but they resent the presence of the crofters on economic grounds. A few representative statements will indicate their views. "The crofters always have their hand out." "They're aye wantin'. They want water, electricity, roads, and all sorts of things, and they don't pay a copper for them." There is a foundation for these attitudes. The phrase "rich man, the government" has become a common saying on the island. The crofter has become accustomed to having the government pay f o r a large part of the cost of his house, draining his land, and bringing in water and electricity as well as building roads and piers. Many have come to think that there is no end to the obligations of the government. There was one man, for example, whose roof was leaking. Even though the house was his, crofters it will be remembered own their homes, he reported it to his landlord, the Department of Agriculture. Three weeks later, when one of the officers got out to see him, the roof was still leaking. No, he did not see why he should fix it. "Let the government do it." To give another example, in Kilmuir one night there was a discussion about reeds in the grazing land. "We have reeds by the square mile," said one fellow, "the government should

ment sponsors. There is a growing consensus that he is a working man who has to get along as best he can while crofter is coaxed, coddled, cajoled, and pampered with advantageous loans, and subsidies. "Sure there are poo crofters just as there are men who fail in business," s man, "but if we can't make a go of it, we go down the d Another man put it, "The crofter gets paid by the gover for doing nothing--for having a cow on the hill--all I get by sweat, hard bloody sweat." These feelings are e common to the newcomers, but they are by no means held e clusively by this group.

The Social Structure of the Trade-Center Village

121 The village of Portree has a complicated social structure. While I can accept Murdock's contention that social classes operate to unite members of different lo groups and to segment the community, I cannot accept his that the presence of social classes complicates the soci structure of a community.[26] Class status, as any status, determines the pattern of reciprocal behavior. By placi the individual in a group with expected behavior pattern the social structure may be simplified. The individual the group finds security in the cohesion with others who

---

[26]Murdock, op. cit., p. 88

share similar social attitudes and a distinctive way of
life.[27] The investigator can understand the society with
greater ease once he can equate the differing cultural ex-
pressions with the sense of status.

Ascribed status continues to be important in Portree,
at least in stratifying the old Skye families. On the fringes
of the village there are a few part-time crofters or tradesmen
who keep some stock and grow a little grain and few potatoes.
These men and their families as well as the crofters from the
hinterland find their place in the village society through
clique groups, in particular those based upon kinship and
"friendship." Several of the county families reside in the
village and, with the landed gentry who continue to live on
their estates, take an active part in village life.

Between the two poles there is a large intermediate
group. Their occupations range from the professions, in-
cluding doctors, ministers, teachers, and lawyers; through
employees of the national and county governments, including
estate factors, policemen, office managers, and clerks; to
shopkeepers, tradesmen, truck drivers, and laborers. Else-
where in Great Britain these people would fall into the middle
and working classes.[28] On Skye such stratification is un-
important. If we cannot use the British scheme, we certainly
cannot employ the American system developed by Warner.[29]

[28]Cf. Lewis and Maude, The English Middle Classes.

[29]E. Lloyd Warner and Paul S.Lunt, The Social Life of a Modern Community (New Haven: Yale University Press, 1941); and Joe Kitsuse Sprott of Modern Community (New Haven: Yale University Press, 1941).

121 The inapplicability of Warner's scheme within the United States
has been demonstrated by Kroeber,[30] and its use beyond the
504 United States has been censured by Steward.[31] Now, while the
British tend to admit more freely to the existence of class
than Americans do, the social fluidity of the village has
impressed many newcomers who grew up in the Lowlands or England.

If stratification exists,[32] there is general agreement
122 that cleavage or social distance will be found. Murdock,
to cite only one authority, has said the cultural differences
and social distance commonly present between groups separated
spatially are frequently found in socially separated groups.[33]
123 This is certainly true for the landed gentry and the crofters,
but in regards to the intermediate population, Portree seems
to be very much like Sublette, Kansas.[34] The presence of the

545 many newcomers and the high rates of inward, outward, and upward
mobility seems to have worked against any clear cut pattern.
Certainly, it requires more than non-membership in the highest
and lowest classes or socially recognized strata to form a
middle class. I look upon this indefinable strata as a neo-
class. This is not meant to imply the absence of ranking or
prestige status. Ranking is no less important than it is in
the rural neighborhood.

As in the neighborhood, a few professions automatically
162 559 carry high prestige; these are the ministry, medicine, and
163 125 teaching. Otherwise, a man's prestige depends more on his
outside activities than his occupation. Bankers are often
thought of as having prestige. In Portree one banker is
highly regarded because "he does an awful lot for the church."
Another, although respected, as evidenced by the use of his
surname when referring to him, is socially inferior because
"he never mixes with people" and "no one ever gets invited
to his house." The same holds for other occupations. One
man may be looked up to because he has taken an active part
in organizing an old people's welfare committee and was
instrumental in founding the Skye Council of Social Service,
the only rural social service council in Scotland. Another
of the same occupation is looked down upon because he keeps
to himself. To coat a shadow on whatever prestige he may
have, the people talk about a shady deal in which he supposedly
got involved and claim that his wife sells eggs. No one but
a crofter's wife sells eggs. If a man is a native Gràidhagach

162 his occupation matters very little. Unlike the Welsh,[35]
559 the Gràidhagach does not particularly look up to the man
163 who prospers. Indeed, the people are more than likely to
559 attribute his success to dishonesty or find fault with his
character. I shall have more to say about this when we
consider the topic of gossip.

At the same time, occupation is a factor in the
163 formation of cliques. The school teachers form one clique
which has tended to become more and more exclusive in recent
years. The shop keepers also have their small clique.
Once a year they have a dance at the Royal Hotel. Within
both social circles there are, of course, special groups
162 of friends who associate regularly. Age grades provide
another basis for clique formation. Clerks, shop assistants,
and employees of the government are divided on this basis.
Since it is government and, apparently, business and
banking house policy to use the remote rural areas for a
training ground and to make promotions, most of the new-
comers and local residents who work for these agencies are
young men.

621 Neither occupation nor age-grades are exclusive factors
in determining the social structure of Portree as they are
for the crofters. If they were, I could not support the
assertion that there is fluidity among the village population.
578 There are several clubs and fraternal organizations, such
as a drama society, the Women's Rural Institute, An Comunn

---

[35]Rees, op. cit., p. 127.

575 (a Gaelic group), the Masonic Order, the Eastern Star, and
a post of the British Legion, which have representatives
547 from all walks of life. But by far the most interesting
575 group is the village bridge club. If bridge clubs in America
are status conscious, those in Britain are especially aware
of "social" and "cultural" distinctions. In Portree such
547 differences matter very little. Like all of the above
547 mentioned organizations the membership of the bridge club
is predominantly newcomers. It includes members of the gentry,
teachers, shop keepers and shop assistants, office workers,
and a mechanic. Once a week they come together for an
evening of cards and a few drinks. In all formal organizations,
the roles of leadership are left to newcomers or the gentry.
One young man, to give an extreme example, wondered one day
why he spent so much time attending committee meetings. On
reflection, he found that he was an officer in no less than
eleven clubs. It is to the gentry, however, that we must
turn to see the real expression of leadership.

The County Families

565 The landed gentry have been considered separately be-
189 cause they belong to the neighborhood in which they reside;
to the trade-center village, where they spend much of their
time either visiting each other or performing some social
service; and to the community as a whole. Even more than
belonging to Skye, they form a part of the national class
system of Britain. They are the "county families." Next

565 to the aristocracy they are among the foremost citizens of
189 the nation, and two of the local gentry are included among
the nation's peerage. Although I doubt if any of these land
owners can validate a claim to being direct descendants of
the clan chiefs or descendants of the cadets of the clans,
several of them are related in one way or another to the
central darkfigure of the old clans.

Occupying the highest status positions, the county
families manifest many social and cultural expressions which
distinguish them from the remainder of the population. The
men are always (even the distinction of a military title)
they are major, colonel, or general. One man has not seen
565 military service, but he is given a rank anyway. In indirect
189 speech their title often includes their residence or estate,
576 such as Col. Macleod Dalgrave or Mrs. Macleod Dalgrave.
Behind their backs, they may be referred to by their first
name, prefixed by the title, but never in direct speech.
546 Religiously, many tend to be Episcopal sympathizers, in
189 contrast to the staunchly Protestant crofters. The men all
attend the local kirk of the Church of Scotland and serve as
elders of the kirk, but their outlook is quite different
from that of their conservative tenants. One family is
565 Catholic. As would be expected, all are property owners.
189 This is not a question of socio-economic status as much as
576 one of social differentiation. The loss of large parts of
their estates, under the pressure of debt contracted by their
ancestors, has not reduced their prestige.

There must be enough interaction between the rela-
184 565 tively small number of people of similar standing within
the local group and beyond if the consanguineal and affinal
basis of the class is to be maintained, and they are not
562 who lose their identity as a group apart. They must not only
interact with other county families, but the county families
184 must be endogamous. Once a year the county families of Skye
565 are given this needed opportunity to reaffirm their solidarity,
189 to cement their relationship with the upper class of British
society, and to arrange suitable matches for their sons and
daughters. A Skye County Ball is held in November. The
"county people" come from near and far to attend the affair,
one of a series of local balls held throughout the nation.
If anyone has any doubts about his acceptance among the holders
of highest status, he receives his simple but explicit
answer at this time. He must be invited to the ball. For
three days and two nights the festivities continue. High
society has come to Skye and has brought with it its caterers
from Edinburgh. The local people say the "Ha-ya's" have
taken over Portree.

On the first night of the ball, the young people are
escorted from the homes of the Skye aristocracy, who act
as hosts, or the more fashionable hotels to the Skye Gathering
Hall by their parents. During the dance and the supper which
follows, suitable introductions are arranged for their sons
and daughters. On the second night of the ball, the young
people appear in couples. If I were asked to characterize

the ball in a few words, I would say, it is a marriage
565 market.

Social distance and class endogamy can also be demon-
565 strated by a negative approach to the question. Within recent
years there have been a few cases of marriage across the
social cleavage line. The results, as we shall see, show a
strong drive for social exclusiveness. One of the county
184 people married a daughter of the "new rich." Her father was
a crofter's son who made a fortune as a whisky distiller
565 and exporter, especially during the days of prohibition in
the United States. His fortune made, he returned to Skye
and purchased part of the old Clan MacLeod lands. Although
land ownership is a prerequisite for being included among
the upper stratum, neither land nor wealth guarantees
acceptance for a man from the croft. No one received the
marriage of his daughter happily. The villagers and crofters
562 said it was a marriage of necessity. The young aristocrat's
parents' reaction is at least partially reflected by the fact
that it was one of those very rare Skye marriages which end
in divorce. Until his remarriage in 1956, he was the only
divorced man on Skye. In the second case, a crofter married
into a county family. His wife was the daughter of one of
the most prominent ministers of the Church of Scotland in
the present century. Although the minister was himself the
son of a school master, his high prestige status had led to
his acceptance by the "first family of Skye," and his second
marriage was into this family. Some of the crofters and

565 Villagers say he married above his station. His daughter,
566 they believe, married below her station. Be that as it may,
he disowned his daughter. He never spoke to her again. The
thing case involved the marriage of one of the poor, but
nevertheless accepted, gentry and a crofter's daughter. He
has fared differently. Rather than cast him out, his mother
refused to recognize the marriage. He was forbidden to bring
his wife home. To this day he continues to divide his time
between his estate and his "town house," where he keeps his
wife. Further, this man, who I have been told should have
become chief of Clan Ranald, is no longer of the county
people.

Among the distinctive features which overtly characterize
565 the county people is their ascribed status and role of leader-
ship. Indeed, this is their most important function. As
the tacksmen were once the counselors of their subtenants,
so today the landed gentry must fill this role which the
Gaidhanach from the croft will not assume. Even if a Skyeman
here and there feels that the local proprietors would like
nothing better than to have all the people behave like serfs,
bowing and scraping before them, he expects the proprietors
565 to get things done. In Portree the local gentry form the
572 village council. During the war when they were on active
duty, there was no village council. The Skye District Council,
which replaced the old parish councils and which, acting as an
agent for the County Council, is the only administrative
body on the island, revels a similar membership, with only

566 the nine election districts where a member of the gentry is
567 resident, he is the people's choice. Otherwise, the post
568 passes to a newcomer, especially a minister, if he will
accept, a non-crofter of relatively recent arrival, a returned
exile, or an eccentric. The Skye delegates to the County
Council are similarly elected. The village of Portree and
the neighborhood of Glendale are represented by members of
the county people; Kilmuir is represented by a minister of
the Church of Scotland.

The function of the landed gentry emerges even more
565 clearly when non-political leadership is considered. We
may take the Skye Council of Social Service and the old
People's Welfare Committee as examples. The Skye Council of
Social Service is dedicated to the promotion of the "general
good of the community," and the assistance of the work of
statutory authorities and voluntary organizations engaged
in improving education, health, and economic conditions.
Although the Scottish Council of Social Service claims this
is a product of the people of Skye, it was not a spontaneous
development. A retired Registrar General for Scotland was re-
sponsible for the initial interest. The Scottish Council
seems to have stimulated this interest by securing financial
assistance in the initial stages and paying 75 percent of the
annual expenses. The local organizers were county people, and
their success was due in no small way to the efforts of an
officer of the Department of Agriculture. Today the "virile
leadership and local followership," of which the Scottish
Council is wont to speak, is to be found in one clique of the

565 landed gentry. The people take relatively little part in any
569 of the activities. Most of the crofters with whom I spoke
had only the vaguest idea of the work or the achievements of
the council, beyond the fact that the council had instituted
Skye Week to attract tourists.

The Old People's Welfare Committee was established in
the winter of 1953. It provides us with an excellent oppor-
573 tunity to see how things are accomplished on Skye. For several
months the clique which is responsible for the Skye Council
of Social Service had been thinking that Skye needed some
such agency to look after the old people. At length it was
decided a public meeting should be held to give the people an
opportunity to decide whether or not the need was acute.
Each of the county people explained the need, aided by two
social workers from Edinburgh. Then, with the assistance of a
local minister, the doctor, and the officer from the Department
of Agriculture, who aided in establishing the Skye Council,
the people were gently led around to their position. A
committee of investigation was organized to inquire into the
matter in more detail. About a month later a second public
meeting was held for the purpose of establishing a permanent
Old People's Welfare Committee. Like the initial meeting,
it was proceeded by a small conference among the gentry. The
decision was that Skye should have a central committee and
fourteen local committees. This was unanimously accepted.
Now came the problem of who would serve. The first selections
were obvious; in each local area the minister, doctor, and
district nurse were "elected." When it came to the question

565 of individuals to organize each committee, no one was willing
570 to accept the post without persuasion. In every case where
there was a resident of the county people in the general
vicinity, the man or his wife was chosen. The remaining chairs
went to newcomers, especially doctors and teachers or their
wives, mainly by default. They were not present. No one
on Skye ever overtly seeks a role of responsibility. For the
central committee, it was suggested, by a newcomer, that there
should be at least two Skye people over sixty to get the point
of view of the people who were to be helped. When the com-
mittee was finally formed, there was not one native Skye person
on it. The chairman was the wife of a local landlord; the
four members were another proprietor's wife, a Lowland woman,
the minister, and an Austrian woman.

At no time was a vote taken. The person who can be
persuaded to accept office is always unanimously "elected."
On another occasion someone had made the mistake of nominating
623 two women to fill one post. Rather than put the matter to
a vote, the people present "elected" me, as a disinterested
participant, to select the woman who would serve.

By the time I left the Misty Isle only one of the local
committees had taken a step in the direction of organizing
itself. A meeting was called in Waternish where either a
returned exile or the minister was to preside. Neither of
them would step forward. Again the task fell to one of the
county people. She drove up from Portree to take the chair
and help the people elect the members of their committee.
Her journey was fruitless. Hardly anyone attended the meeting,

565 and no one thought himself capable of running a future meeting.
571 At last reports, the wife of another proprietor was having
572 her impression that "it's not as easy as it sounds just to
call a public meeting in Glendale," confounded. While the
majority of the crofters thought Old People's Welfare Com-
mittee was a good idea, they had no intention of being
instrumental in its organization or in assuming any position
which might elevate them above their neighbors. Throughout
this chapter, the stress on conformity has been apparent,
let us now turn to the problem of social control for a clearer
picture of how conformity is enforced and to see how the
Gaidhanach handles the deviant.

Social Control

624 Since social control is an important topic, I want to
go into a further analysis of the manner in which the group
influences the behavior of its members. For the sake of
clarity, we must distinguish between social and political
624 control. By social control I mean the informal pressure or
spontaneous action which any organized group can muster to
exert an influence on its members sufficient to encourage
conformity to tradition patterns of behavior. Political
control, to me, involves the independent or requested inter-
ference of the state, as represented by the police, in any
case which involves the enforcement and maintenance of law
624 and order as prescribed by legal enactments. On Skye the
624 laws of the land do not always have the same meaning to the

671 people as they have for the larger society. This is true
624 in spite of several hundred years of continuous and increasing
contact.

Poaching provides an excellent contrast between the
two forms of control and the differing attitudes of the state
and the Gaidhanach. In Great Britain the tenant of the land
does not automatically have hunting and fishing rights. The
landlords, including the Department of Agriculture, lease them
separately and the county taxes them separately. The crofters,
and many of the villagers, have never fully accepted the
legality of their being barred from the rivers for fish, the
moors for grouse, and the hills for deer. The police enforce
the law to the best of their ability, but they cannot always
count on the support of the local Justices of the peace, much
less the cooperation of the people. Several of the local
Justices of the peace, those who are not landlords, feel that
a man catching a few fish for his own use is not poaching.

If social control were to assume importance with respect
671 to poaching, it should appear in Glendale. When the crofter
671 owner-occupiers are able to rent the hunting lodge and gaming
rights which they received as part of the purchase, they all
share in the rent and benefit by not having to pay both owners'
and occupiers' rates on the property and the gaming rights.
Unfortunately, they have had a great deal of trouble in
finding tenants and even more difficulty in keeping them.
The river and land is all poached. When asked by whom, one
man replied, "Och, who but ourselves would be doing it?" The

624 last tenant apparently decided the whole island was working
671 against him. Unable to catch a single salmon in the Hamara
672 River, an excellent fishing stream, he drove into Portree
to buy one from the local fish shop. After he had purchased
a fine salmon, he asked the shopkeeper where it was from.
Not knowing the gentleman, the fishmonger told him it was
fresh in from the Hamara. Buying his own fish, so to speak,
was too much for him to take.

624 Favorite subjects in discussions of social control,
671 for the lack of it, are pre-marital and extra-marital sexual
relations. One reason for this is, no doubt, the fact that
624 the social control of sex is a universal.[36] In an area such
as Skye where the most powerful institution to which the
Gaidhanach looks for guidance, the church, forbids or condemns
open courting, young people must court in secret. Moreover,
for a people who find marriage all but impossible in their
younger years, secretive courting not infrequently is ac-
companied by illegitimacy. A pattern has evolved on Skye to
handle such mishaps.[37]

848 The child of an unwed mother is "adopted" by the girl's
parents, or, less often, the girl's brother or sister. The
foster parents raise the child as their own. People exercise
great caution in asking about the parentage of a child who
does not seem to be compatible with the age of his mother and

[36] Murdock, op. cit., p. 260.

[37] I have recently found the same pattern in northern
New York, and I suspect that it probably exists in other rural
areas throughout the Western World.

848 father. So well is the situation handled that the child in
many cases does not know of his illegitimacy. We may illustrate
this point with the story of a young lad of fifteen.

An old woman applied to the local office of the Ministry
of Labor on behalf of "her son" for acceptance in an
apprenticeship training course given in Glasgow. The manager
of the exchange, who had recently arrived from the Lowlands,
was suspicious. He pressed her for information until she
admitted the child was her grandson. At a later conference,
the boy was asked if he had any place to stay in Glasgow.
He replied that he could live with his married "sister." In
this case the girl had married someone other than the boy's
father. There is no pattern of carriage in these situations.
Sometimes the unwed mother-to-be marries the child's father
before the child is born. Financial hardship often forces
a postponement of the marriage until the very last minute.
One couple was married on the day of their child's birth.
Other girls never marry. In the latter event gossip appears
as a social sanction. As I mentioned earlier, the native
who has prospered is not always held in high esteem by the
local people. There are several stories on Skye about such
men, especially men in Portree, and their illegitimate
children.

237 Extra-marital relations present a different problem.
Fornication is not characteristic of the Gaidhanach.
When a husband or wife does commit adultery, he or she is
usually a newcomer. Nevertheless, the Islanders feel

strongly about this infringement of the traditional norms. 837
Gossip spreads very rapidly. The offenders are said to be 626
"no better than the tinkers." While tinkers are respected [554] [754]
because they have the power of the evil eye, they are not
accorded any more prestige than we would give a beggar. All
who have any contact with the neighborhood or the village
where the deviants live soon know all the details. Since [369]
most of the adulterers on Skye have been in Portree, it adds
another brick to the wall which separates the rural neighbor-
hoods and the trade-center village. The offenders normally
leave Skye as quickly as possible.

The Sgiathanach cannot be said to have a strong sense 423
of property, or, more correctly, the land is valued as a 421
place of residence and identity not as something to be bought
and sold. We have seen that he uses his land communally and
that he often will not leave a will for the house, not to
mention his land. Even though the state thinks otherwise, he
looks upon the natural resources of the island as his for the
taking. At the same time, he normally respects the fruits of 421
his neighbor's labor. Any one can cut peat on the moor, but [319]
no one, except an unthinking tourist, would take a piece of
turf once it had been cut. In a simlar way, the children are 857
generally well behaved. In the village there is a bit of stone
throwing, a little profanity, and uncommonly some drinking on
the sly, but rarely do children show any disrespect for the
rights of others. One contractor, a Lowlander who came up to
Skye to make alterations on the school, was amazed. Skye

857 was the first place he had ever worked where his men did not
have to lock up their tools at lunch time, and the windows
685 were not broken as fast as they went into the frames. Still
there is some theft.

As might be expected in any area of low per capita
income and seasonal employment, some people succumb to temp-
685 tation. Children, now and then, find the temptation of a
857 candy bar, a shiny pocket knife and other such items which
[431] shopkeepers may have on the counter too strong to resist. The
striking thing is that they always share their loot with
685 their schoolmates. Around New Years, when unemployment is
[273] at its height and a man needs his bottle to see in the New
Year in the traditional way, some men turn to theft. It
never takes the form of house burglarly or armed robbery. As
far as I know, the only case of armed robbery in which a
man from Skye was involved happened on a train in England.
His weapon was a rolling pin. The people at home were very
amused when he said he was taking the rolling pin to his
mother. The usual forms are to take a cow or sheep or to
685 loot a shop. No answer can be given to the question, how
829 much theft is there? The responses vary. "If you stood on
the corner and forgot who you were, they'd have you off in
five minutes, so they would," was one man's opinion. The
police say, "There's quite a bit of it." An old whiskey
smuggler told me, "There's no theft around Portree, but you're
not safe with five pence in your pocket in Skeabost." This
685 obviously is an expression of neighborhood loyalty. How,

then, is theft handled?

The police who are charged with the responsibility of protecting and restoring the property of the local citizens are faced with many difficulties. To begin with, the local people will not always complain to them. Even if the help of the police is sought, the person seeking it will not tell who might have committeed the crime. Even if he knows who is guilty, he will not tell. The police must build their case with care. If the facts are clear and straightforward, the defender invariably confesses. One reason for this is the fact that a confession means a local trial by a justice of the peace rather than one before a sheriff. The defendant can hope for sympathy, and he rests secure in his knowledge that his sentence will be lighter because of statutory limitations. If witnesses are required, the police must almost put words in their mouths, and they are never free from the possibility that a witness may change his story when he is put on oath. One policeman said, "They hold their church services up there," pointing to the court room, which was being used by one sect while their church was being repaired, "on the Sabbath from 10:30 until 2:00 and they're back again at 6:30, but they tell the damnedest lies in the same room."

We are dealing with a dichotomy like that we noted in the case of poaching. As far as I was able to determine, those cases which come to court involve activities which do not affect the norms of the group. There was for example, a girl in Portree who stole the equivalent of some five or six thousand dollars in cash and material over a period of two

years from her employer, an outside concern. She spent the money on clothes and holidays in London, and gave the material to her friends. She was brought to trial and given a sentence of six months. Upon her return, she was welcomed with open arms. The sympathy of the people was with her rather than with the organization with its main office in far off Edinburgh. As they said, "Poor Jane, she was a good girl." "Poor Jane" died not long after being released.

When traditional norms are involved the situation is handled quite differently. There was another young girl in the village who was guilty of a similar petty crime, on a smaller scale. During the last war, one of the local ministers organized a group of girls from the school hostel to make a door to door collection for a charity. One of the girls, a "foster child," had never been given any spending money. The temptation was too great. She spent her collection. To replace the money, she stole from a fellow hosteler. When she was found out, she was expelled from the hostel. The school year had two remaining weeks, at the end of which she was to graduate. Not one Sgiathanach, including her "people" and "friends" of her relatives, would have anything to do with her. As far as they were concerned she had exiled herself. She was an outcast.

Now let us turn to the crofting neighborhood to see how a crime is handled there. In most cases the neighborhood, as the fundamental locus of social control,[38] is able to deal with

[38] Cf. Murdock, op. cit., p. 84.

deviants without reccurse to the court. Indeed in Kilmui they do so well that I never heard of any theft. Still, has been some theft in Glendale. Shortly before each ca sale the shepherds on the club farm found one or two catt had disappeared. At first they thought the cattle might have gone over the cliff, but coincidence soon indicated had a thief in their midst. One of the crofters, a retir Glasgow policeman, took a hand in discovering the guilty At length he found out who it was. At the annual meetin several weeks later, he stood up and told the shareholder exactly what he had seen. Here were the facts, in detail He did not, however, name the guilty person. After he ha finished, the crofters calmly asked him to retell several parts of his story, and then there was a period of silenc Finally, the man publicly confessed and expressed repenta He was not cast out or handed over to the police — I dou the police know of this even now. His humiliation was sufficient punishment.

Among such crimes and the forms of social control w they prompt, however, murder is almost unknown, deterred the tales which tell of being plagued by the man's ghost the grave, and suicide is extremely rare, with only three in many, many years. Much more important, however, is the influence of social control over public behavior.

During my stay on Skye, I was struck by the lack of aggression. Aggression was an outstanding characteristic culture during the days of the clan, as the Crown ruefully

iscovered on many occasions. I once entertained the thought hat its absence was indicative of a decadent culture. Then discovered that it was a traditional norm of behavior. Only nce during the modern period has there been any aggressive ehavior, during the closing years of the "Clearances." Some ho remember these "old warriors" who were not afraid to stand p for their rights wonder why their descendents have changed. oday only the ministers are aggressive in their dealing with heir congregations, and they reserve their aggressive pose or their Sunday sermons. Naturally, the people quarrel among herselves and a couple of drunken men may come to blows with ach other or the policeman who interferes. In any group ituation or in any dealings with outsiders, however, dislike r resentment takes the form of placid resistance. The Islander emains courteous and suffers in silence. This is "affect upression," resultant from Protestantizing the crofters.[39] ven the talkative individual, unless he stands among the gentry r has achieved prestige status through his profession, is onsidered an eccentric. He must stand the snickers of the roup and bear the title of a "worthy," a man who does not act is age.

Real anger, manifested by a loud or quavering voice, or able pounding, clenching one's fist or other recognizable signs, s not characteristic of the Sgiathanach in public. The man who orgets himself is always taken in hand by the minister, an old an, or a teacher. He may feel righteous indignation, but if he

[39] I am indebted to Conrad Arensberg for calling my ttention to this fact.

becomes too worked up, he is expected to withdraw. On occasions, 152
such as weddings, when all have had their share of the uisge 156
beatha (water of life), there may be heated quarrels, including 626
the raking over of old clan feuds. Again, some older man will take the offender in hand, "It's not you that's talking, Murdo, it's the drink." The man almost invariably expresses regret for his outbreak later. Political meetings, often explosive situations in a democratic country, may involve some heated debate, but the code of diquette is never breached. When one politician told the Kilmuir crofters that something should be done to stop depopulation because soon they might not have any young men for the army, the people were indignant, but they remained quiet. In the case of the cattle thief, cited above, no one lost his temper. In fact, the matter was discussed almost in a monotone.

People still talk about the one outstanding example of aggression which has occurred recently in Portree. At the end of World War II, a collection was made for the benefit of the returning servicemen. A public meeting was held to discuss what would be done with the money and who was eligible to receive a gift. Two young men, both of whom had spent several years in a German prison, and had been drinking, became boisterous. They accused the committee of spending the money and trying to cover it up. The chairman left the meeting. His replacement, a newcomer, restored order by threatening to call a policeman, something which never had been suggested at a public meeting. The boys were forgiven because they had been

German prisoners and must have had a terrible experience, and 152
anyone knows the uisge beatha brings back memories. 156
626

Gossip

Social control does not always take such dramatic forms 626
as those we have been considering. Infringement of the traditional norms is deterred, and deviation from the expected patterns of behavior are censured, by a more informal technique, namely gossip. It is not an exaggeration to say that everyone within each neighborhood knows his neighbors intimately. They know the individual, his family, and his ancestral stock. They are aware of his activities inside and outside his cottage, the way in which he meets his moral and religious obligations, and his general outlook on the world. The villagers are equally aware of the character and behavior of one another. Further, almost all the crofters who have dealings in the village know and are known by the villagers, at least by reputation. If any individual is not known, personally, it is relatively easy for a person to find out all he wants to know from another villager. To remain a mystery is dangerous; it begets resentment. Any new arrival to the island, other than a tourist during the summer, soon becomes known in the local area. If he is an important person, his arrival and departure are heralded across the island.

Gossip has enough emotional force on Skye to deter deviations by the native and to mold the newcomer's behavior to no small degree. It has been known to make people so

miserable they have left the island. Adultery, as we have 626
seen, is an excellent illustration. Another example is church going. Almost everyone goes to church. It is expected. Several newcomers frankly admitted that they only go because the people would talk about them.

Gossip has another important social function. It is a 626
means of social sanction, and as such reinforces the "unconscious 182
system of meanings" to use Herskovits' words.[40] Through its positive and negative aspects, the use of gossip as a social sanction contributes to the solidarity of the group by creating a feeling of oneness. It can also accord status to individuals, and it can either make an individual with high status more secure in his belief of superiority or make a person of low status feel less inferior.

The crofters relish stories of human failings among 559
those of high status. The landed gentry seldom give them 626
much to talk about, but the few unexpected things they do, such as marrying outside their circle, are long remembered. The villagers often provide them with choice stories. Anyone, especially a native son, who moves into Portree or returns to Portree and sets up a business is bound to be talked about. "Do you know what I heard? Well, I heard that he got his money down south and just beat the police out of town." Men who have shops which their fathers or grandfathers established escape, but the founder of the business is still remembered. "You know where the old man got his money? He was going home one night after a cattle sale with a group of

[40] Herskovits, Man and His Works, p. 222.

his neighbors, and he done them in and took all their money." 559
626
The villagers and, in particular, the county people 369
enjoy amusing stories about the crofters. One tale concerns a crofter who received electricity from the Hydro-Electric Board. After the cottage had been wired, his wife bought him an electric razor. This created a problem. If he plugged the razor into the single light socket, he could not see to shave on a winter morning, but if he had the light on he could not plug in the razor. There are many stories about crofters who refused electricity because they were afraid the house might blow up if hit by lightning, and there is the favorite story of the old woman, on the Isle of Lewis, who thought electricity was fine to see to light her candle.

To see how gossip, bordering on tradition, is indicative 522
of high-prestige status, we may take the story of the doctor of Kilmuir. One day just after a cattle sale the doctor took the boat from Portree to Kyle. In addition to several local people and many cattle, there were two Sassannachs on board. The Englishmen asked the doctor how many cattle there were. He thought there were quite a few. A hundred, the Englishmen asked. "Sure," said the doctor. Two hundred, they asked. The doctor again said, "Sure." They then inquired whether or not the doctor could count. When he answered in the affirmative, they asked how many they and the doctor were. He replied, "One hundred, I am one and you two are nothings." The core of these stories always involves the doctor's getting the better of someone, especially an Englishman. It may be

added that the stories are frequently heard elsewhere in 522
the Highlands. This particular tale is also told in the Outer Isles, where the central figure is a famous drover, drovers still being important in the Outer Island cattle trade.

Stories about well-lized doctors getting the best of ministers are also told by members of the Church of Scotland. There is, for example, the tale about the doctor who went to the service of one of the seceder ministers. The sermon was on the immoral dress of women. After church the minister asked the doctor how he liked the service. Holding up his Bible, the doctor replied, "I enjoyed it fine, but I brought the wrong book. I should have had one of those mail order catalogues."

We should not, of course, overlook the fact that gossip 203
is the main form of communication on Skye. There are few aspects of life which do not interest the people enough to become matters of gossip. How, then, does gossip travel? All are carriers of gossip, but several occupational groups are primary carriers, especially the food van drivers, bus drivers and tradesmen. Perhaps, it is a widespread phenomenon that the gossip spreader does not know his role. One day a tradesman returned from the far end of the island. Following the pattern, he was asked "what's fresh?" and replied "nothing" and then proceeded to give the news he had picked up. After he had finished, he paused and said, "you'd wonder where those people get all the news."

In its less emotional aspect, gossip has been formalized 204
by one agency, the Skye Clarion, a local monthly newspaper.

Founded in 1951 as a single sheet of 200 words it has grown 204
to sixteen pages. It has the distinction of being the only news magazine in Great Britain written in longhand. The 203
shopkeepers also pass along the local ken, as it is called. There is a common belief that the telephone operators are another source. I have known people to drive several miles to make a call from a box in another exchange district because they were sure the people of their neighborhood would have the news before they had hung up the receiver, if they made the call locally. The post office is also said to be a transmitter [829] [205]
in the bush telegraph; some say the post mistresses steam open their letters. On shopping days in Portree the women carry home more than the week's groceries. Down at the square at night, they gather in small groups to transmit their tantalizing tidbits of news and, perhaps, scandal.

Two status groups are left out of the normal gossip 203
cycle. These are the county people and the ministers. The 551
former may get a bit of ken from time to time, but much of the 715
local news passes without reaching them. The ministers' information is generally limited to questions of health, events in the life cycle, or cases of moral or religious backsliding on the part of their congregations. The degree to which the landed gentry participates in the verbal spread of news and rumor depends to a great extent on personal qualifications. There are one or two who have contacts through whom gossip carries across the lines of cleavage in the social hierarchy. Ministers are probably the least well informed of anybody on the happenings of everyday life. Once when asking a minister

a question about a certain man I was told: "I can't help you 203
on that. Whenever I go into a shop or meet them on the street, 551
they change their conversation." Another told me I should ask 715
the doctor, "He's the one who really knows their problems."

Summary

The society of the Sgiathanach reveals additional evidence 182
for cultural continuity. In family structure, both nuclear 576
and extended, the patrilineal emphasis has been preserved. Even though both suffer from chronic instability and the extended family has become rather amorphous, kinship remains an important regulator of interpersonal relationships. It involves obligations and privileges which few take lightly. Within the 182
social units based on territory, the township and neighborhood 621
status continues to be ascribed on the basis of age, sex, 554
and kinship. Women have remained socially inferior to the men. As the father controls his family, the old men of the township and neighborhood exercise a power over their juniors to force conformity to traditional ways. Fundamentally, all of the same age and sex are equals. This status equality underlies the entire social structure. There is no room for a leader. When essential, the newcomer, normally the teacher or minister, and the landed gentry are expected to assume the role of leadership. In the village the emphasis on ascribed status for the Sgiathanach is also important. The majority of achieved statuses are left to be filled by newcomers. In the community, as a whole, beyond the polarity of the landed gentry and the

crofters, an individual's prestige depends more on what he 182
does for the group than on occupation. 621
554

The society has a strong degree of integration. This 182
is shown by the requirement of unanimous consent on all under- 621
takings, even in the village, and by the continued success 626
of the group in exercising social control by positive concerted action and by employing gossip as a negative social sanction. The norms of behavior and the values have remained common and clear.

We are now closer to an understanding of how the 128
Sgiathanach has maintained a continuity. For a full understanding of the social organization and to answer the question why there has been continuity we must take one final step. The religious aspect of the culture holds the key to the unanswered questions.

CHAPTER VII

THE ISLANDERS' RELIGION

Synopsis

The strength and vitality of religion on the Isle of 771
Skye, and all along the West Coast of Scotland, has been an 182
outstanding characteristic of the culture for well over a century. It is no less distinctive of the culture today than the crofting system and the socio-economic way of life which crofting embodies. Moreover, the religious patterns not only reflect a continuity of culture in themselves, but the religious aspect has provided the means by which the culture, as an integrated whole, has been able to maintain a genuine continuity. Here on the very fringe [795]
of Western Europe in one of the few remaining outposts of the Gael, Calvinism, as interpreted by John Knox and Andrew Melville, as refined by the Scottish Covenanters, and as modified by the influence of the English Puritans in the sixteenth and seventeenth centuries, stands as one of the few examples of marginal intensity in Western Civilization.

Until the nineteenth century religion was an indomitable acculturating influence. A new code of ethics, morals, and behavior was superimposed on the old. As the influence of the traditional leaders declined, the scope of the

307

The religion of the Sgiathanach may also be regarded as 771
the logical outcome of a movement which began two centuries 182
ago when the all inclusive bonds of kinship and affection were 176
replaced with tenets introduced from the wider contractual society. This movement, as we know, bore its first fruits over a hundred years ago. The people themselves turned from 793
the ministers who were supporting symbols and values no longer meaningful to the crofters. They embraced the preachers of a 793
dynamic gospel as a means of consolation in their distress. Thus, the religious pattern derived elsewhere and superimposed 184
on the Sgiathanach has been refined with logic and vigor. 771
It has become the one insurmountable barrier to assimilation 182
with Great Britain. No less than four times religious schism 798
has demonstrated the essential unchangeableness of their religion. The process has been carried on with such dedication and success that it now disturbs the unsympathetic laity and the clergy of the Church of Scotland no less than the resistance of the people to Presbyterianism did in the remote past.

We saw in Chapter IV how an understanding of the re- 128
ligious history of Skye is indispensible for the comprehension 121
of the larger problem, the means by which the culture has maintained continuity. In Chapter V and again in Chapter VI we saw how this continuity has been preserved. We have at last come to the point at which we can ask why has there been continuity. The following analysis is concerned with the sanctions of the Presbyterian ethic, particularly as it affects the social structure, religious behavior, and the roles of the ministers and the religious laity in the

308

contemporary scene. Assuming that few of my readers know any 128
more about the nature of the religion of the Sgiathanach than 121
I did when my wife and I first set foot on Skye, I shall begin with a brief description of formal organization and theology.

Formal Organization and Theology

The Isle of Skye now has four independent Presbyterian 795
Churches, the Church of Scotland which is the official state church, the Free Church of Scotland, The Free Presbyterian Church, and the United Free Church. There are, in addition, a few Catholics, including the one family of the county people who worship by themselves and several government employees in Portree who meet together and hold services in a private chapel. There is also a fairly large number of Episcopals, consisting exclusively of county families and newcomers, who periodically receive a visit from a minister in Fort William but who otherwise attend the services held in the Church of Scotland.

The Presbyterian Churches differ from one another 779
in several fundamental details of their constitution, doctrine, 795
creed, and practice. All claim to be in historic continuity with the Church of Scotland which was reformed in 1560, the liberties of which were ratified in 1592 by the Scottish Parliament, and the security of which was recognized in the Treaty of 1707. All, except the United Free Church, hold to the principle of national recognition of religion,

309

commonly referred to as the "Establishment." The main differ- 779
ence is the the Free Church and the Free Presbyterian Church 795
have rejected all Declaratory Acts which have interpreted the meaning of the Westminister Confession of Faith.

The Shorter Catechism, written in 1611, contains the basic religious tenets of all the Scottish churches. Since children are required to have a knowledge of the catechism by the age of eight, if only by rote, and a knowledge of the tenets is indispensible for the baptism of one's children and acceptance as a member of the church, we should be acquainted with them if we are to understand the religion.

Man's chief end is to glorify God and enjoy him eternally. To achieve this, the directions given in the Old and New Testaments must be accepted as the infallible prescribed means for reproof, enlightenment, correction and instruction in righteousness.

"Foreordination" and "Effectual Calling" are the two guiding principles. God foreordained all that has come to pass. He preserves and governs His creatures, created in His own image, and their actions, but, on condition of perfect obedience, they have been granted freedom of will, by which they have sinned and fallen from their original state of grace. All mankind through the original sin lost communion with God and are under His wrath and curse. They are subjected to all the miseries of life and damnation.

Christ, the Redeemer, revealed the will of God for man's salvation. Everlasting life, a covenant of grace,

310

deliverance from sin and worldly misery and entrance into a 779
state of salvation were again offered to man. To become 795
partakers of redemption, the Holy Spirit must work faith in man, uniting him to Christ in "Effectual Calling" which convinces him of his sin and misery, enlightens his mind, and renews his will. He who is "effectually called" partakes of justification, adoption, sanctification, and all their benefits. By justification man's sin is pardoned. By adoption man is received into the "elect" and has a right to all the privileges of Christ. By sanctification man is renewed after the image of God.

Man's duty is obedience to the revealed will of God as given in the Ten Commandments. No mere man, however, can keep them perfectly in word, thought, and deed. Every sin deserves the wrath and curse of God which can only be escaped by faith in Christ, repentence, and diligent use of the ordinances, especially the Word, sacraments, and prayer. These are made effective for salvation to the "elect" (and only the "elect"). The reading and, especially, the preaching of the Word is the effectual means of convincing and converting sinners. The sacraments of Baptism and Communion sensibly represent, seal, and apply the signs of Christ and the new covenant.

Baptism is administered to those within the visible church and their infants. The Lord's Supper is to be received only by the worthy, those who find up self-examination that they are worthy in their faith, repentance, love, and new obedience.

311

All the churches on Skye are organized in identical 795
fashion on the local or parish level of church administration. 793
According to the democratic principles outlined in the Bible 794
and the Books of Discipline (1561 and 1578), the congregation alone decides who will serve as their spiritual leaders. It will be remembered that patronage was one of the causes for the church schism of 1843. The members call their minister and elect the elders, deacons, and in several churches, a precentor. The elders are the very pinnacle of the lay 795
religious hierarchy. They are chosen from the "elect" to 794
act as the guardians of the moral and religious behavior of the congregation and to lead the congregation in worship on certain occasions which we shall meet with later. The deacons are similarly chosen from the "elect" to look after the financial affairs of the kirk. The precentor is a chanter. He gives out the psalms the people sing line by line. No matter what the official position of the church, expressed by the General Assembly, Synod, or Presbytery--the higher religious courts--the local kirk session composed of the minister and his elders retains decisive power.

Erring members of the congregation are called before these guardians of the people's behavior for judgment and discipline. For the protection of the congregation, the 795
Presbytery, composed of the minister and a selected elder 794
from each church, examines and installs newly called ministers 793
and has the power to censure any minister guilty of a spiritual or moral transgression or infringement of his duty to the

congregation. The Synod and, in the case of the Church of 795
Scotland and the Free Church, the General Assembly do not 794
normally interfere in local administration. They can be called upon to enforce the decisions of the Presbytery, but they are primarily deliberative assemblies which meet once a year in Edinburgh to discuss over-all church policy. Again, as we have seen, attempts of these higher bodies to impose their will on the local kirks have led to schism. Thus, since the fundamental sest of control is vested in the kirk session, in the neighborhood, the interpretations reflected in the higher religious courts do not necessarily find expression in the patterns of religious behavior on Skye. Indeed, the Church of Scotland on Skye is more like the other sects than it is like its parent body elsewhere in Scotland, where it has gradually moved toward a position similar to the Anglican Church or the Presbyterian churches of the United States. To the uninvolved observer, the differences are insignificant compared to the essential similarities of the local churches.

The Role of Religion on Skye

Because of the hold of the ramifications of religion 121
on man, in particular, man as a member of a folk, peasant, or predominantly rural community, religion tends to have a permeating influence on all significant phases of life.[4]

[4]Cf., e.g., Robert Lowie, Social Organization (New York: Rhinehart and Co., 1948), pp. 191-192; T. Lynn Smith, The Sociology of Rural Life (New York: Harper & Bros., 1947), p. 423; and Kroeber, Anthropology, pp. 282,284.

121 Functioning in diverse ways, religion reinforces standards of behavior. As a supraSocial and cultural regulator of social life, it sanctions the way of life of a group and its basic social forces.[5] While the great world conscious religions have been influential in redirecting whole civilizations, their success has been largely due to an ability to function in harmony with local cultural conditions. The symbols and values they extend must be meaningful to the people.
121 Failure to protect certain values brought about the rejection
178 of Catholicism and the acceptance of Calvinism in Scotland.[6]
795 Continued sanctification of values no longer meaningful to the Sgiathanach cost the Church of Scotland its hold over
121 the people. The influence of religion, especially once it has ceased to work for change and has become conservative, as all organized religions are wont to do,[7] is expressed in terms of what particular traits it singles out for sanctioning and, conversely, what traits it refuses to sanction or places under taboo. Obviously, this is but a part of the primary function of religion, its role in bolstering group solidarity.[8]

[5]Cf., e.g., Kroeber, loc. cit.; and MacIver, Society, p. 120.

794 Prerequisite to an understanding of the role of religion
779 in ordering human relationships for the Sgiathanach is an awareness of a distinctive and all-pervading feature of church membership. When we briefly discussed theology, we noted the prominence of the principles of "Foreordination" and "Effectual Calling." While many Scots may pay them lip service, the Skyemen firmly believe in them. Because of their unfaltering belief and the strict interpretation of "Effectual Calling,"
787 the membership of all churches is very limited. Admission
828 to the numbers of the "elect," those who have received a visitation from the Holy Spirit and experienced a soul-saving change, can only be gained by attaining the status of old age. Since "election" depends on manifesting a steadfast conformity to the behavior patterns approved by
794 religion, "elect" are all well past sixty. Adherents, who support the church in every way but have no voice in kirk affairs and do not take Communion, far outnumber these "elect" members. For example, among the religiously homogeneous Free Presbyterians of Glendale, there are 14 members in a congregation of over 300. In Kilmuir, a neighborhood with a rapidly aging population, there are 58 members of the Church of Scotland in a congregation of 211. Portree, as we know, contains a large number of newcomers who are affiliated with the Church of Scotland. Having been brought up in a different religious atmosphere and being relatively free from gossip to which the convert is exposed, they have come forward as members. Thus, the Church of Scotland has

794 125 members. That the Sgiathanach has not been influenced by
794 the laxity of the newcomers in self-examination is indicated by the existence of 450 adherents. Further, the Free Church has only 21 members in a congregation of some 280, and the Free Presbyterian Church only 20 members in a congregation of 320.

The esoteric religious hierarchy established by the "Men" during the nineteenth century revivals continues to influence the lives of the people. From the small number of the "elect" are chosen the elders, the venerable guardians of behavior, and the deacons. The majority have been baptized
545 but are in a fallen condition. Shall we stretch an analogy and ask is this not comparable to the social hierarchy of ceann-cinnidh (clan chief), daoin'-uaisle (tacksmen), and clanna (clansmen) of the past? This much is certain: a strong hierarchial sense must be numbered among the persistencies.

888 In our discussion of the Islanders' economy we noted
575 two significant facts concerning the sodality of the old
794 men of the neighborhoods. We saw that they have a deliberative
422 function in discussing economic innovations before they pass down to the townships, and that they are able to block any innovation of which they disapprove through the requirement of complete unanimity in township affairs. We may also recall the statement, "If you can't respect an elder of the church, who can you respect?" We may now add they have judicial and authoritarian functions in the religious sphere of activity, and, through their status within the church, they ultimately control the patterns of social behavior.

Their deliberative, judicial, and authoritarian functions are identical with those found among the Catholic small farmers of Ireland.[9] Of course, it is by no means unique i human groups for the aged to attempt to maintain their accustomed habits and statuses while the youth endeavor to find acceptance for new ideas.[10] Nor is it unique for the younger members of the society to resent the restraints imposed by the older people to punish deviation from tradi al behavior.[11] Culture phases, as Kroeber has pointed out, associated with age tend to correspond to changes taking place within the society, rather than reflect static lines of segregation, such as those which exist between classes. If these assertions are valid, the success which the elder as a sodality, enjoy in barring the youth from achieving acceptance of novel patterns should be indicative of the importance of age controls on the Isle of Skye. In order see how they exercise control and how successful they are, let us consider those events in the life cycle which Van Ge has called rites of passage.[13]

Rites of Passage

Rites of Passage function in all societies to mark th

ministers increased. The church became the most powerful institution in the Hebrides. In the nineteenth century the pattern of religious expression gradually changed. Although the acculturative process was still carried on, the approach became negative in regards to many aspects of life. The realization that the old folk beliefs had not been stamped out led to a renewed attack on all aspects of the culture which showed the slightest taint of pagan or Catholic belief. At the same time, conservatism became the underlying principle in Presbyterian practice. The ministers and their congregations were carried back to the persecution of the Covenanters under the Stuart kings, back to the days of Knox, and back to the very beginnings of Christianity. This conservatism has reinforced much of the religiously desirable fabric of the culture. Change or compromise has become unthinkable for the majority.

Various interpretations of the present day religion can be attempted. It has been characterized as "moribund theology," a spurious movement wrongly equated with Calvinism and no longer "en rapport with the mind of the twentieth century," by one minister of the Church of Scotland.[1] This reflects the view that the Highlanders' religion has been a form of "black Presbyterianism."[2] Others are wont to write of the "tyranny of religion" which has driven away the youth and destroyed social life, except the art of conversation.[3]

in the nurture of the church by being tested on his knowledge 216
of the Bible and the Shorter Catechism. The elders, then, 651
it in a judicial capacity. If the father measures up to the 888
tandards imposed by the elders and the minister, who is the 794
hoice and, therefore, must reflect their views, the father
s told to present the child for baptism. If he does not
atisfy the elders, his child is refused the rewards of the
hurch until his father mends his ways. Here the authoritarian
unction of the elderly finds expression.

Many men are reluctant to approach the elders to ask
or the sacrament. Everyone knows when a man is going to be
ested and judged. The humiliation of being refused forces
he father to reform. Since the elders think in terms of
abitual behavior, one or even two years may pass before the
ather will feel that he has continuously demonstrated his
onformity to the satisfaction of the elders. Nor is the bond
f affection between the elder and his people and friends
trong enough to procpt any leniency. To do so would threaten
he status of the elders and the continuation of their control.
n one case a first cousin of the minister was refused.

In the trade center village the question of baptism is 349
sore point for the ministers of the Free Church and the Free 626
resbyterian Church. As might be expected, the elders of the 851
urch of Scotland are chosen from the county families and 888
e prominent newcomers. Neither group shares the views of 794
e Sgiathanach as far as their interpretation of circumspect
havior is concerned. For them baptism is administered to

the child. Consequently, the sacrament is normally administered 349
without even the formality of a kirk session examination. The 626
ministers of the other churches assert that non-church-going, 851
drunken fathers whom the kirk session has refused have gone to 888
the Church of Scotland and have secured the sacrament for their 794
children after pretending to mend their ways. They have then
gone back to their former habits. It may be so, but at least
one man in Portree was very surprised to find that the Church
of Scotland can require a severe examination.

At baptism the child is formally introduced into the 851
folds of his father's church. His mother and father stand 794
before the minister and are admonished to bring up the child
in the nurture and admonition of God, to the best of their
ability.

Marriage is not a sacrament in Scotland, and, therefore, 535
does not provoke any strong resentment beyond a feeling that 794
the Church of Scotland should not have the exclusive right
to proclaim the banns of marriage. It is the one time in
the life of a woman when she is the center of attention and 585
has complete control over the situation. She decides where 742
she will be married and what minister will preside. Church 794
affiliation seems to make little difference. At least, the
wedding of a daughter of a strict Free Presbyterian family
in the Church of Scotland did not give the people any cause
to gossip. Although a wedding is no more than a legal formality,
the vows made at marriage are sacred. It would not strike
Americans as being particularly significant to omit the promise
to obey from the ceremony; Americans are said to have an

equality of the sexes. On Skye, where women are the social 535
inferiors of men, its omission is curious. The ministers have 742
taken the promise of the ceremony out because, as one said, "The 794
man may be a rogue, irresponsible, making it impossible for
the woman to obey." She nevertheless promises to be "loving,
truthful, and dutiful."

Election, as a passage rite, marks the attainment of the 794
status of the elderly. We already know that to become one of 851
the "elect" the individual, man or woman, must not only 624
experience a soul-saving change but also manifest steadfast
conformity to the ideals of behavior which have religious
approval. These ideals are the habits and statuses which
the old people are striving to maintain. Thus religion 794
sanctions the status of the venerable old people. Their 888
interpretation of "Effectual Calling" functions to provide 624
the elders, the most eminent of the "elect" with an additional 182
means to exercise their judicial and authoritarian roles.
There can be no rapid conversion. Whether or not the pro-
bationary period of three years imposed by the "Men" in the
last century is still enforced I do not know. The person who
believes he has experienced a saving change, "a visitation
from the Holy Spirit," is examined by the minister and his
elders. Like the father who is seeking baptism for his child,
such an old man or woman is judged on his knowledge of the
Bible and the Shorter Catechism and on his conformity to the
righteous life. No one can experience a saving change unless
he is known, by observation, to have lived an upright life.
The person who continues to pursue his own mundane pleasures

cannot be spiritually enlightened. The individual who is asked 794
about the nature of his visitation is not judged on his ability 888
to raise his family in the nurture of the church. He is rather 624
judged on his preparation to carry on the tradition. He must
be worthy of the respect due to one of his status. While old 542
women are numbered among the "elect," their exclusion from any
active role in the church has kept them socially inferior to
the old men.

I wish I could give some examples of the nature of this 124
"visitation;" however, Skye is a land where the direct question 576
is not used. One can ask a direct question without offending,
but the code of hospitality requires an either affirmative
answer or the answer you think your guest expects. My
circumlocutory promptings on this topic only succeeded in arousing
concern for my soul.

Two groups escape from the control of the elders as it 624
is exercised through acceptance of an individual into the 888
"elect." As mentioned earlier, the newcomers to Skye have 167
come from different backgrounds. Beyond the Highlands, the 104
meaning of "Effectual Calling" has changed over the years. The
youth attend a young communicants' class in which they are
taught the meaning of church membership. Motestein, writing
about the national character of the Scot, maintains that
interest in "election" has disappeared.[14] Most of the members
of the Church of Scotland in Portree would no doubt agree with
him. One attempt has been made on Skye to hold a young 794
communicants' class. It took place, of course, in the Church 888
167

[14] Motestein, op. cit., p. 153.

of Scotland in Portree. Only one girl appeared for instruction. 794
After the significance of her preparation had been fully explained 888
she declined to take the final step. She did not disagree
with the minister's view that she was prepared for membership
and communion, but she was afraid of what her friends in the
Free Church and Free Presbyterian Church might say. She was
probably wondering what the middle-aged adherents of her church
might have to say, too. When the Sgiathanach takes his first
Communion, in Glendale, Kilmuir, or Portree, the people must
be able to look up to him.

The second exception to the age-grade requirement rules 624
among the county people. Because of their social position 888
in the community, which rests on the expression of their statuses, 545
as roles, as landlords, village and neighborhood representatives 794
and leaders, and members of the national class system, and
because of their education in England, the county people
attain membership in the church at an early age. Some have
become elders of the church at twenty-one. To subject them
to the control of the crofters would, obviously, be incompati-
ble with their social standing. Although they are all Church 182
of Scotland, here again religion is a reinforcing factor for
the structure of the society.

Dying, the final act of living, reveals a host of traits 743
which only receive covert expression during an individual's 829
life. While the youth is censured for his spontaneous
pleasures and the adult is criticized for his behavior, the
deceased is always respected. As one woman said, "It is the
one time in a person's life that the people have nothing but

good to say about him." Death is one of the two occasions for 743
an extended family gathering. Indeed, a man's prestige is best 829
seen at his funeral. Without exaggeration, death is the most 624
significant event of living. It is constantly visualized and 564
discussed. "Second Sight," the ability to foresee future 743
events, is mainly concerned with the death of one's "people"
and friends. Since the ministers have been striving to wipe
out this belief, it is difficult to get the people to talk
about it, except in retrospect. Still most of the people,
including many of the newcomers, and not a few of the ministers,
continue to believe that some old people,—they are always
old men and women,—are afflicted with this power. There
was an old man in one township who would not go out at dusk
for fear of seeing a funeral, and there was an old woman who
foretold her daughter's death. Lights seen in strange places
also tell of death. Even the sophisticated Sgiathanach who
has been born and raised in Portree sometimes forgets himself.
A current story on the island tells of a "ghost bus." The
headlights suddenly appear behind a driver on the Sligthan
road. For the newcomers this is a fanciful tale, but for
several of the natives it has a meaning, death.

All plans are prefixed with the phrase "if spared." 743
"If spared, we'll shear the sheep on Thursday." "If spared, 195
I'll go down to see my brother soon." Many of the newcomers
are made to feel very uneasy by this habit, which is as much
a form of speech as greeting people with, "It's wet," or,
"It's cold." When a Sgiathanach asks to have something done

or inquires about a person's plans, he says, "You'll do it 743
tomorrow, then, if spared." 195

Occasionally, a man's prestige status can be judged by 764
the foretaste the people have of his funeral. This, too, is 554
disturbing for the newcomers who prefer to face death when
the time comes. There is one member of the county people who
is extremely popular. Many speak of him as a "true Skyeman."
One day he was being discussed by a small group of women.
After talking about his interest in Skye and what a good man
he was, one summed up their estimation by saying, "Aye, what
a wonderful funeral he'll have." What higher compliment could
there be? The number who attend a person's funeral and,
recently, the number who drive to his funeral are indicative
of his status. Even though having a car does not give the 893
owner prestige - to the contrary it may give the people cause
to wonder where he got his money - to have "friends" with cars
does give prestige. When 200 or 300 men join in the funeral
procession to carry the body to the grave, all the "people"
of the deceased take pride in telling of the "mobs who came."

In death we find one aspect of the crofter's way of life 764
which puzzles the newcomer, especially the government officials, 554
more than anything else. The old people hoard their money.
Welfare workers frequently say, "You never know how much they
have until they die." There are a few crofters, mainly returned
exiles, who are known to have money but continue to live in
tumbled down houses. The newcomer says, "They must like to
live that way." Quite to the contrary, the Sgiathanach has 741
traditionally prepared for death early in life. Once the first

duty of a wife was to weave her winding sheet. Nor is the cost 764
of burial merely buying a coffin. As at birth and marriage, 454
the people who attend a funeral must have their dram. Just as 821
they do not want subsidies to begin life, they do not want to
be buried with public assistance. They hoard their money, even
if it is only a few pounds, to assure themselves of a decent
burial. Another thing that disturbs the welfare officers is 763
the determination of the old and infirm to remain on their 186
croft in spite of all efforts to move them to a "Twilight
Home." Some of these people may have returned to Skye for
no other reason than the feeling, "If I could go back to Skye
to die it would be fine." I knew many people who had come to
America as young adults and "liked it fine." Why did they
return? The answer is always the same, "I was getting old, you
know, and began to think of home." This, of course, is another
expression of the sentimental attachment for the land and its
identity with one's "people."

Paradoxically, for a people who are so aware of death 763
and look upon it so significantly, the churches, one and all, 796
have refused to consecrate burial. There are no prayers for 182
the dead. There is no service for the dying or at the grave
as the body is lowered into the soil. The ritual which accompanies
this final act of living is better described as a rite of
intensification rather than as a passage rite, to adopt the
terminology of Chapple and Coon.[15]

Once the individual dies, his status is fixed for all 060

[15]Chapple and Coon, Principles of Anthropology, pp. 398-399.

eternity. If he was one of the "elect," he will enjoy eternal 763
life. If he was not one of these venerable old men and women, 554
he can expect to suffer eternal damnation. Although baptism 715
is a sacrament and removes original sin, it is only the initial 851
step in the direction of salvation, which election alone con- 763
firms. Neither the minister nor any member of the bereaved
family offers a prayer. "What more can you do than bury him," 764
one woman asked. An old man said, "They are just as well 763
remembered without praying for them." In a community which 762
is dominated by the old people, and in the crofting neighbor-
hoods where so many of the crofters are very old, death can
be expected to disturb the equilibrium of social interaction.
In Glendale during November and December of 1953 funeral
processions made their way through the glen no less than nine
times. The function of the minister is to restore the dis- 793
turbed patterns, both in the family and in the neighborhood 782
(or village). All work stops in the township for three days
from the time of death. Some of the cosmopolitans of the 367
village, seeking to justify their deviating behavior, assert 287
that the lazy crofter looks forward to a funeral because it
means three days of idleness. In the village, of course, it
is no longer possible to bring daily life to a standstill be-
cause the villagers serve a wide area. The "people" of the
deceased do stop work and close their shops. On the day of the
funeral all blinds are drawn until after the procession has
passed.

As he would if there were illness in the family, the 793
minister calls on the bereaved family and leads them in family 764

worship. If the deceased is a Sgiathanach, the minister will 793
call every night, if he can. Otherwise, he may call only 767
once. His participation in family worship helps to reduce
the patterns of interaction within the nuclear family and
within the small circle of "people," "friends," and neighbors
who come to visit and take part. Some sophisticated villagers 164
take this opportunity to justify their own deviations, such 367
as going to a concert; for them this is all "a religious ceilidh
with all their psalm singing, praying, and greeting." The 152
people do not keen, as they do in Ireland, but the women are 362
seldom dry-eyed. Again the villager may comment that the
minister at least should say a few kind words about the dead,
"Just to comfort his family."

On the day of burial a second and more inclusive rite of
intensification is held. On this occasion the function of the
minister, often aided by an elder, is to restore the equilibrium
within the total sphere in which the deceased habitually moved
during his life. If the person had high prestige status, the
ministers of two churches conduct the family worship. All
the "people," "friends," and neighbors, both men and women,
attend. The minister begins with a prayer for the family,
asking God's guidance. This is followed by the singing of a
few verses of psalm by all who have gathered. Next the minister
reads from Scripture. He concludes with another prayer for
the family. If there are two ministers, or a minister and
an elder present, they alternate in leading the group. If
there are any present who do not "have the Gaelic," they
also alternate between English and Gaelic. We have seen how 764

the nearest kin carry the body from the house. The custom 764
is to carry the coffin until the procession is out of sight
of the house. This may mean a few hundred yards or several
miles. Once the body was carried all the way to the grave.
One skeptic said this is why Skye has lost so many people,
"Half of them died carrying the other half to the grave." In
Portree the body is carried across the bridge on the far side
of the town. All the mourners, except the women who remain at
home, and the two nearest kin who walk before and after the
coffin, are given an opportunity to carry. They continuously
change positions with the carriers, stepping out at the head
of the line by sixes and waiting for the coffin. Those who
have carried fall in at the rear of the procession. When they 602
reach the graveyard, the original carriers, his nearest kin,
remove the body from the hearse and lower it into the grave.
At the grave the minister delivers a short lecture on the merit 793
of living in the nurture of God. Only the Church of Scotland 795
ministers offer an additional prayer for the family. The other
sects believe a prayer at the grave is a prayer for the dead.
Following the interment, the bereaved family provides the 273
mourners with a dram of whiskey. Does the minister take a 793
dram? I can only give the reader the answer I received after
one funeral. One fellow said, "I guess nobody saw him take his
drop, but if he didn't I'd be surprised." On the following day
life returns to normal. The equilibrium of interaction has
been restored.

The Role of Religion on the Croft

As the prestige of the old people and the control of the 593
family-head elders over the social activities of the people has 182
persisted with religious sanction, the status of the father 771
within the nuclear family has been reinforced by the religious
expression of his role. As we know, the older inter-family
patterns of economic cooperation have been disturbed by the
changes stemming from the process of commercialization. This
has not disturbed the position of the father as the source of
authority and discipline. He continues to play a basic role
in establishing the tempo of interaction within the home, the
township, neighborhood, and community. He decides who will
do the work and when. He determines in what social activities
his wife and children will participate, always, of course,
ultimately guided by the venerable old men. His status is
confirmed at baptism, when he is judged, and it is commonly
reaffirmed every day in the home. For the majority of crofters, 204
though by no means all of any sect, the day begins with the 762
saying of grace before breakfast and the returning of thanks 312
after breakfast. The same pattern is repeated at the taking
of any food, including a cup of tea. The form of grace may
be used to cast light on the religious outlook of the Sgiathanach:
"Gracious God, we have sinned against Thee, and are unworthy
of Thy mercy; pardon our sins, and bless these mercies for
our use, and help us to eat and drink to Thy glory, for Christ's
sake. Amen."

In many homes breakfast is followed by family worship. 593
The father begins with a blessing, a prayer on behalf of his 182
family, and then leads the family in the singing of a few 771
verses of psalm. Next he reads from Scripture, apologizing 312
to the visitor because his Bible is not an English version,
and comments on the meaning of the passage. He concludes with
a prayer. If the morning worship has been omitted, he holds 592
an evening service. Some crofters have family worship both
morning and night. When the father is away, his wife or his
eldest son conducts the worship. Religious devotion on Skye, 771
then, is more than Sabbath church attendance and attendance
at weekly prayer meetings.

The Role of Religion in Township, Neighborhood, and Village

I did not attempt to devise a socio-metric scale to 795
determine the affiliation of members and adherents of the
several churches in either Glendale, Kilmuir or Portree. The
former disunity and conflicts which divided families, both
nuclear and consanguineal, townships, neighborhoods, and the
village stemmed from abandonment of traditional religious
affiliation rather than from attachment to an established sect
which happened to differ from the denomination of one's kinsman
or neighbor. Today sectarian hostility is no longer prevalent
among the people. The Sgiathanach only chafts his neighbor
in friendly banter and repartee, about his only slightly different
sectarian views. They refer to each other's sect by nicknames.
The Church of Scotland is the "Established Church." The

people of the Free Church are "the Wee Frees." The Free 795
Presbyterians are the "Seceders" or, at least to some of
the gentry, the "Split P's." Arguing about religion is 376
considered very bad taste. It is left to the ministers, 793
and they do have their points of difference. One Free 715
Presbyterian minister, for example, told me that no one in 748
the Church of Scotland, including the minister, was worthy
to receive Communion. On many occasions during the year
the ministers of the Free Church and Free Presbyterian
Church devote part of their sermon to a criticism of the
Church of Scotland, not to mention the avid hostility of all
Skyemen toward Catholics.

Adherents of the several sects intermarry with no qualms 57
and without suffering any loss of status. By the time a
person gets to be a member, marriage is no longer in his
mind. Husband and wife continue to adhere to their respective 57
denominations, those in which they were baptized. The children
naturally, are baptized and raised in the church of their
father. Extended families are often divided religiously 57
along sectarian lines. In one family one brother and his 771
wife were Free Presbyterians, another brother and his wife
were Free Church, a sister was Church of Scotland. The
parents had been Free Church but became Free Presbyterians
at the turn of the Century. At least one cousin was United
Free Church. This religious schism did not affect their
affection for one another. Once a week the sister went to
have tea with her Free Church sister-in-law. Periodically

her brothers and their wives came to visit, and at New Years 576 795 they came by with their bottle of wine, whiskey being a man's 273 [562] drink, to toast the New Year.

Excepting Glendale, where church membership and af- 621 filiation is synonymous with the neighborhood, the township 795 may contain affiliates of two or three churches. One small 571 township contains two Free Church families, two Free Presbyterian families, and one Church of Scotland family. As in any township, they visit one another and cooperate in handling the sheep flocks. Further, the Church of Scotland family often gets out the truck on the Sabbath and drives everyone to Church. This is one of those isolated townships far off the beaten track. Although I certainly agree that people who meet together at a church and pray together get to know each other better because of their religious unity, in this township the families have come to know each other better because they go off to their respective churches together. There is a firm, basic belief 795 among the people that no one should be slighted, even by a 829 minister, because he has differing religious sympathies. 798 Were this not so, think of the position in which I would have found myself. One Free Presbyterian family put it this way, "Who can tell which church is the right one since they all claim to be on top of the pole? Maybe they all are and everyone will get to his final resting place." The "all" was later qualified to exclude Catholics. One of the gentry told me an amusing story on this point. One day during the

blitz of London he was talking with a crofter's wife, and they 795 got to discussing Hitler. "What a terrible man he is," she 829 said, "Why he's worse than...worse than...almost as bad as the 798 Pope." In another township there is a Church of Scotland 795 missionary, a lay preacher. His religious sectarianism does 797 not prevent his interacting with the Free Presbyterians, who are in the majority. Not infrequently, he visits his neighbors and when they need help on the croft he is prepared to lend a hand. When he pays a call, he establishes the tempo of interaction at mealtime or tea time by saying grace and returning the thanks. This is part of the hospitality 574 of the Sriathanach. The visitor is always asked to say 782 grace.

What is true of the township on Skye, is also partly 621 true of the neighborhood. Here the members and adherents of 794 the same church do get to know one another better because of a common faith, or their particular interpretation of a faith common to all. They see each other with greater regularity. Then, too, since the congregations are small, they feel they belong. At the same time, the patterns of interaction are not exclusive, except in Glendale. The religious cliques are [476] [795] mutual aid groups, doing what they can for the infirm and destitute; they are not opposing factions. Nor does religious homogeniety mean the absence of factions. Glendale has its independents who are set against the disciples of the Department of Agriculture. Anyone who knows Wales may be struck by this 795 difference, for in Wales the people are attached to a particular 171

chapel and its group.[16] On Skye the people can be as much 795 attached to the sect or their minister as the group. The [171] reason for this difference between Skye and Wales may be the 793 recency of the appearance of the several churches on Skye. As presently constituted, all the churches were formed at the turn of the century or later. The first Free Presbyterian congregation was formed in 1896. The present Free Church, often called the Free Church (continuing), dates from 1900. The Church of Scotland is the result of unions with the Free Church in 1900 and the United Church in 1929.

My assertion that attachment is to sect and minister 793 can be substantiated by two events, one in Portree and the 795 other in the neighborhood known as the Braes. In 1900 when 798 the Free Church and the United Presbyterian Church united, the Free Church minister in Portree led his congregation over to the Church of Scotland in a body.[17] Only three policemen's families, all of them newcomers, refused to follow the minister. For 13 years there was no Free Church congregation. Our three families attended the Free Presbyterian Church, until the minister at one Sabbath service held forth on the shortcomings of the Free Church. They left and began holding services in the Court House. In time the congregation grew. A missionary was appointed and later a minister. More recently, a minister of the Free Presbyterian Church, who was noted for a certain amount of leniency, such as

---

[16] Rees, Life in a Welsh Countryside, p. 115.

[17] For a similar change in Kilmuir, see Chapter IV.

allowing his flock to attend concerts, had a point of differ- 793
ence with the Synod and was removed. In the Braes which had 795
been as staunchly Free Presbyterian as Glendale, roughly 798
half of the congregation changed their adherence to the Free
Church. The remainder have continued true to their own sect
under a new minister.

There are numerous Free Presbyterian families far 795
beyond the reach of a minister. All they can hope for is an
occasional visit, and there are no missionaries of this sect
on the island. Although they attend services at the nearest
kirk of the Free Church, doctrinal differences are still
important enough in their minds to keep them within the folds
of their sect. They were born in it and will die in it.
Moreover, despite the lack of a minister in Glendale between 794
1908-1911, 1913-1920, and 1931-1933, the people are as staunch 793
as ever. At such times one of the elders steps forward to 794
conduct services as he would during the temporary absence 888
of the minister. His ability to fill the role of a spiritual 554
leader fortifies his control and his prestige. This is true
in Portree. The elder, even a newcomer, who stands in the
pulpit is deeply respected. Identity with, and attachment 796
to the denomination is maintained in the absence of a minister
by visiting other churches at the Communion season and by
the visits of a minister on the Sabbath and for annual
Thanksgiving services following the harvest. So strong is 795
the sectarianism of the Glendale crofters that the Church of
Scotland minister for Duirinish is convinced that "Churchianity

rather than Christianity is the prevailing practice in Glendale." 795
This attachment to a sect is all the more significant in the 796
crofting neighborhoods because there is not one iota of differ-
ence in the Gaelic services in any church. The difference is
doctrinal.

In the neighborhood the affiliates of the same church 571
have been said to interact with their fellows more regularly 794
than with the remainder of the group. They come together on 795
the Sabbath for a regular service and on Wednesday night 796
for a prayer meeting. On the Sabbath they come as families, 593
husband, wife and children and they sit together. Normally 562
the sexes are segregated in public. Indeed, in the home 574
men keep to one side of the fire and women to the other when
there are callers. They also leave in family groups. Their
interaction is spiritual. There are no gatherings outside
the church either before or after the service to gossip,
discuss the stock, or even comment on the weather. They
will all know who was absent, but they will only greet their
fellows with a slight nod. The Wednesday night prayer
meeting is different. This is a group situation. Some come
by bus and gossip on the way. Others get together before
and after the service for a chat. At these prayer meetings 554
the stature of the "elect" again emerges. They offer the 888
prayers on behalf of the congregation. The prayers, it should 782
be noted, are extempore. No form is followed. The basis for
them are passages from Scripture and interpretations of the
passages.

There is another aspect to the prayer meetings. They 796
are no longer held in the Church of Scotland in Portree. 795
The ministers of the other sects say this is an indication 794
of the low degree of spiritual enlightenment among that 369
congregation. Further, Wednesday night is picture night in
the village. The newcomers taunt the devout with, "off to
the pictures?"

It is at these Wednesday night meetings that the people 55
get to know one another. They participate in the worship 57
through the eminent "Men," who in a society such as Skye 796
where almost everybody is related on one side of the family 794
or the other by some bond of consanguinity or affinity, are 802
the "people" or "friends" of the worshippers. This custom of
offering extempore prayers not only augments the prestige of
the "elect" but it intensifies the unity of the group and
makes them secure in the knowledge that they belong. This
feeling of unity and the sense of belonging is further
strengthened in some churches by setting aside a day of
Humiliation. Services are held during which the congregation 78
as a group beseech God for forgiveness for the poor spiritual
condition of the world. In their minds the God of this world
is surely the Prince of Darkness.

But for the interaction of the members of the several 794
sects, the control of the "elect" would not be as strong as 795
it is. The elders of one kirk cannot exercise any direct 626
control over the adherents of another sect. Through what
agency could they express their judicial and authoritarian

e of the individual from birth, through his age statuses, 121
th and to re-establish meaningful patterns of interaction
a disturbance by an event in the life cycle. When 851
dual and reciprocal patterns of behavior following birth 774
escribed, I pointed out that they were a much modified
al of the old practice of kirking, the custom of having
rents, their "people," and "friends" attend a church
e to offer thanks, followed by a feast and dance. Similar
ities once accompanied baptism. As the first event in
fe cycle which concerns the church, and as one of the
crements celebrated in the church, baptism is of supreme
ence. In addition to revealing the amount of control [121]
derly have over the group, it shows how the status and
f the father has been maintained.

The child's father, as the religiously sanctioned head 626
family, approaches the elder for his township and 851
ts the administration of the sacrament. The elder, in 888 774
intimates the father's request to the minister, who
alls a kirk session. At the kirk session the father is
ed. He must live an exemplary life, in the way of the
, including regular sabbath church attendance, daily
p in the home, and the renunciation of all forms of
ous amusement. The elders, of course, know how he
ally behaves by observation and reputation. In Glendale,
in Kilmuir, the minister knows as well, for, as one
said, "You never know what your neighbors will run and
he minister." Sudden reform is not good enough. The [774]
must also demonstrate his ability to raise the child

me as in the crofting areas. When a young girl presented 794
rself for instruction in the significance and meaning of 796
urch membership, preparatory to her acceptance of Communion, 348
626
e refused to take the final step not because of any personal
ligious problem, but rather because such a step would upset
r normal associations. What her Free Church and Free
esbyterian friends would say was her main concern. Who was
o to become an "elect" member? Here, then, is the answer
how the elders of the other sects are able to control
havior of the larger group, through the fear of gossip as
negative social sanction and, perhaps, rejection.

The semi-annual Communion celebrations are rites of 794
tensification par excellence. Although some churches 796
lebrate only one commemoration of the sacrament, and it
y be as early as February or as late as November, the
nths from late April until early September, are commonly
ferred to as the "Communion Season." The activities of
e people during this period cast additional light on the
fluence of religion in ordering social relationships. While 573
[571]
ique membership based on sectarian affiliation is a secondary
ctor in determining the patterns of interaction in the extended
mily in the local group, it is very important in determining
's wider relationships, the relationships between the
ighborhoods and between the Sgiathanach and the mainland
ghlander.

Within living memory thousands used to come to the 178
mmunion celebrations from all parts of Skye and many nearby 794
796

mainland villages and crofting areas. Ministers from 178
neighboring and even distant churches used to come to take 794
part in conducting the services. There was no church to hold 796
so many people, so the Communion was celebrated outside. Then,
of course, the population was much larger and the majority
belonged to one church, the Free Church.

The Communion Season is still marked by large gatherings 794
of people at each church in turn. The "elect" from the 796
neighboring churches and the ministers from churches near and
far exchange visits. The adherents also participate in the
celebration of the Lord's Supper. From Thursday until 794
Monday the homes of the people in the vicinity are open to 796
their relatives and friends who have come to partake of the 574
sacrament or who find the highly emotional atmosphere and
gregariousness stimulating. Some, especially the "elect"
stay for the five days. Others will spend one or more nights.
During the day and in the evening, whenever they are not
attending religious services, they visit their "people" and [571]
"friends" to renew ties which in many cases have been allowed
to languish since the last Communion. Thus, we find religion [182]
sanctioning the time-honored custom of Highland hospitality.
It is interesting to note that many a woman who depends on [495]
the tourist trade for a good share of her income will not accept
paying guests at this time. The local people have a further 794
share in extending hospitality to their visitors. All who 796
are able send food to the manse (parsonage) to lessen the 574
burden on the minister who extends hospitality to the 793
visiting clergy and as many of the laity as he can. This

custom is well established. Even war-time restrictions and 794
fationing had little effect on Communion attendance. Skye 796
exiles in the United States and Canada sent food parcels 793
to the ministers and their kinsmen to provide for their 574
visitors. The minister takes in as many as he can. One [167]
minister, for example, not very far from Portree has a large
manse with seventeen rooms. It is customary for him to have [269]
twenty-five or thirty people for lunch and again for high
tea (the Skyeman's evening meal) on Friday and the Sabbath.
Many of his guests spend five days with him.

Some idea of the size of the gatherings may be gained 794
from the need for the Free Presbyterian Church in Portree 796
to hold duplicate services. The church, I should think,
holds around 300. During the Communion Season, the con-
gregation takes over the drill hall, normally used by the
Territorial Army for training and by the villagers for social
affairs, in addition to the kirk. In the drill hall services
are held in English; in the kirk, they are in Gaelic.

Such large gatherings of people require a means to
establish meaningful contacts and create a feeling of belonging.
Thursday is a fast day. All work stops. The people attend
services in the morning, at noon, and again in the evening.
Their minister, assisted by two visiting clergymen conducts
them in a dynamic, highly emotional appraisal of the coming
event. All the ministers participate in the sermons, stressing [783]
the confession of sin and the need for humiliation. Many
ministers are known for their preaching ability, that is their

ability to move their listeners. Friday is a day of self- 794
examination and prayer. A fellowship meeting is held. The 796
senior minister gives the sermon. The local minister follows
the sermon with a few lines of psalm, which the precentor
will chant for the congregation to sing, and calls upon one
of the "elect" to prepare a question. After the singing has
finished, an elder of the host church presents his "question."
The "question" is a line from Scripture which relates to
human experience, which relates to their experience as pastoral-
agriculturalists. The remaining "Men," customarily visitors
from other kirks, speak to the question, giving "marks" (examples)
which distinguish between those who possess Christian virtues
and those who profess the virtues essential for salvation.
The speakers interpret the meaning of the line, it is only a
single verse, often using allegorical interpretations. They
are not supposed to tell about their own spiritual experience
of conversion. To the contrary, their discussion is intended
to have significance for all present. At the end of three
or four hours of "speaking to the question," the junior
minister sums up what has been said and, infrequently, makes
any necessary corrections.

In addition to establishing an emotional atmosphere of 786
revivalism and the tempo of interaction between the visitors 888
and the local congregation, the fellowship meeting introduces
the venerable old men of neighboring churches to the local
people. Their prestige extends beyond their own neighborhood
and congregation. Their ability becomes a topic of conversation

for the approaching evening and many nights to come. 794
796
Saturday is a day of preparation. After a morning 573
service, those who have been examined by the elders and ad-
mitted to church membership, and the visitors who satisfy the
elders of the kirk that they are worthy to receive Communion,
receive tokens which will admit them to the Lord's Table on
the following day.

On the Sabbath the service is oriented around an "Action
Sermon." The minister speaks of the sufferings and blessings
of Christ. At the conclusion of the sermon, the Lord's Table
is "fenced." Once all the Highland churches gave communion
at a table with a rail around it. Now there is only one kirk
on Skye with the fenced table, the old parish church in
Bracadale. Today the first few pews are used. The minister 794
draws a sharp distinction between those who are entitled to 796
sit at the "table" and those who do not have the right to 573
partake of Christ's body and drink of His blood. The former
are reminded of the dangers which neglecting to come forward
involves. The latter are warned of their promised damnation
as a consequence of partaking unworthily. Since only the 888
old men and women are worthy of the sacrament, the minister's 786
exhortions and denouncements function to sanction the prestige 182
of the old people before the congregation and the wider com-
munity. After reading from the Bible, offering a prayer, and 794
addressing the communicants on their humble position, the bread 796
and wine is distributed.

The Communion is concluded on Monday morning with a

794 thanksgiving service. The visiting ministers, the "elect,"
796 and the adherents go their own separate ways. They have spent
five days in intense, emotional spiritual communion and they
carry away with them definite, vivid remembrances. Many of
them will meet again in a few weeks when they will exchange
[571] the roles of guests and hosts. The reciprocal nature in all
interpersonal activity on Skye is well developed. In many
ways, the Communion season parallels the Welsh Song Festivals.[18]

794 We noted earlier in our discussion of the Communion
796 season that there has been a decline in the number who attend
178 the Communions. I should like to add a few general consider-
ation to what I have already said on this point. Aside from
the influence of depopulation, there have been several influ-
ential factors in operation. The smaller attendance is
traceable to some extent to an almost imperceptible movement
by the youth away from the more conservative denominations.
The ever-increasing necessity of working for a wage, es-
pecially since most employment opportunities are in summer time
programs, is another cause. This factor is not, however,
important within the local kirk district because most ad-
herents and all the "elect" who work take a vacation in order
to attend. It does mean that visitors may only be able to
attend on the Sabbath.

178 The custom of visiting has almost disappeared in some
794 churches, including the Church of Scotland in Portree where
796 the fellowship meeting is no longer significant because the
348
574

[18] Rees, op. cit., pp. 129-130.

"elect" are predominantly newcomers and the elders are either members of the landed gentry or newcomers. I was rather amazed one day when a Skyewoman told me, "the 'Wee-Frees' and 'Seceders' are no better than the Mohammedens giving gifts to idols," when they sent food to the manse for the minister's guests at the Communion. Over in Bracadale the custom is also losing its importance, except in the Free Presbyterian Church, and the fellowship meeting has been abandoned in the United Free Church because of the reluctance of the members to engage in public displays, either at Communions or at prayer meetings. The custom of visiting has entirely disappeared in Sleat and Strath. One of the ministers ascribed this to the isolation of the two parishes from the rest of the island and from each other. Certainly the Sgriathanach on the south end of the island seldom locks to Portree and the northern crofter hardly ever goes to Sleat, but this does not explain why people from the mainland will go to Bracadale, by-passing Strath.

The vitality of religion can over-ride considerations of family and friendship if a Sgriathanach deviates from the accepted norm. We may recall the young girl who stole church funds and was ostracized by her "people" and the whole community. Let us consider another example. Marriage vows, as we know, are held to be sacred on Skye. Divorce is all but unknown and separation is uncommon. To be precise there are four known cases of separation. Nevertheless, if a husband or wife were to break a taboo, it is expected that the offender would be cast out. Forgiveness is not compatible with a

179 199 196 574 369 198 771 626 586 771 626

belief in a God who punishes iniquity "unto the third and fourth generation."

In one family the wife transgressed by committing adultery, albeit a rare sin. Her husband was one of the "elect" and a deacon in the Free Church. Fully aware of the fact that his wife had remained away from Skye until after her child was born, he took her back. He was older than she and devoted to her. The story could not be covered up on Skye, where the elders have their thumbs on the pulse of the congregation. The elders summoned him before the kirk session. After he admitted he knew all the details and the fact that his sister-in-law had taken the child, they declared him to be excommunicate. The control of the elders is still characterized by austerity and severity toward the godly and ungodly alike. What hope has a Sgriathanach once he has been eternally denied salvation? Perhaps, someday he will again receive a visitation from the Holy Spirit and experience a saving change. Although no longer entitled to the benefits of the church, he continues to attend, as an adherent. One may ask, what was the reaction of the people to this punishment? A few Church of Scotland people, feel that the elders might have tempered their decision. As one said, "They thought only of Moses on Mount Sinai and forgot Jesus on Calvary." Most of the people, however, including all in the Free Church and Free Presbyterian Church, either approved the action taken or, at least, would not question the judgment of the elders.

586 771 626 684 771 626 771 794

Religion has done more to keep the Gaelic language alive than any of the numerous outside agencies dedicated to the preservation of the language, such as An Comunn Gaidhealach, a national organization which sponsors a series of local, regional, and national programs in an attempt to maintain and stimulate an interest in the Highlands and their songs and stories. Except in Portree and at Dunvegan, church services are mostly conducted in Gaelic. The newcomer who wishes to attend church services in the crofting areas, and he had better, must either learn Gaelic or be content with the few words the minister may speak in English for his benefit if the minister is aware of the presence of someone who does not "have the Gaelic." Some might feel that this is rude since most Skyemen are bi-lingual, but the crofter seems to think quicker in his own tongue. Many crofters' children learn English only when they begin to attend school or pick it up from an older sibling who is going to school. Family worship is almost always in Gaelic, unless there is a visitor. We have already seen that the family worship at the time of death is in Gaelic or in Gaelic and English. Again we have a parallel with Wales, in that Welsh has been mainly preserved through religion.[19]

Making Gaelic the language of their religion has, however, led to several problems. It has weakened township solidarity on occasion. There are many isolated townships beyond the reach of a minister. In one of these remote

771 191 186 575 191 794 [87] [182] 191 771 621

[19] Ibid., p. 129

glens a family, newcomers to Skye, prevailed on the local school teacher to hold a Sabbath school for the children. The local missionary objected. If they were going to have Sabbath school, it should be in Gaelic. His prestige and control over the population secured his position. The children of the people who originated and organized the program were excluded because they did not "have the Gaelic."

Another problem which is beginning to stem from the use of Gaelic as the language of religion is the difficulty of securing a minister. Traditionally, it was an ideal to send a son to study for the ministry. This ideal remains, but in the last few years only one young man from Skye has shown a desire to become a minister. Indeed, the majority of ministers on Skye are not Skyemen. I believe the only minister who serves his own neighborhood, the neighborhood in which he was born and raised, is the Free Presbyterian minister in Glendale. It is becoming more and more difficult to fill charges as they go vacant. Each year several Highland charges are changed from "Gaelic essential" to "Gaelic preferred." If we go beyond the role of religion as it orders human relationships, through its more formal aspects, and consider the influence of religion on the secular behavior of the Sgriathanach, we can come closer to an understanding of why the youth are slowly turning away. At the same time we shall be able to round out our picture of the expression given to the Presbyterian ethic on Skye.

191 771 621 191 794 [183] [87] 121 771 626 178

The Presbyterian Ethic

Asceticism, of the sort discussed by Kroeber, is a fundamental feature of the expression given to the Presbyterian ethic by the Sgriathanach.[20] The deliberate practice of austerity, first noted at the time of the Revival under the lay religious brotherhood of the "Men" of Skye, and the willful abstinence from sensory pleasures, which has become a religious sanction for the hardships and economic limitations which accompany crofting, have received social enforcement. This is a well known ideal of Puritanism.[21] It is not, of course, restricted to Western tradition. The Melanesians of Manus, until Margaret Mead's recent study, were described as "censorious, joyless, vindictive, burdened with a sense of the world's wickedness."[22] I have not seen her complete report, but they seem to have changed. A parallel closer to Skye is found in Wales. There, too, abstinence, restraint, and negation are typical traits.[23] On Skye, as in Wales, asceticism is a by-product of previous experience and a consequence of a dynamic revival movement.

The world is the enemy of Christ. As one minister said, "The world situation continues to deteriorate and the God of this world increases his many schemes for ensuring

785 777

[20] Kroeber, Anthropology, p. 598

[21] Ibid.

[22] Ibid., p. 599

[23] Rees, op. cit., pp. 126-127.

that young sinners will not escape from his kingdom." 785 779
Another of the same church expressed himself, "One is constrained to look upon this world as a great battlefield between Christ and the devil and between grace and sin. In our day the kingdom of darkness is carrying everything before it; the Prince of the kingdom of darkness is the god of this world." This attitude is not, however, carried to the extreme that characterizes the Old Order Amish in their determination to "Be not conformed to this world."[24] On Skye, the position is rather that the church, as Christ's witness, must resist the encroachment of worldly pursuits. In a world which is moving as fast as ours, the success 888 626 794 of the resistance of the church is indicative of the hold of the pillars of the faith, the venerable old man, over the group. We have learned how the prestige status of the [554] "elect" and the elders stems from their high position in the esoteric religious hierarchy, and how, through their power to withhold the sacraments, they enforce social control. When the elders sit in judgment of the father whohas come to ask that his child be baptized, or the person who thinks he has experienced a "saving change," they base their estimation of him on his non-religious behavior as much as his knowledge of the tenets of the faith. He must [785] not only attend church regularly and conduct family worship; he must also deny himself all pleasures of a frivolous nature.

[24]Kollmorgen, Culture of a Contemporary Rural Community: The Older Order Amish of Lancaster County, Pennsylvania, p. 1

The man who seeks sensory pleasures and finds enjoyment in 785 779
mundane recreation is believed to be spiritually unenlightened. It seems almost an anticlimax to add that social life is restricted.

Beyond the Highlands and, indeed, within the Highlands 771 883 571
in certain prosperous areas, where poverty has not been a factor of such importance that it requires religious sanction, the Church of Scotland has endeavored to find room within the church for recreational activities, especially for the youth. As in America, the church feels a responsibility to the youth which requires a combination of religion and recreation if the citizens of the community are to be well-rounded adults. Youth programs and youth clubs, young adult groups, and social circles for the older men and women are an essential part of church work. In 794 571
an organizational sense, the Church of Scotland on Skye has, at the most, a Woman's Guild which meets once a month to hear a lecture on a topic such as missionary work in India, and which holds an occasional sale of work to reduce the church debt or buy the minister an electric tea kettle to keep in his vestry; and a choir, which meets once a week for rehearsal. It is, as I have said before, not the overall policy of the church which determines the activities in which the people participate or which they reject. The 888 561 626
elders are the prime movers. Were the youth in Kilmuir anyone under thirty, instead of anyone under forty, the control of the aged might not be as strong as it is. In

the Outer Isles, an area of recent depopulation, there are 888
enough youth to resist the dictates of their elders.[25] If 561
they cannot have a dance in a hall, they hold their dance 626
on a plank bridge. In Kilmuir the crofters are looking forward to "Effectual Calling." To defy the elders, or allow their children to run counter to the wishes of the elders, would mean a loss of all hope for salvation.

For the majority of crofters, any form of amusement 785 795
is objectionable, but there are slight differences among the affiliates of the several sects. The Church of Scotland is the most lenient. For adherents, concerts, film shows and similar organized forms of entertainment may be admissible, especially if they are held outside the neighborhood. There [548] is a "picture bus" from Kilmuir to Portree on Wednesday and [346] Saturday night. Sports activities are often considered [526] as wholesome outlets for the youth. Some of the ministers, feel the lack of social contact with their people and believe they might do some good by taking part in life outside the pulpit. The Church of Scotland minister in Kilmuir occasionally attends the Crofters' Club, the only secular activity admitted in the neighborhood. Significantly, Free Church opinion, although the voice of a minority, has prohibited the playing of pipes and recitals of the Gaelic Choir at the annual agricultural show. The Church of Scotland minister in Sleat has taken a hand in the village hall. Unorganized dances are condemned. This is not because dancing [535]

[25]Darling and Morley, op. cit., pp. 21-24.

is a sin but because of the excessive drinking and immorality 785 795
which might result from a promiscuous gathering. Organized [535]
dances are, in general, not objectionable. Nevertheless, in spite of the attitudes of the people to these secular activities, the Church of Scotland crofter behaves in much the same way as his neighbor who adheres to another sect. The elders of the [888] other sects have an influence over everyone in the neighborhood. [554] Every man must ask himself, "What will my neighbors say?"

The Free Church and Free Presbyterian Church people 785 795
condemn any and all social gatherings where songs, stories, 571 574
or other diversions are admitted. When people visit, they are expected to remain circumspect in behavior. They may discuss their problems and gossip about their neighbors or the wicked newcomers. They may engage in cooperative or individual work. They may eat together in the home. They may not engage [269] in such activities outside the home. Religion on Skye for 785 795
the majority has centered attention on the home. Let us look 575
at some of the activities which are condemned. There is the Woman's Rural Institute, an organized woman's club dedicated to stimulating home industries in rural areas and providing educational programs, especially demonstrations and lectures on domestic arts. One meeting, for example, at Uig, not far from Kilmuir, was addressed by a school teacher on the subject of Highland Folklore. He was followed by a knitting contest and tea. Youth Clubs and Young Farmers Clubs do not exist, except in Kilmuir where the Young Farmers Club is under the Crofters' Club, and, of course, in Portree. Village halls are dens of iniquity. While we were on Skye one was built

at Skeabost. A minister drove by one day and said to the 785
workmen, "Don't you know you're building a house for the Devil?" 795
One of the laborers, a Lowlander, replied, "It's a good thing 575
we have a place to keep him." The Order of the Eastern Star
and the Masons are condemned because, while they are religious,
they are secret orders. Even if the person's religion did not
stand in the way of his becoming a Mason, his distrust of
mystery probably would. As one young fellow said one night in
the bar when being chaffed about the Masons, "I'm not going
to join any secret organization until I know what the secret is."

Included among the objectionable activities by these two 785
churches are the traditional Highland Games, held each year 795
at Portree in August, probably about the time of the old Saint's 541
Fair. The day is a school holiday. Aside from New Years, it
is the big occasion of the year. People come in from all
over the Island. Few of the Skyemen actively take part in [526]
the contests of tossing the caber and throwing the stone, or
in the piping and dancing competitions, but they look forward
to the event. It gives them an opportunity to see their [571]
"friends" and join them in the pub for a dram. Although the [293]
ministers disapppprve, they lack the backing of the "elect," so
the games go on each year. I hasten to add that they have
lost much of their appeal in recent years, but I am told that
this is due to the fact that the clique who runs the Skye
Council of Social Service has, in an effort to attract tourists
early in the season, set up Skye Week in May. Included in
the Skye Week program are Highland Games. I might also add

that the people of Skye, including many of the newcomers, 785
have not been favorably impressed by Skye Week. The consensus 795
is that it is not representative of Skye. For the Sgiathanach 541
the Highland Games are alright, but the concerts, dances and
similar festivities only cause ill feelings.

As might be expected social life is more vivid in Portree. 369
Here the members and the adherents of the Church of Scotland 795
partake of a number of recreational activities. In the winter 52
there is badminton twice a week. In the spring and summer [526]
there is a little golf and tennis. The limitations are not [529]
religious; they are climatic. Then, too, there is shinty.
We have already noted the existence of many clubs. There are [535]
regular dances. Moving pictures take place twice a week. [541]
All of these activities are run by newcomers; the Skyemen have [167]
a more or less passive role. The "elect" of the two smaller 795
sects are, to say the least, very much disturbed by these 794
frivolities. What is worse, the children attend the dances 626
and the concerts and the boys play shinty. They can find 883
enough solidarity among those of their own age grade to out- 52
weigh the threats of their elders. Apparently they find
enough security to be unaffected by the stern denunciations of
the minister from the pulpit. When they marry, however, they 794
have to recast the pattern of their behavior, for now the 883
elders are in a position to exercise control by withholding 626
baptism from their children. Some may turn to the Church of
Scotland.

Standing in marked contrast to Portree, in Glendale the 883
control by the aged is complete. There is not a single activity 883
626
[541]

at which the youth can join together as a sodality; hence, they 883
hardly ever have a chance to question the control of the "elect." 883
Only once in recent years has the control of the old people 626
been criticized. After World War II, the men who returned to 578
the neighborhood wanted to erect a village hall. This threatened 883
both family unity and the solidarity of the neighborhood. 883
The young people were divided between the time honored obligation 626
to honor their parents and their own desires for a fuller life.
The parents were torn between religious beliefs and their
affection for their children. The minister and his elders
were faced with a situation which threatened the fundamental
tenets of the faith and the continued ability of the religious
expression to sanction the existing order. How strong are age
controls? The youth did not get their village hall. Many of [167]
them left Skye for the Lowlands where social life is less
restricted.

The difficulty is that until, say, forty years ago the 178
traditional outlets were sufficient. Middle-aged people 883
remember how the youth used to drop in on the old widow for 177
a visit on an evening and then make their way off in couples 52
for a bit of courting. Two World Wars and the continuing
program of National Service, not to speak of the influence of
the schools, have given the youth a new perspective. They
have spent one or two years in an environment where recreational
activities are considered not only innocent but also wholesome.
The radio and magazines have contributed to the demands of the
youth for amusements. As if this were not enough, there are

several agencies who have taken the task of bringing movies 178
to the remote crofters in the belief that the Highlander is 883
more likely to stay if he has a share in the life of the 177
Lowlander and the Englishman. These agencies want to "create" 52
a more adequate social organization."

Out of boredom, some young men try to add some spirit 273
to their lives by turning to "the drink." Although the 779
religion of the Skyeman is strikingly similar to that of
the rural dweller in Wales, I found the Welshman and the
Sgiathanach have quite different views on the subject of
temperance.[26] All churches support temperance, from the
pulpit and from the kirk collections, but abstinence or
prohibition has never been accepted. Perhaps, their main
reason for consistently rejecting the idea is their wont
to base many of their decisions on Biblical directions.
There can be nothing inherently wrong in the infallible Word
of God. Then, too, to the Sgiathanach, whiskey is not Scotch; 273
it is the "water of life." The importance attached to the
dram can be judged from its functions at birth, marriage,
and death. It is also the means of thanking a man for doing
a favor which cannot be repaid. Thus, while abstinence is
a major religious tenet for the Welsh, temperance is the
aim of the Skyeman.

The temperance movement has had an effect, all over 275
Scotland. The "pubs" are no more than a long bar set in a 185
bare room. Young men who have spent time in England, where
the local "pub" is a closely knit club for the villagers, frequently

[26] Rees, op. cit., p. 127

contrast the friendly and homely atmosphere of the English 27
"pub" with the austerity of the public bar on Skye. The same 18
man who went into the "Coach and Four" to play a game of
darts and sing a few songs over his pint of beer goes down
to the local hotel bar on Skye to toss off his dram, follow
it with a pint of beer, and chaff his neighbors. "There is
nothing else to do." Skye exiles in Glasgow, and not only 275
the youngest of them, often complain about the lack of 167
opportunity for social intercourse at home. What they really 571
mean is that "there is nothing else to do" unless they do
not care about the reaction of their "people and friends."
Moreover, they may want to return some day to stay, and,
then, they will have to face the judgment of the old men in
their neighborhood.

Another contrast of the Welsh and the Sgiathanach can 52
be found in their respective attitudes towards gambling.
Traditionally, both enjoyed forms of recreation in which
competition plays a major part, but the Welshman today does
little gambling, implicitly because of his religious outlook.[27]
The Sgiathanach, too, is not an open gambler, but the football
pools find many interested individuals on the Misty Isle.
There was, for example, the deacon in one church who forgot he
had a meeting to attend. Much to his dismay, when another
member of the kirk stopped by to see why he was late, he was
busy filling out his football coupon. Dissimilarities, of 71
course, are not particularly significant. In both regions

[27] Ibid.

ons? Certainly not the kirk session. But since they 794
a common tradition, which is reinforced by interaction 795
tual respect, the elders impose more or less common 626
rds. The norms are the by-product of the history of
If there was cleavage, might not the behavior of the
begin to diverge? In Kilmuir there are three sects. 795
them have churches. The Church of Scotland is in the 796
ty. The Free Presbyterians are a definite minority;
k there is only one family of them. Although several
ers of the Church of Scotland have begun to follow
ample of the national church elsewhere in Scotland and
ate Christmas, at least on an appropriate Sunday,
is no Christmas in Kilmuir any more than there is in
le. The custom is said to be "popish." Naturally,
birth of Christ is not celebrated, his rebirth cannot
memorated at Easter. All churches, on the other hand,
ate New Years, which is also the traditional time to
ge gifts among members of the family. It is a time
ense. After midnight the people of the townships 796
ce "first footing." Until early in the morning, the [273]
make their rounds exchanging visits and toasting one
r and the New Year with whiskey, for the men, and wine,
e women. The people of Kilmuir are noted for their 571
relationships. "You have to watch what you say up 602
" I was told, "they're all relatives and friends of
ther."

he situation in Portree for the Sgiathanach is much the 400

icism is fundamental to the peoples' lives. A brief 785
ssion of the Sabbath will serve to conclude my discussion 796
ligion and to indicate some additional difficulties which 128
sgiathanach faces in his attempt to preserve his culture.
Sunday does not exist on Skye. There is the "Continental 796
y" and the Sabbath. On any other day of the week, the 576
ing is, "It's a fine day," or, more often, "It's a wet
The Sabbath, however, is "no day to be speaking of 576
" Keeping the Sabbath is almost a fetish among the
e. It is a readily observable test of an individual's
ious capacity. All unnecessary work, all unnecessary
, and all unnecessary thought is taboo. Only the
t minimum of worldly activities are permissible. This
not mean a day spent in idleness; the time should be
in public worship at the kirk, private spiritual con-
ation and family worship. The Skyeman's estimation of 183
comer may depend on his keeping the Sabbath. One man
ery surprised to learn how long a memory the people have
a man deviates from the expected. A visitor asked a
er what kind of a man a certain newcomer to Kilmuir
to which the crofter replied, "He's all right, except
ears ago he played the pipes on the Sabbath." Most
mers, including the few Catholics, respect the Sabbath.
No crofter would ever think of doing any work on this 461
eyond feeding his cattle as an act of mercy. After 231
of rain, the crop of oats or hay may be ready for 796 241
sting on the Sabbath, but he will not touch it. A man

796 may need just one more dry day to finish his harvest. If the
241 next day is the Sabbath, his one dry day may be two or three
weeks away and the hay a sodden heap. Nor did the Sgiathanach,
or any newcomer with a croft, change during the war despite
all the pleas of the government for full agricultural pro-
796 duction. This is the one time that the Older Order Amish
slogan "And be not conformed to this world" fully applies
to the island. Circumspect behavior on this day functions
to remind the people of all the negations and all the sanctions
which religion has bestowed on the culture.

178 As in the case of Communions, there has been a gradual
796 lessening of the importance of Sabbitarianism, especially
since the return of many young men and women from the war.
369 Again, the rather spontaneous relaxation of the rules is
most common in Portree. It does not have the encouragement
of the ministers of any church nor the elders of any church,
622 except the Church of Scotland. Thirty or forty years ago
the ministers and the lay kirk officers had enough influence
to stop the running of trains throughout the western Highlands,
shipping in the Western Isles, and the Kyle-Kyleakin ferry
482 on the Sabbath. Public transportation is still at a stand-
204 still on the first day of the week, but the Sunday papers
appear in Portree after the evening services, despite all the
efforts of the ministers. They come by car from Inverness, by
row boat across the strait, and by car to the village.

178 Before the war no one in Portree would let their
796 children out of the house, except to go to church with their
857

parents and to Sabbath school, nor would they allow children 178
to play games in the home. Today the children of the Church 796
of Scotland people are allowed to go for a walk, read, or 857
play games. Tourists, frequently, if not always, intolerant 484
of the strict Sabbath, have no doubt contributed to this 178
relaxation of taboos. Although a further development of the 796
tourist industry would be advantageous economically, tourists
are a threat not only to the Sabbath but also to the whole
religious complex. They set examples which the youth are
only too ready to emulate. Before the war every hotel on 485
the Island, including all in Portree, and every boarding 796
house posted notices requesting visitors to refrain from
using their cars for touring on the Sabbath. In many of the
guest homes the request was the equivalent of a warning of
removal. Today the signs are gone. Still not content, the
tourist agencies in England and the Lowlands continue to make
snide remarks in their literature, suggesting "a little more
tolerance is needed in certain quarters." The youth and some 178
adults of Portree now have begun to go off for a drive around 796
the island. One reason why the Sabbath is still strong in 484
Kilmuir and Glendale is that tourists are not accepted in
either district.

Strict Sabbath observance distinguishes three broad 796
groups on the Island. Portree is set apart from the crofters 565
by laxity, and the county people are set apart from the 349
crofters by using the day for visiting and having afternoon 571
teas together. The gentry, of course, are not under the

control of the "elect" crofters. They, are the "elect," 796
and their status is independent of the control of the vener- 565
able old men. 626
584

Summary

Whereas the culture of the Sgiathanach was oriented 771
around the clan system in the remote past and was intelli- 178
gible only by an awareness of the all-pervasive influence
of the clan, today congregational religion provides the
focus for the culture. If we are to understand the Sgiathanach 121
we must fathom his religion, that is, the interpretation
which he has given to Calvinism. Moreover, this highly 182
integrated and systematized aspect of his culture has pro- 771
vided the means for preserving cultural continuity. Economics
and social organization aid us in recognizing how cultural
continuity has been maintained. Religion puts at our finger
tips the how and the why.

The basic status values have held good because religion 771
has sanctioned them. The old men of the neighborhood have 554
been successful in sustaining their statuses and habits 183
through their position in the esoteric religious hierarchy. 626
By holding the father responsible for the spiritual welfare 593
of his family, and judging a man's spiritual enlightenment
on his renunciation of mundane pleasures as well as his
knowledge of religious tenets, the elders exercise judicial
and authoritarian functions. At the same time, the status 593
of the father within the family is strengthened. After a

man is no longer concerned with the necessity of having his 771
children baptized, the venerable old men, the family-head 554
elders, prolong their social control by sitting in judgment 183
on those who seek salvation. The strength of age controls 626
is indicated by the continued ability of the elders to resist 170
all attempts to introduce secular innovations to the crofting
neighborhoods. Even in Portree the majority of the people
are under the watchful eyes of the old men.

Many of the meaningful patterns of interaction are 771
religious. The rites of passage function to augment social 182
control, restore disturbed equilibriums, and establish new 626
ascribed statuses. The rites of intensification, including
those associated with death, function to restore disturbed
patterns of interaction in the family, nuclear and extended,
and the larger social groups and to establish meaningful
relationships when large congregations gather for the
celebration of communion. Religion for the majority is not 771
merely dependent on attending church on the Sabbath and 782
attending Wednesday night prayer meetings. Every day of
the week begins with a prayer and ends with family worship.
All social activity outside the home is ideally limited to 52
the church, and the church is never used for mundane activity.
Only in Portree are there a number of social activities to 349
tempt the people. Kilmuir has no more than a Crofters' 573
Club for men, and Glendale has no social activities, unless
one would include the annual meeting of the share holders
in the farm.

Although asceticism, epitomized in Sabbatarianism, is a marked characteristic of the expression of the Presbyterian ethic, it is not completely negative. It is one of the means for sustaining cultural continuity. Religion has centered on the home and family. It has preserved the Gaelic. There have been significant changes in the content of the culture, but by using asceticism as an observable test of spiritual enlightenment the limitations of the socio-economic life have been sanctioned. The form, the basic configuration, of the culture is still recognizable.

771 785 182 [178]

CHAPTER VIII

SUMMARY AND CONCLUSIONS

My intention in writing this present study has been to inquire whether or not marked population growth and decline is a criterion of cultural discontinuity. To this end we have spanned more than two centuries of the culture history of the Isle of Skye. As we proceeded from a description of the configuration of the culture as it was in the days of the clan, to a narration of the perpetuations and modifications of the content of the culture during four periods of the modern epoch, and finally to an account of the contemporary culture, we have been constantly aware of the swing of the population pendulum. Throughout this study I have attempted to analyze the available facts for evidence which would indicate not only cultural but also social disintegration. In this final chapter I shall draw the sundry threads of my running commentary together to support the aforesaid conclusion that population change is not a criterion of cultural discontinuity.

121 [128]

The Population Cycle

In as much as my purpose is to evaluate cultural continuity within the framework of population change, let me first briefly review the changing size and structure of the population.

[128]

Beginning with a population which is believed to have been relatively stable due to recurrent crises, including epidemics, famines, and wars, the pendulum of population growth and decline for the Sgiathanach has been found to be highly responsive to cultural innovations and social adjustments. Between 1750 and 1841 the Skyemen increased in numbers from 10,671 to 23,074, an increase of more than 100 percent. From 1851 to 1951 the population has steadily decreased from 22,536 to 8,603, a decrease of 62 percent from maximum. Associated with the decline were changes in the age structure. In 1861 34 percent of the population was under fifteen and only seven percent was over sixty-five; today only 22 percent of the population is under fifteen while 19 percent is over sixty-five. How can we account for these changes, or, more correctly, how can we account for the changes in the birth, death, and emigration rates?

161 161 162

Broadly speaking, the increase was favored by the direct and indirect involvement of the Sgiathanach in the process of commercialization, with all of its associated consequences. One by one, the natural checks on population growth declined in importance. The pressure on the means of subsistence was eased. The former clan chiefs, preferring the society of Edinburgh and London, absented themselves. After converting rents from kind to money, they provoked the withdrawal of the tacksmen by resorting to rackrenting. The former clansmen, who became joint-tenants, received a larger share in the land and were freed from the obligation of feeding both their own families and those of the superiors. At the same time the

161 161 175 178 161 175 178 427

acceptance of the potato, a much more productive and dependable subsistence item than grain on Skye, made it possible for more people to live on less land. The introduction of a new industry, kelping, provided many with employment and freed them from complete dependence on a subsistence economy. Vaccination reduced the mortality rate, especially among infants whose chances of reaching maturity and procreating were thus enhanced. Another important factor was the Skyeman's share in the general prosperity of British agriculturalists during the early years of the Industrial Revolution and during the Napoleonic Wars. An especially important factor was the practice of subdividing the land which made early marriage possible, in particular after the installation of the crofting system. Finally, but by no means least significant, there was the persistence of many typical features of the culture in the days of the clan. The sentimental ties of kinship and attachment to the soil had remained.

161 175 178 182 [423] [592]

The population decrease, partially a result of the Skyeman's involvement in the process of commercialization, was primarily a result of a failure to fully adjust to the higher, more heterogeneous socio-economic level. By the end of the second period of the modern epoch, 1845, the people had become hostages to the potato and their own fertility. When the potato failed them, they had nothing to fall back upon, except the generosity of their landlords. The cattle and kelp markets had collapsed at the end of the Wars, and the subdivided land could not produce sufficient grain. The belief of many that the population had over-run the limited local resources was confirmed.

161 175 178 184

Additional modifications have been found in the division 178 182
of labor. Although no Skyeman has shown a disposition to assume [162]
responsibility for domestic work, unless he lives alone, the
women of Skye are expected to function in roles which once were
filled exclusively by men. Old men and women for many years [561]
now have continued to perform tasks which formerly were their
duties as youths and young adults. These changes, like those
we have reviewed, are partially traceable to an incomplete
adjustment to the contractual, commercial world. This has led [162]
to striking alterations in the age structure of the population
for it is the youth who forsake the island and the aged who
yearn to return. Nevertheless, there have been no observable [554]
changes in the status system of the rural neighborhoods.
Primitive democracy, distinguished from our form of democracy 621
by the principle of unanimous consent rather than majority rule, 554 182
continues to operate in the townships. The existence of such
an institution implies a maximum of equality co-existing with
a minimum of authority. The continued ability of the crofters
to maintain primitive democracy in a nation like Great Britain
is possible only because there is a high degree of social
integration. The simple system of ranking, on the basis of [561]
age and sex, has persisted. Men are the social superiors of [562]
women; old men are the social superiors of their juniors. I
believe we shall understand how continuity of status has been
preserved if we turn to a consideration of the role of religion
on the island.

If I am right in asserting that a belief in clan brother- 178 182
hood was an all pervading cultural pattern in bygone days and 614

that the clan ceased to provide a focus for the culture almost 178 182
two centuries ago, the reader may ask how can a culture without 614
a focus find continuity, how can a culture without a central
theme, something around which to orient itself, achieve inte-
gration? Religion provides the answer. Congregational religion [771]
has taken the place of the clan.

The acceptance of the new religious focus curtailed 178
many traits and complexes characteristic of the old culture. 182 771
This is why the older folktales, songs and superstitions, the
festive celebrations held at times of birth, baptism, marriage,
and death, the traditional social patterns of visiting, and
all frivolous activities were abandoned or modified. In a
time of acute distress the Sgiathanach turned to religion
as a means of consolation. His religion required circumspect
behavior. Perhaps, the sheer impossibility of supporting the
traditional forms of social interaction had forced a change in
cultural content when the religious leaders placed these forms
under censure. I have suggested that religion did no more than
sanction poverty. This much is certain: religion provided the
means for the culture to maintain its continued distinctiveness.
The Scots of the Presbyterian image of the days of Knox, of [795]
the times of the Covenanters, and the year of the Glorious
Revolution continue to exert their influence on the Sgiathanach.
While the ministers and the venerable old men of the laity
stamped out all practices which they considered pagan or
Catholic, as well as modifying the social aspect of the culture,
the process was not completely negative. The religious expression

377

sanctioned the qualities which had given the people their characteristic strength of character. 178 182 771

The churches of Skye made conservatism an official policy in 1843, and in 1892 reaffirmed this policy. For well over 100 years religion has had a strength and vitality which has enabled the Skyeman to pass through times of extreme distress, not to mention chronic economic deficiencies. Among the most important religious sanctions are those which reinforce the status values of the culture. The father's status in the nuclear family was reaffirmed at a time when his socio-economic importance was declining. He has been held responsible for the spiritual welfare of his wife and children. The prestige of the old men, the family-head elders, and their control over the neighborhood group was similarly bolstered by making them the judges of a man's spiritual enlightenment. Spiritual enlightenment is weighed on a scale which will not balance unless a person's religious knowledge is matched by conformity to the ways the old men think a man should behave. Again we are not dealing with a completely negative attitude. In the place of frivolous amusements, religion has offered highly emotional, spiritual patterns of behavior. Religion has preserved the Gaelic language by using it in formal worship and within the home for family worship. In these and other ways religion has indeed enabled the culture to achieve a reorientation and maintain its continuity.

182 554 771 593 182 554 771 888 182 771 [181] [191]

How similar Skye is to the Old Order Amish in this respect.[3]

[3] Kollmorgen, Culture of a Contemporary Rural Community: The Older Order Amish of Lancaster County, Pennsylvania.

378

Both have remained devoted to the old tradition which is epitomized by their religion. Further, they are each bound together by a common language and vocation and by strong ties of consanguinity and affinity. Moreover, the Sgiathanach and the Amish have similarly rejected the deviant. On Skye emigration has affected all levels of social organization, the conjugal family, the extended family, the township, the neighborhood and village, and the community. Still the Amish and the Skyemen have maintained social and cultural integration. Standing in a contrasting position is the town of Landaff, New Hampshire.[4] Although Skye and Landaff have experienced similar trends, including an original ecological adaptation, disturbance resulting from population pressure, an unsuccessful attempt to meet the crisis through commercialization, and a chronic high rate of emigration, especially by the youth, Landaff has been described as an example of social instability and cultural disintegration.[5] The farmer of Landaff remained only as long as his interests were compatible with those of his neighbors, and local opportunities existed to satisfy his ambitions. He had no attachment for the land to offset the inadequacies of persistent economic limitations. He abandoned the associations which had supported the community by giving the group a sense of security.

182 771 [181] [167]

Like European peasants in general the Skye crofter has lost his former self-sufficiency and political autonomy, but he has retained a strong attachment for the land and its

[4] MacLeish and Young, Culture of a Contemporary Rural Community: Landaff, New Hampshire.

[5] Ibid., pp. 113-117

mbers of a society, become more or less numerous. Their 121
tegration is measured by their interaction, their degree
contact, and their ability to exercise social control over
members of the group. In short, social integration depends
the strength of the network of relations which binds the
oup together into an organized whole.

Cultures have been studied in an organization-disorgan-
ation framework,[1] and they have been appraised in an
ganization-readaptation framework.[2] The reported presence
absence of cultural disorganization, a disturbance of the
stematic structure, has depended on the theoretical position
the investigator. Although both approaches require a
nsideration of cultural stability and continuity, the con-
usions reached have depended upon whether or not the social
ientist is willing to look for higher levels of organ-
ation instead of using only the perspective of the culture
it supposedly existed in the past. Simple, isolated,
nship oriented cultures need not disappear when brought into
ntact with complex, contractual cultures. They can find a
adaptation. But if they fail to maintain a genuine degree
continuity, by placing a value on their heritage, they
sintegrate, the basic pattern becomes fragmented, and they
sappear.

Finally, the concept of anomie can be employed to
aluate social disorganization, and I believe that an absence

[1]Redfield, The Folk Culture of Yucatan.

[2]Lewis, Life in a Mexican Village; and Steward, Area
search, pp. 126-149.

of anomie is an additional support for my position. With 121
these theoretical assumptions in mind, we are prepared for
a final interpenetration of the culture of the Sgiathanach.

Evidence for Cultural Continuity

If I were to view the Isle of Skye from the single 178
perspective of the culture as it functioned two hundred years 182
ago, in an organization-disorganization framework, I might
logically argue that there is evidence for cultural disorgan-
ization. The clan system, which had pervaded all aspects
of the culture, was rendered inoperative by the intolerance
of the British government and the cupidity of the patriarchs.
Land tenure was divorced from considerations of reciprocal
dependence and real or fictitious kinship. The contractual
principles of the wider commercial society, in which the
landlords found a more satisfactory status, were introduced.
In time, the customary rights of the tacksmen, who had supported
the structure of the clan, and the former clansmen were
questioned and repudiated. The older folktales, songs, and
many of the superstitions were obliterated. The traditional
religious and secular festivities associated with events in the
life cycle were abandoned or allowed to survive in a much
modified form. The traditional customs of cooperating and
visiting were either altered or disregarded. The list of
traits and complexes which were dropped from the content of
the culture could be continued. It is, indeed, a long one,
and it includes elements from every aspect of the culture. If

I were to adapt this argument, I might even be convincing
my dissertation would have a fallacious conclusion. Emph
irreparable cultural disorganization is not a characteris
the culture history of Skye.

Continuity has been maintained through a reintegrat
In part, Skye has made an adjustment to the higher socio-
organization of Great Britain and Western Civilization.
phase of the culture's readaptation, however, is an incom
adjustment. The Sgiathanach has remained enisled geograp
and culturally. A readaptation has also been made in the
traditional culture.

The national culture has played no insignificant ro
the readaptation. Parliament turned back the process of
mercialization in 1886 and undertook to rechannel the tre
toward ever increasing commercialization of the land, ult
mately leading to the socialization of the land. The ess
the old system of land use and tenure were not only reaff
but also given legal sanction to insure their stability.
nation confirmed the customary usages. In many townships
in whole neighborhoods the crofting system was restored.
far as the Sgiathanach is concerned, he has never known a
other economic structure than communal use and tenure of
land. There are only three significant differences betwe
runrig farm, whether the farm was a tacksman's or the com
holding of several joint-tenants, and the crofting townsh
The arable acreage is held in compact, permanent blocks i
of dispersed and shifting strips; the crofter pays a mone
rent in place of goods in kind and services; and national

of tenure function to protect the individual from potential abuses by a landlord where customary usages once fulfilled the need. Moreover, even though the tenure of the cultivated soil grants all the rights of a landholder, including the rights to bequeath the house and land to a member of one's family, for more than half the year it is used communally.

The Sgiathanach has never adjusted sufficiently to become a specialist, not even a specialized grazier. For him the land has always had a more fundamental value than merely being a means of livelihood. It is the ancestral home. There is a sentimental attachment to the land which is an expression of the affectionate bonds of kinship. The people have never lost the tribal tie of the land and the group. Although the former patriarchs disclaimed any sympathy with this point of view, the landlords on Skye today have kept what little land they have only because of its sentimental value. Indeed the attitude of the largest landholder, the government of Scotland, is that the crofting tradition is worth while preserving, if for no other reason, because in the predominantly urban and industrial civilization it has a romantic value. There are other reasons. The Islands have long been looked upon as a human reservoir for the armed forces, and, more recently, for Lowland industry.

As a result of their partial adjustment to the higher socio-cultural level, there have been changes in crops and stock. The British market has influenced the crofters' output, within ecological limitations. The old subsistence crops of oats and

barley have been replaced by grass and hay. Conceivably, this is a more complete adjustment to the environment, which has been made possible by integration with a commercial economy, than an adjustment to the demands of the outside world. Whereas the objective of the local economy once was the export of cattle, today the purpose is the breeding of cattle and sheep for the national markets. We have seen that there are a host of limitations and difficulties in the economic aspect of the culture. Many of these are due to the persistence of conservative practices. Each crofter must keep pace with his tradition-practicing neighbors, with the old men of the township. Others are the result of an inhospitable environment. The economy does not run smoothly, but this is not conclusive evidence for disorganization. Integration does not mean smooth functioning. In the spring and autumn the crofter is confronted with a variety and succession of tasks which would fill a specialist with dismay. Very often, these pastoral and agricultural chores have to be carried on in conjunction with outside employment. In return for his labor, the crofter receives a meager income, frequently supplemented by contributions from his children or the government. As a further result of the partial adjustment to the wider society and culture, the people leave the island to seek employment and to achieve an upward mobility impossible on Skye. Economically, Skye, along with most of the Highlands, may be viewed as presenting a picture of the Lowlands of Scotland 200 years ago. That is the extent of the economic adaptation of the Sgiathanach to the national culture.

The growth of the population ended with a prolonged famine. 161
The proprietors, finding that the people's only justification [731]
for crowding the estates and looking to their landlords for [427]
help were some nebulous customary usages, facilitated the
decline by disregarding custom and throwing as much land into
sheep farming as was possible. While evictions were not new, [427]
only after the famine did they result in an absolute reduction
in numbers. The Sgiathanach, fettered by a lack of capital [182]
and an inability to break with the past, could not make the
final adjustment required by the process of commercialization,
specialization. In addition to emigration, the Clearances [167]
and general economic hardship forced a postponement of [582]
marriage. There was neither land nor regular employment to [464]
provide a livelihood.

Later in the nineteenth century new influences began 161
to play a role in the continuing decline of the population. 167
Following the passage of the Crofters' Act, the nature of 178
emigration changed. Seasonal migration became negligible. 427
The provisions of the Act, and ensuing legislation, made it 671
possible for a man to remain away during his active years and
return to the parental croft to spend his old age. The ex- [871]
tention of education not only equipped the youth for life in
the larger society but also created demands for objectives
which could not be attained at home under the existing order.
Thus, as in the period of population growth, the persistence of 161
many features of the old traditional culture, and the renewed 167
importance of others, were factors of no little consequence. 182

On the one hand, they stimulated emigration, because the only means of achieving upward mobility was through outward mobility. On the other hand they deterred a complete abandonment of a way of life which offered so few material rewards. This brings us face to face with the problem of cultural continuity. 161 167 182

Cultural Continuity on the Isle of Skye
A Restatement of Theoretical Considerations

In the opening chapter, I presented a series of theoretical assumptions on which I have based my analysis of the evidence for cultural continuity on the Isle of Skye. A review of my presuppositions and my approach to the problem may expedite my final quest for proof that marked population change is not a criterion of cultural discontinuity. 121

If society and culture are separate though complimentary concepts, cultural and social integration must be independent variables. They tend to find mutual expression, but they are not necessarily found together. Nor can they be measured by the same criteria. Cultures are considered integrated to the extent that their traits, complexes, patterns, and aspects are meaningful to the people. The content of all cultures is continually modified by the disappearance of once characteristic trait complexes and the addition of new ones. Old ways of doing things lose meaning and are disregarded; innovations find acceptance and are given meaning within the configuration of the culture. The form of the culture, its essential distinctiveness, persists. The carriers of a culture, or the

182 group.[6] He has maintained cultural integration and continu
771 At the same time his conservative religion has not gone qu
as far as the Amish Order.[7] The Sgiathanach has rejected o
those patterns which would disturb the equilibrium of life
[161] the neighborhood. The penalty for his failure to complete
adjust is depopulation; others, like the people of Yap and
Aleuts, are paying a similar penalty.[8]

Further Evidence for Cultural Continuity

121 Various approaches to the problem of cultural contin
can be attempted in addition to the historical approach wh
has formed the point of departure for my study. The most
would be a comparative study of two basically similar peop
the Welsh and the Irish. In the chapter entitled "The Set
and throughout this study I have called attention to the s
larities between the Skyeman, the Welshman,[9] and the Irishm
In a host of cultural features the three are strikingly id
Some of these common patterns may be remembered, for insta
the alien nature of nucleated villages, the strong patrili
emphasis, the importance of the old men, and a pastoral

ligious groups." As a result of urbanization almost all 171
ral areas have experienced the pangs of social mobility and 182
w have escaped unscathed from a clash with the economic 771
rces which impinge from the outside. This predisposes the 786
ople to the appeal of an emotional religion, revivalism. 781
equently, the sect becomes uncompromising and rejects the
tside world in an attempt to bolster group security. The
quence of events on Skye enables me to add that the sect
n also reject a great deal of the former content of the
lture. Be that as it may, the authors show how emotional [571]
ligious movements restore or replace meaningful patterns
interaction among groups whose social systems have deteri-
ated. Revivalism is a counter agent for anomie.

The first period of social and cultural disequilibrium 175
ich the Sgiathanach experienced may be placed in the first 178
lf of the nineteenth century, with a climax around 1840. 771
paraphrase Loomis and Beegle, it was no mere coincidence 786
at an emotional religious movement should have appeared and 182
und so many converts. The closing years of the eighteenth
entury had witnessed numerous changes in the content of the
lture and the collapse of the old social heirarchy. While
ese events doubtlessly had an influence on all levels of
e society, it was not until the turn of the century that
ey broke forth upon the masses. Within a decade a revival
d reached effective proportions. This was a time of estate
organization. The tacksmen, the traditional leaders, were
ickly disappearing. The runrig farm was being abolished.
heep were beginning to replace men in one parish (Bracadale).

We know these and the other changes of this period. Significantly, 175
however, there was no simple correlation of revivalism and 178
population change. The Revival began during a time of population 182
growth and emigration; it reached effective proportions during 771
a period when emigration seems to have almost stopped; and it 786
found its culmination during years marked by destitution and
the beginning of depopulation. No purpose will be served by
repeating what I have already said about the nature of the
changes which accompanied the coming of the dynamic, evangelical
message. It is sufficient to emphasize that the ministers
and the Men reinforced the desirable fabric of the culture
and gave the culture a new focus.

The second period of anomie on Skye is less well marked.
It appeared at the end of the "Clearances." Again destitution
gripped the island. Although the vital, emotional religion
had enabled the people to bear the hardships of the "Clearances"
without overt resistance, they now openly defied the landlords
and the state. More than a series of government commissions
and committees came to Skye. A still more intense religion
loomed on the horizon to reaffirm the focus of the culture.
Once again it was no mere coincidence that the new church should
have found ready acceptance by the people in the areas of
greatest unrest, the areas which required the presence of
police and Royal Marines. It was a fact of no little signifi-
cance that the new denomination should have been founded on
the Isle of Skye, the area of greatest unrest in all the
Highlands.

Whatever signs there were of social or cultural dis- 175
organization, or threatened disintegration, in the nineteenth 178
century they have disappeared. Steward's theory that folk 182
societies do not entirely disappear but are rather modified 771
by way of a readaptation to the higher level of socio-cultural 786
organization of which they become a part is borne out by the 121
evidence from the Isle of Skye.[17] At the same time, on the
basis of events in the culture history of the Sgiathanach,
I would qualify his theory by introducing a new condition.
Isolated, relatively simple, kinship oriented societies and
cultures which must achieve a reintegration if they are to
preserve their continuity readapt, not only to the higher
socio-cultural level, but also to the older way of life.

In conclusion, I regard Skye as a community which has 178
maintained a continuity of culture despite marked population 182
change. The continued distinctiveness has been made possible [161]
by a reintegration of the culture and a restoration of the [571]
network of relationships which make for harmonious living
together. As in any socio-cultural group which has passed
through periods of threatened disintegration, the joints of
repair may be weak. Conflicts are tending to appear. The
crofter, who has refused to fully adapt to commercialism,
is seasonally faced with a variety and succession of tasks
which no agriculturalist in the wider society would tolerate.
There is the desire of the youth, who are too few in numbers
to form a sodality, for a share in the mundane pleasures of

---

[17] Steward, Area Research, p. 111; see also Wagley and Harris, op. cit., p. 441.

the world. So far, rather than having an influence on the 178
norms of behavior, the youth have been faced with the decision 182
to conform or leave. Cultural continuity on Skye has been a sad experience for many and an expensive proposition for the government. The youth leave; the aged return. If additional changes are forced upon the culture, and there is no doubt in my mind that they will be, the culture and society may not be able to preserve the delicate warp and woof. The threads already hanging loose may unravel the basic fabric. Only time will tell.

At the present time, the culture is disturbing to many 181
people. The sentimentalists in the Lowlands worry about the loss of the old songs and the decay of the informal ceilidh. Agricultural economists commonly look upon the crofting system with dismay. Ministers, some of them born Skyemen, express a dislike for the form which religion takes among the Sgiathanach. Well meaning agencies are determined to create an "adequate social organization" by bringing a share of the urban recreational facilities to Skye. Government commissions and agencies take a dim view of a system of tenure which allows the aged and the absentee to hold on to the land. They advocate the severance of the house and croft and a modification of the crofter's security of tenure. If one or more of these changes are made, it may no longer be possible to conclude that the culture is growing old with the aging population. I do not believe that the culture will ever fully adjust to the national socio-cultural organization. Before it will do so, the Gael

will have made his final retreat from one of his last outposts. 181
The belief of an old minister in Glasgow, a Sgiathanach who serves his fellow exiles, that "the Gael wants out" will be confirmed.

We have now finished our exploration of the thesis 121
that marked population change is not a criterion for cultural discontinuity. If my arguments have not been convincing, I shall feel very much like another minister who served the Sgiathanach as best he could. When his worn and torn Bible fell from the pulpit during his sermon one Sabbath many years ago, he looked down at his congregation and said, "I have spent myself and my Bible on you, and you are still not converted."

a disorganized society has the following characteristics: 121
a deterioration of the traditional patterns of interaction within the group, a low degree of social contact among the members of the group, and a loss of social control by the group over the individual members.[13] As a result, the individual is faced with a situation in which the norms of behavior and the sanctions for them become less common and clear. To restate 121 182
my position, although cultural and social integration are independent variables, the absence of this condition of normlessness is evidence that the cultural disruptions of the past have, in each case, been followed by a reintegration within the culture, as well as within the society. In other words, if the norms and sanctions are common and clear and are those of a single tradition, the absence of anomie means the individuals, as an organized aggregate bound together by a network of relationships and a sense of belongingness, are fully enculturated. Moreover, it means the culture, the socially transmitted attitudes, behavior patterns, and techniques which are distributed among the members of the society in accordance with their status positions and sub-group memberships, has maintained continuity. In order to investigate the question of anomie, let us compare my evidence from Skye with the findings of several social scientists who have worked with this concept.

Homans has used Durkheim's theory to analyze a small 171 182
New Hampshire hill farming community.[14] Hilltown, like its

[13] Durkheim, Le Suicide, pp. 272-282.

[14] Homans, The Human Group, pp. 336-367.

neighbor, Landaff, shares many features which have been found 171
to characterize the Isle of Skye. These include a similar 182
population cycle; a religion which is Calvinistic in tone; a period of religious schism; and original dependence on a subsistence economy. There are, of course, significant cultural differences between the two. The most important of these are the presence of English institutions of town government in Hilltown; the fact that the original settlers were individual nuclear families who were relatively free to develop their own reciprocal patterns without the limitations which long standing tradition might have imposed; and the "Yankee" lack of traditional attachment to the land. Obviously, it should not be forgotten that the one is a town and the other a much larger community.

Using an historical approach similar to my approach to the Sgiathanach, Homans traced the path of what he calls "community disintegration" and reached a number of conclusions about anomie. His first conclusion is that the number and strength of the sentiments that led the members of the group to collaborate had declined. There was a decrease in the number of activities that the individuals carried on together. Need for social self-sufficiency and mutual aid lessened. Schism disrupted the church. The town meeting ceased to be important. In short, the interests of the people were outside the town. His second conclusion is that there had been a decrease in the frequency of interaction in the internal sphere of activity. There was less visiting and fewer parties. Some people, especially members of the upper class, seldom saw anyone,

other than on business. The fraternal orders were gone. 171
Church attendance had become sparse and irregular. These 182
changes led to a decline in the strength of interpersonal sentiments and a feeling of indifference toward one another. His third conclusion is that these changes were followed by a "decline in the extent to which norms are common and clear." Since class membership is defined on the basis of interaction, class activities are much alike, and the interests of class members coincide. Ranking is based upon norms, in particular the status and role of leadership in community affairs. A decrease in community activity had resulted in a weakening of both norms and ranking. His last conclusion is that the changes in the intensity of everyday relationships have led to a loss of social control by the group over its members. Deviations were not punished by avoidance. All action was left to the state. Here, then, is anomie. Let us compare the contemporary behavior patterns of the Sgiathanach with the Hilltowners.

There is evidence that the Sgiathanach no longer collabo- 178
rates in group activities as much as he once did. There has 182
been a decline in the amount of cooperation in the work of crofting. In many activities, of course, the need has disappeared. The individual family can easily perform many of the tasks, such as the ploughing of a few acres of land. In some townships it has become the practice to pay the sheep club stock shareholders to insure the presence of enough men and women to handle the dippings and shearings. In others,

including almost all with private flocks, the crofters continue 178
to cooperate. The church has been broken by schism, not once 182
but four times. On Skye, however, the schisms have had as 795
their purpose conservatism, not greater leniency as in Hilltown. 182
Moreover, the schisms have been solidifying factors. The progressively more dynamic world denying sects, after a period of communal strife, have given the people an emotional unity. The crofters have become dependent on the trade-center village 182
and the wider national markets. Many must seek employment beyond the island. The interests of the Sgiathanach are not outside the neighborhood, except in so far as events from the outside affect them and, especially, to the extent that ties of kinship and religious brotherhood reach beyond the local group. We are hardly talking about the same situation as Homans. As we continue to explore this condition we may also ask has there been a decline in the frequency of interaction in the internal sphere of activity?

The old ceilidh has disappeared under clerical bann, but 182
it has been replaced by "going to have a crack," going to visit 571
and gossip with one's friends and "people." The people may 178
no longer gather to hear the old men tell stories of clan battles. They now discuss the latest local gossip and the news of the outside world. The Islander has never been given to formal [575]
social organizations; they half distrust such orders as the Masons and Eastern Star. Still there are chapters of both in Portree. In the crofting neighborhoods face to face relationships continue to preserve strong interpersonal sentiments. The [203]
postman's van and the grocer's trucks have relieved the people

from the necessity of daily calls at the post office and shop, 182
but the drivers serve the function of passing on the news of the 571
day at each stop. 203

Standing in the place of many of the traditional social 182
outlets which have disappeared or been modified, there are the 794
religious occasions for joining together as a small group. We have found the Sgiathanach to be very religious. Everyone is [794]
expected to go to church on the Sabbath, and everyone goes to church. Irregular attendance soon becomes noticed by one's neighbors, the kirk elders, and the minister. Concern over [626]
what one's neighbors may think, in itself a strong motivating factor, is reinforced by a forbidding fear of what the venerable old men may do whenever an opportunity presents itself. There are Wednesday night prayer meetings for further social intercourse. Above all, there are the semi-annual Communions which, 182
except in Sleat and Strath and one Bracadale sect, bring to- 794
gether the people of the kirk, the members of the same sect from 796
other neighborhoods, and affiliates of the denomination from the mainland. Even the adherent, the individual who has not experienced a saving change because he is not old enough, normally takes his vacation, if he is employed, at the time of the Communions in order to attend.

The decline in interpersonal religious strife does not 182
mean that strong personal sentiments are not present. No one, 571
other than the eccentric, is indifferent to his neighbors or 243
others with whom he may have dealings. The crofter and his [646]
village cousin may not bother to vote, but they closely watch [666]
and freely discuss their representatives. Gossip has retained

a tremendous strength. There are villagers who dislike the 182
crofters, but few would intentionally slight an old crofter's 571
wife because it might give her something to talk about. I 703
shall elaborate this point shortly when I come to social control.

If there had been a decrease in the frequency of inter- 182
action, the traditional norms and sanctions should have become 554
less common and clear. In particular, social ranking based 565
on leadership in communal activities should have become less [571]
definite. Although anomie, as used by Homans, is an internal condition, I shall introduce a consideration of cross-group norms in order to present a clearer picture of the status system. Despite the extreme fluidity between the county people and the members of the intermediate social heirarchy in informal clique groups, such as the bridge club, there has been no tendency to obscure the lines of cleavage. The class structure, in terms of the whole community, has remained rigid. The county people are at the apex of the prestige status and class hierarchy. They are, of course, members of a group which extends across the length and breadth of Great Britain. In any neighborhood where there is a member of the landed gentry resident, he is always looked to for leadership. In Glendale, a privately owned neighborhood, a nearby landlord is their political spokesman. In Portree the gentry have done more than uphold social ranking based on leadership; they have created and introduced new activities in which they express their role. These are the Skye Council of Social Service, the village council, and the Old People's Welfare Committee. They may be aided by others, but their decisions are the others to be followed. The gentry

maintain their position by intermarriage, by educating their 182
children in England, and by interacting with people of similar 571
status within the community and beyond. 554
565

The crofters continue to stand at the opposite pole. They seldom achieve status within their neighborhood. Upward mobility is possible only through outward mobility. Leadership fails to find expression among them in the township or the neighborhood. The rare exception is the crofter's son who becomes a [715]
minister and returns to lead his people spiritually. When the [794]
crofters must select a leader, from their own number, the status is accorded to an elder of the church. The elder [794]
already has high status because of his advanced age and his position in the kirk. As I have said, the continued operation of primitive democracy means a minimum of authority and a maximum of equality.

The intermediate group in the social hierarchy cannot be 182
profitably used in this discussion. They are primarily newcomers. 554
people from the Lowlands or England, who have joined with the 565
relatively few Skyemen who have left the croft. Sufficient time 167
has not elapsed for a class oriented structure to emerge. Then, too, they are not a numerous group. Still, status is important in the village. As in the crofting neighborhood, ministers, doctors, and teachers achieve high status through their occupation. For the remainder of the population of Portree, status depends more on personal qualities and outside activities, especially in the kirk, than on the way one may make his living.

While we are on the topic of status and ranking, let us 121
554

see what Linton, the most explicit exponent of the concept of 121
status and role, has to say about societies which are faced with 554
changing conditions and disorganization.[15] Linton believes that such societies attempt to develop new social patterns by allowing individual initiative, thought, and competition free rein. They are characterized by a wealth of achievable statuses. With adjustment, ascribed statuses again become common. The con- 554
clusion seems inescapable that Skye has adjusted. Perhaps a 626
few additional illustrations will make my point clearer. The crofter who assumes a role of leadership is regarded as an eccentric, someone to poke fun at no less than the village idiot. The crofters' children who find their status too con- 554
fining must leave the island to achieve status. Some succeed, 626
to a limited degree, by moving to Portree, but they are never 167
free of suspicion. Since the majority of achieved statuses on Skye are left to newcomers, it might be said that the Sgiathanach has selected place of birth as a means to ascribe status. Not infrequently the newcomer's acceptance is followed by his being placed in roles of responsibility in both formal organizations and informal groups. The reader may remember the case of the young man from the East Coast who found himself on no less than eleven committees. In Kilmuir the people are represented on the County Council by a minister and the Crofters' Club is run by the school teacher.

I believe that the most important feature of the concept 626
of anomie is the loss of social control which is said to follow 182

[15] Linton, The Study of Man, pp. 113-131.

disequilibrium. I find it difficult to understand how any 626
group could have a low rate of interaction without a loss of 182
social control. Conversely, I feel that it is all but inconceivable that a group could continue to exercise social control without a high frequency of face to face contact. On Skye social control is a very potent factor. Gossip is a double edged weapon. It not only continues to enforce acceptance of the traditional norms by the Sgiathanach and, to a lesser extent, the newcomer but also can be used to punish the deviant. People have been known to leave the island after [167]
a deviation which rendered them inacceptable. Gossip became a source of misery from which there was no escape other than flight. Exactly how powerful the dread of gossip is in Portree can be judged from the experience of my wife and myself. We have played chaperons to people much our superiors in age. Nor can one escape gossip by secrecy. The person who remains a mystery is rejected as a deviant.

The amount and influence of social control, of course, 626
depends on the values of the Sgiathanach. Poaching is rather 685
good sport, but the theft of stock is a serious offense. The one is the concern of the police and the justices of the peace; the other is a matter which the people prefer to handle themselves. It is quite wrong to burgle a home, but theft from a shop is a different matter, especially when the store is owned by a Lowland corporation. A similar dichotomy applies 684
in the case of illicit sexual activities. A pattern has 626
evolved to protect the unwed mother, but the married man or woman who violates the taboo is severely censured. Ideally, the offender is cast out by the community and his spouse, or

else the spouse is likely to lose status. 626
684

The most powerful of all agents for social control are 626
the old men of the neighborhood. Through their position in 682
the church, a religious sanction for their prestige status, [794]
they enforce conformity to the norms of behavior which religion has sanctioned either positively or negatively. No one, nor any group, has been successful in questioning the right of these venerable men to maintain their habits and statuses which have been preserved over the generations. The baptism of a man's children and his own salvation depends on acceptance of the authority of the elders, for they will be his judges.

As far as the contemporary scene is concerned, there 182
is no anomie. The content of the culture has been greatly 178
modified, but the form, the underlying distinctive pattern, has been preserved. We are dealing with a single tradition in which the norms of behavior and the sanctions for them have remained common and clear. This is all the more striking because there have been periods in which cultural and social disintegration threatened to overwhelm the Sgiathanach. This brings us back to the role of religion in preserving cultural continuity.

Loomis and Beegle have employed Durkheim's theory to 171
analyze the growth and spread of fundamentalist religious 182
sects in contemporary United States.[16] They conclude: "It 771
is no mere coincidence that various types of emotional 786
religious sects are now among the most rapidly expanding 781

[16] Loomis and Beegle, Rural Social Systems, pp. 401-407.

ltural economy. Some may share my feeling that a 121
r exploration of these similarities would reveal evidence
tive of cultural continuity. We have three peoples who
ad ample opportunity for divergence and yet have retained
ssentials of Celtic culture. Moreover, all have been
population since the middle of the last century. Un-
ately, at the present time, I am not prepared to extend
omparative approach. I am detered by a recognition of
cts.[11] First there is the difficulty that peasant peoples
er the world seem very similar despite their distinctive
al and historical backgrounds. There is, of course,
ity within similarity. Second there is the truism that
igher socio-cultural level of which the peasant is a
influences the form peasant life may take.[12] Although
-Saxon and Norman influence impinged on the Welsh several
ies before it seriously threatened the Irish and Skyemen,
hree groups have been subjected to basically similar
li for several hundred years.

Another question which may be asked is, has the culture 121
nued to provide meaningful patterns of interaction for [182]
riathanach? One means of answering this question is
ded by Durkheim's theory of anomie. According to Durkheim,

427 656 croft by subdivision, he would pay little, indirectly and by arrangement; while if he simply built a hut or house on a vacant spot he paid neither rates nor rent. Either course was illegal; yet it was too expensive for the landlord, however 'hard-hearted', to take legal proceedings to turn off a squatter. As for wholesale expropriation the suffering caused and the odium incurred would have involved—and would still involve—both landlord and State in insurmountable difficulties by starting fresh agitation, perhaps with outbreaks of law-breaking, repression and bad blood. Yet these anomalies still discourage, and the normal illegalities demoralise, all concerned.

656 178 511 Because of the provision by State and local authorities of a growing range of services in other regions, and also because of the special reasons of Insular poverty, State action was increasingly taken in the Isles. To what extent have the Islanders responded, it may be asked; or how ● 12 far may they have failed, in return for aid offered and (476) benefits received? Let us begin with mutual aid practised among the people up to 1900, and then consider the repayment of loans and grants under different conditions. Observations by those in touch with the Island for many years, officially or privately, allow one to read between the lines and attempt an impartial judgment.

175 476 (657) As to the strength of independent mutual aid there could be no doubt. Up to the beginning of this century, the amounts expended on parish relief were 'almost nothing', and had shown no increase in preceding years. General poverty, anomalies in the rating system, and the mistakes such as the erection of poorhouses by the central administration, diminished resources; but the people generously gave help to their poorer neighbours in work and gifts. Except for a year of overwhelming crisis,

Chapter 1

INTRODUCTION

648 (014) Scottish crofting townships in the Outer Hebrides, in which I did anthropological fieldwork for fourteen months in 1970-71, participate extensively in the political, educational, economic and administrative 181 systems of larger British society. Despite this participation, the township presents various anomalous features, i.e., features which are inconsistent with what we would expect given our conceptions of the conditions of a modern, urban-industrial nation-state. The expectation that township members will manifest values and beliefs congruent with those prevalent in larger British society, and that patterns of economic specialization and individualization will be found among persons working in the available industries, is not fulfilled. Crofters continue to work small plots of land and engage in communal township activities even while employed by large industrial firms. Distinct patterns of value and belief persist, and are evident even in the use of new ideas and material goods.

●121 This thesis attempts to describe and interpret the seemingly anomalous survival of crofting and crofting

● 121 communities. The township is described as a "social boundary system (Cohen 1969)." The maintenance of firm boundedness under modern (urban-industrial) conditions is examined and related to economic and religious conditions and the status of the Gaelic-speaking population as a minority group vis-à-vis the larger society. Changes which have occurred over the past 100 years in the social boundary system of the township are examined by using the concept of "strategy."

Various authors (cf. Barth 1963, 1967, 1969; Brox 1968; Paine 1965 and n.d.) have used the concept of strategy to describe sociocultural change in communities which are marginal to and dependent on larger industrialized societies. A strategy may be defined as a pattern of choice-making in an environment characterized by various constraints and incentives. According to Barth (1963: 7),

> Statistical regularities or patterns in the behaviour of a population, as well as institutionalised patterns (i.e. the general acceptance of the expected patterns), may be expected to result where a set of external factors limit choice and in conjunction with a certain set of evaluations define clear strategic optima. Or put differently, where many persons act in a similar manner one may expect that they agree on certain relevant evaluations and regard their own behaviour under the prevailing circumstances to be optimal in terms of these evaluations.

This is not to say that features of sociocultural organization are caused by the free decision-making of

●121 individuals; rather, causal primacy in human action is given to the sociocultural environment, which determines what choices are available to be made and what behavior is valued. Because the exercise of choice is a human universal, i.e., a constant, it cannot be used to explain variation (cf. Barth 1966).

Actors within a community which is marginal to a larger industrial society make choices within an environment characterized by constraints and incentives which derive from both the local sociocultural system and the larger system. The state of boundedness of the local system is maintained or modified as a result of the strategies adopted by its members. I have suggested that the Scottish crofting township persists as a relatively strongly bounded system not because it is inherently static, isolated, or resistive of change, but because of the constraints and incentives stemming from the larger society. For example, the (657) British government has provided various incentives to (199) encourage the persistence of crofting and township (554) communalism; and to a certain extent, Gaelic speech or English spoken with a "Hielan'" (Highland) accent constitute social stigma (Goffman 1963) by which a person from the Highlands and Islands is assigned a somewhat lower social status in British social structure.

Chapter 4

THE TOWNSHIP AS SOCIAL BOUNDARY SYSTEM

A. Social Boundary System

121

Cohen (1969) has developed the concept of social boundary system, which I have found useful in investigating the sociocultural organization of the village of Shawbost, which has undergone major economic changes.

A social boundary system is a "network of social relations of people who are required and permitted to engage in a sphere of social activity (Cohen 1969: 104)." Within a society, a number of networks may be delineated, such as family, household, work group, community, and nation. Various spheres of social activity may also be delineated, such as educational, political and religious. The activities within these spheres may be performed in different networks. Persons in all societies are born into a kinship network, for example, and acquire expectations regarding rights and obligations vis-à-vis their kinsmen. However, the importance of kinsmen and the kinship network varies across societies, and within a particular society at different times in its history. Certain networks which were once very important may be

121 replaced in importance by other networks. Cohen draws upon Vogel's (1963) description of the middle class in modern Japan to illustrate changes in the importance of particular networks. Vogel demonstrates that the male work group has become an important network in present-day urban life in Japan, and that the previously important religious and kinship networks have declined in significance. With the rise of modern Japan as a nation-state, local communities have become less firmly bounded, and the work group has become a firmly bounded system.

A society may be characterized by the extent to which various networks of social relations within it are differentiated. This differentiation is a feature of sociocultural evolution, "an adaptation in the organization of social relations to the harnessing of increasingly effective energy systems (Cohen 1969: 105)." A network of social relations becomes firmly bounded when it is differentiated from other networks but is itself internally undifferentiated; role transposability and consensus are evident within the firmly bounded network.

A network of social relations is differentiated from other networks when role performance within it is independent of role performance in other networks (for example, in most urban-industrial societies, the role which a person plays in his family does not affect the

121 role which he plays in his work group). Another indication of differentiation is the inability of members of one network to substitute for members of other networks in carrying out various activities (as reflected, for example, in the existence of specialists who earn their living by performing these activities. In some societies, for example, all members of the society are responsible for educating the children of that society. In other societies, occupational specialists earn their living by such an activity).

Within a firmly bounded network, members can substitute for each other and assume each other's roles. Such role transposability is evident in the "joint conjugal relationship" which Bott (1957) describes among certain families in London, in which husband and wife may substitute for each other in carrying out household tasks. In contrast, a weakly bounded network exists in the "segregated role relationship," in which husband and wife perform different tasks and have separate interests and activities; such a relationship is found in lower-class families who depend on extra-household kinsmen for aid (Bott 1957: 52-96).

A network of social relations is firmly bounded to the extent that dissent within the network is not tolerated, that is, to the extent that consensus is

121 maintained. Cohen (1969: 110) relates this emphasis on consensus to role transposability: "...sustained outspoken dissent among members of the network tends to define them as unlike each other and thus to make it difficult for them to substitute for each other in role performance." Allied with intolerance of dissent is the tendency to exclude external influences. Firm boundedness of a network is also indicated by the existence of rites of passage which govern admission to the network, and by the existence of other means by which persons and influences are excluded from the network.

A firmly bounded network competes with subsystems within it. For example, a community which has the characteristics of a firmly bounded system competes with kin groups, marital networks and strong friendships within it. It also competes with larger networks that serve the functions that are the same as those of the community, such as the maintenance of social order and the regulation of change. For example, a strongly bounded local community will conflict with a nation-state (cf. Cohen 1969: 111-117).

121 128 In the following pages, the sociocultural organization of a rural Scottish township is described, and the changing characteristics of the township as social boundary system are discussed in relation to changing economic circumstances. Chapter 5 concerns the relationship

121 128 of the township with the larger society, and examines the effect of geographical and social marginality on the boundedness of the township network. Chapter 6 discusses two important networks of social relations within the township.

B. Township as Social Boundary System

632 178 62 The township constitutes a relatively firmly bounde system, although its boundaries are weaker than formerly when the township was relatively self-sufficient

[476] economically. Township members worked together in small fishing crews, and families relied on each other for help when members of the family were away from the islan "at the fishing."

62 476 602 [539] [605] Relatives were expected to give priority to helping each other. According to one proverb, "A relative is your best friend." First and second cousins were considered especially close, but knowledge of one's kinsmen extended to at least the fourth generation.

602 576 585 764 [539] Ties of kinship became evident in ceremonies such as funerals and weddings. One Gaelic proverb says, "You know who your relatives are at weddings and funerals." At weddings the onus was on the members of the bridal party to remember their relatives. "You have to sit and calculate who is closely related, and all those

12

182 government bodies and industries in cities on the mainland, rather than being relatively self-sufficient as it was at a previous time. The periodic return of [166] [181] relatives to the island reflects this peripheralness, as do feelings of inferiority among the islands. The island has become not only geographically but socially marginal.

A. Geographical Marginality

Geographical marginality refers to the distance of ● 121 131 182 the islanders from various economic and administrative centers on which they depend. Because they are distant, they are more likely to suffer breaks in channels of communication with these centers, as when storms prevent boats from docking. They are "marginal" because they depend on central sources rather than being self-contained; and the difficulties entailed in this marginality encourage the retention of techniques and patterns of interaction derived from the days of relative self-sufficiency. The anomalous combinations of old and new found in the township may be attributed to such marginality.

121 A "strategy" may be thought of as a pattern of behavior which develops in a particular history of reinforcement, the parameters of this reinforcement

● 121 being determined by conditions of culture, such as 121 political and economic conditions. Under conditions 178 of gradual centralization of economic and political 182 systems, the geographically marginal crofting areas have evolved strategies, some of which puzzle agencies concerned with development or other aspects of governmental process.

178 Before the North of Scotland Hydro-Electric Board 365 began to operate in the crofting counties, not more 511 than one croft in every hundred had electricity; but by the end of 1951, one in every six holdings had been supplied (Taylor 1954: 20). "The light" came to [354] Shawbost in 1951. Before then, the islanders used [177] Tilley lamps, a Canadian invention; and before then, [312] double-wick paraffin lamps. Piped water came a few [464] years later, around 1955; it was brought from a nearby loch, and the construction work gave temporary jobs to local people. The availability of these services [344] facilitated the building of county council houses, [342] which many welcomed as providing a relief to the congestion caused in part by rules against building more than one house on a croft. But, paradoxically, [651] with larger, better homes and all these services came a decrease in the advantages of living in a crofting township: property was assessed and people began paying rates or taxes.

Chapter 7

Conclusions:

Summary and Theoretical Considerations

A. Summary

105 Crofting townships of the Highlands and Islands of
[131] Scotland are within a few hours' travel of the major cities
[484] of Britain. An extremely high percentage of the young
[873] people in the crofting counties attend universities and
other institutions of higher education. Politically,
[641] administratively, economically and in other ways, the
crofting population participates in the larger urban-
industrial society of Britain.

105 Despite this participation, the township-qua-village-
632 community is a relatively strongly bounded system. This
621 thesis investigates factors contributing to the strong
• [121] boundedness. From a relatively self-sufficient economic
105 unit using agricultural practices suited to the extensive
178 cultivation of marginal land by smallholders, the township
632 has during recent decades changed to one dependent on
241 goods and services provided by the larger society.
105 Crofting activities nevertheless persist, in part because
241 of the incentives offered by government bodies such as the
654 Crofters Commission and the Department of Agriculture. The

105 The Harris Tweed industry is lauded as an
241 industry which is compatible with crofting. Because
188 weavers are self-employed, they can set their own schedule
632 of work and thus continue to participate in croft work
and fulfill various township obligations. The effects
• [121] of this industry on the township as a social boundary
[434] system were investigated. The income available from
[463] weaving is unpredictable, which encourages the retention
of crofting practices and other patterns of behavior,
such as "occupational pluralism," that were found to be
[476] adaptive in the past. Such strategies also strengthen
[182] township boundaries; for example, they encourage mutual
[434] aid and communal township practices. But weaving also
[407] offers a high level of income; and some weavers, preferring
to spend most of their time weaving, have neglected
crofting, or have invested in tractors or other motorized
transport which enables them to harvest crops, cut peat
and perform other activities independent of other township
members.

105 The fundamentalist Free Church constitutes an important
621 boundary-maintaining mechanism, serving to exclude various
795 external influences of the larger society from the township.
632 However, a smaller network of persons engaged in the
184 religious sphere of social activity, a subsystem within
105 the township system, also exists which has the appearance
794 of a firmly bounded system. These are members of the clique
621
632
184

105 is nevertheless strong today. The relatively
632 boundedness derives from a number of factors.
621 among these are economic adaptations to modern
184 which consist in part of the retention in modi
of traditional economic activities in response
constraints and incentives presented by larger
society. Also important are institutionalized
affect, particularly of kinship and community,
of religious affiliation and identification.
continue to be functionally important in part
the geographical and social marginality of the
township. This combination of factors has re
the persistence of a relatively strongly bound
which retains distinctive features in an exter
urbanized and industrialized nation.

B. Theoretical Considerations

• 121 In the United States, the concept of "pea
provided the main conceptual tool by which ru
ties which are structurally integrated with th
nation-state may be studied (cf. Foster 1967,
[632] The Scottish crofting township has some of the
[621] istics of a closed corporate peasant communit
but it is difficult to apply the word "peasant
000 community. Cultivation for subsistence is mi

174 The historical aspect of these regional facts is extremely
184 significant to the evolution of Scots social life, and to
179 developments of Presbyterian worship led by Elders in
55 ferm-toun and Kirk; although suggested by comparisons
128 throughout this book, they have still to be seriously followed
● 121 out. As to the future, regrouping of our somewhat
185 scattered agricultural population has been strongly urged in planning for post-war housing and community life. But sound planning must be based on survey, long overdue; though elementary, this key map appears to be the first of its kind for Scotland (Fig. 2). It is from these units of farm-team and township that Scots rural society must be rebuilt, region by region.

184 One further contrast between the farming and the
241 crofting communities demands attention: it lies in the
361 types of migration—one is tempted to say, of semi-
166 nomadism. Crofters, though they move to and from their croft and township—to the city, the sea, or the New World —return home to their native township when they can, and to no other. Many farm servants, on the other hand, though they usually spend their lives in the county or region of their birth, have been on the move from farm to farm, year after year. What is true of Lowland Scotland seems rather true of North-east England, but not of 'the
[464] English Plain'. Unmarried Scots farm servants were hired for the half-year, and frequently moved after each new hiring, the married once a year. Families were annually uprooted—if indeed they could be said to strike root at all!
[722] The war-time 'Standstill' Order for Scotland began to
[178] check this migratory life; but its effects remain. Hence many men have few ties, their wives still fewer. The children could not grow up with their schoolmates: they could look back to no "Auld Lang Syne", of which the

CHAPTER V

FAMILY, FARM GROUP AND TOWNSHIP: THE CONTINUING COMMUNITY AND ITS SOCIAL ECONOMY TO 1815

INTRODUCTION (TO CHAPTERS V AND VI)

● 121 THE family, the 'conjoint' or 'farm group' of
593 four or five families, and the larger group clustered
476 in a glen or along a shoreland, are, in ascending order, the three concentric units whose mutual relation-
632 ships we must visualise to understand the past. Enduring
621 elements of life in family and neighbourhood today, with their own special qualities and limitations, can only be understood in terms of past needs and the relationships they evoked.

121 Having seen their relationships in family, team and
613 township, we can next turn to the reciprocal relations of the people to their chief or lord, whose position dominates
621 European, indeed world, history and prehistory. Here
[171] our concern must be the meaning of 'clanship' to the chiefs, the joint farm-groups (or 'small tenantry') and, latterly, the tacksmen placed above them.

121 We may find, throughout this study, that features and
174 functions which at first sight seem peculiar to the Island
178 are really local variants, more perfectly crystallised, of forms which we know existed at earlier periods in Scotland
[184] and in much of northern and western Britain. In the Isles,

● 121 by help of oral tradition and of the living witness of con-
174 tinuing usage, we can reconstitute Gaelic life from the
178 view-points of both people and chief. Elsewhere, even in Scotland, only fragments of early life are recorded, in
175 parchments written by the lawyers of landlord and king,
814 and almost always from the privileged side. History is indebted to modern lawyers who have deciphered and
127 published the faded documents of their predecessors. But the very training as solicitor-factors which fitted them for this specialised task, in no way prepared them to view life as seen, experienced and felt by the men and women of the past, or even by the elders or youth of the townships today, with whom they have rarely laboured and whose mother tongue they rarely understand.

(A) THE LABOURS OF MAN AND WIFE, AND THE REWARD

621 We have seen that until the nineteenth century the
632 township in the main was self-contained. Its people grew,
175 reared or caught their food, and also found the raw materials
[433] for their clothing; they built their own shelter, and cut their own firing. As a result, both men and women had
174 each to develop "a wide range of simple skills", in the apt phrase of a Lewisman, Mr. Donald MacLean, M.A.
175 Beyond the co-operative effort within a family, a farm
462 group, or a body of 'fellow-townsmen'—in which each was competent to take a share according to sex and age—aptitude and family tradition initiated some local division
[463] of labour. The resident smith and the 'caird' (usually a wandering craftsman or tinker) appear in the oldest tales and in the first rent-rolls. In addition there were honorary
[759] tasks. The smith might act as the village surgeon, ready

771 a night of black mistiness . . . he waded nearly breast-
539 high" through the dangerous South Ford of Benbecula,
"conscious only of the roll and the singing of waters
and the rhythm of a poem he had taken down a few
hours before"—"The Invocation of the Graces", so
nearly lost with him! Much that Carmichael learned was
given him under a seal of confidence he never broke,
although he mourned the loss this meant. The confidence
he inspired—which even those who knew him only in their
childhood remember for life—was a source of his quiet,
unfailing power.

796 The following begins with the runes and rites of labour,
794 throughout the day, week and year, on land and sea and
at home. Turning to the day of rest and to congregational
(221) worship, one must enquire as to the presence of the clergy,
and question closely how far the people had access to the
Bible throughout the centuries: were they really cut off
from its riches, from its essence, as the Reformers and the
Evangelicals of last century asserted with such vehemence?
One can then turn to the runes and rites which opened the
phases of life, from birth to maturity, marriage and parent-
hood, leading at last to life's close.

128 But no social inheritance is without its burden. Having
181 told of the foundations of faith, something must be said
in the next chapter of the negative or superstitious side of
771 Island belief, of temptations and evils which the people
could face, and of others to which they submitted in
• (121) ignorance. From the evidence of faith and wisdom, or
error, one must attempt some evaluation of attainment by
single souls and by the community, and of the power and
fullness of life in common.

789 away scot-free! Both persons secretly concerned felt that
they had endangered their souls by successfully defeating
justice through their misuse of the invocation. Can one
(783) doubt that they were partly right in both beliefs? The
malefactor's confidence had lent success to perjury, and
perjury by help of prayer was deadly sin.

114 Now, the perverted use of prayer, as in this case, was
clearly understood to be evil-doing; but what of magic
and superstitious practices? Much has been written of
'Highland folk-lore and superstitions'.[1] The religion of
the past should be distinguished from these. In *The
Golden Bough*, Frazer drew a useful distinction between
religion and magic. Religion, he wrote, relies upon the
propitiation of higher powers—or even, in more primitive
forms than Christianity, the propitiation of the forces of
nature—while magic is an attempt at direct control of
• 121 natural forces. Superstition may be defined here as a
body of beliefs and practices in which hopes and fears
attach themselves to things seen or done, by a multitude of
false analogies and by irrational links of effects to supposed
causes. Such superstitions are marginal to the main body
of belief, worship and conduct which forms religion.

At the same time, no hard-and-fast line can be drawn
between folk-lore and religion, where religion is handed
on as living word and ritual almost without the aid of
121 writing. This is particularly true where the religion of
771 which we think, that of the Gael, is founded upon self-
supporting peasant life, in line with that of the humble,
working founder of Christianity—historically native to an
outlying district of his own country—and not with the

(113) [1] D. J. Macleod, D.Litt.: (a) *Highland Folklore* (32 pp.), Inverness; (b) Introduction to Martin's *Western Isles* (edn. Stirling, 1934). N. Morrison, Hon. D.Sc., *Superstitions of Lewis*, Stornoway, c. 1930.

• 121 theology and scholarship of a capital city, even of a city
(771) so small as Jerusalem! It is sometimes forgotten that the
Old Testament, upon which so much of theology is built,
contains folk-lore and magic. Not until this is fully under-
stood in the sense in which early Oriental 'folk' be-
lieved it, can it be interpreted, whether as imaginative
symbolism or common sense.[1] Much in the orthodox
belief of medieval or post-Reformation times was mistaken;
yet it formed part of the religion, not the 'superstition'
of the stage and period. Theology and philosophy are in
constant transformation. Sheltered scholars, priests and
rulers of cities may be ill-fitted to interpret the inspiration
of a religion which grew from life in field, pasture and at
sea, whether in its native land of Galilee and the East or
among the Gael. One must live with a people and be one
of them, at least for a time, to interpret their inner life.
Lastly, no generalisation is true for all members of a com-
munity: individuals differ. The same prayer, the same
rite, may be used in so different a way by each of two
neighbours that its use by one is religious but by the other
superstitious.

114 We have seen that the essence of the lore from which
we have quoted is not magical, but religious, in use as in
796 inspiration. Strangers who had lost the sense of the beauty
in the skies mistook a Gael's adoration of God at sunrise for
prayer to the sun; when a man unbonneted or a woman
knelt in the open, face turned to the rising moon lightening
the dark, they confused prayer with worship of the moon
itself. Now, in paganism, a belief in nature-spirits is
strong: but propitiation is made not to objects such as
the sun or moon, but to spirits believed to influence or

(113) [1] W. Robertson Smith, *The Religion of the Semites* (3rd ed., ed. S. A. Cooke, 1927). J. G. Frazer, *Folk-lore in the Old Testament* (3 vols.), 1919.

114 dwell in them—to a sun or moon spirit. If the people once
believed in a 'moon-spirit', nothing is left to show it.
796 Either the moon is addressed as if she could hear her
praise, or—more commonly—"The King of the Ele-
ments" or "of life" is thanked for sending her light.
The Archangel Michael is associated with the sun's rays;
but symbolically in relation to heart and mind, rather than
as literal belief. The response to sunrise and sunset was
real; and it is not lost among the people, as a watcher
may see.[1]

178 It remains true that pre-Christian rites were re-enacted,
771 sometimes in fear and desperation when things had gone
wrong, and sometimes in mere play. A Lewisman in
788 Carmichael's hearing spoke of "going between the two
great fires of Beul" (or Baal), his phrase expressing no
more than a faded memory. But in Reay, in hard times
bordering on famine, a fishing skipper was seen by his
small son, supposed to be asleep, to assemble his crew and
after putting out the fire on the hearth, kindle the *nei*
fire by rubbing two pieces of wood vigorously together
Each man then carried a kindling back to his own home
• 121 Was this a religious ritual of human energy, heat and ligh
symbolic of forces held to be under Divine control but
be used as they used wind and tide by strenuous effo
at the oars? Or was it magic, pure and simple? Whe
men are shaken by failures and the fear of famine, pray
in word and ritual may restore hope for better things—f
safety in storm and for fish in abundance as in a miraculo
draught—and confidence in their powers for their wo
But the same can be true of magic. And neither prayer n

(113) [1] For contemporary record, descriptions of sunsets have appeared in *Stornoway Gazette* from the pen of a crofter in retirement, N. Morrison.
[2] *Carmina*, vol. ii, Notes, *Neid Fire*.

Shawbost

Cultivation for subsistence is minimal, and in part stems from government-defined privileges and duties regarding maintenance of a croft. The Harris Tweed industry, which is restricted to the Outer Hebrides and thus is protected from competition, has provided work for a large number of islanders. Many of the younger members of croft families live in cities on the mainland, and send part of their wages home; they return regularly to the island, and many plan to retire there. Thus the township supplies urban workers who remain very much attached to the rural townships, which are composed of aged family members and a rural proletariat. The standard of living is high, and many crofters have accumulated savings, although much of this surplus is used by the men for alcoholic drinks.

In Britain, rural communities have been interpreted as lying somewhere along a rural-urban continuum (cf. Southall 1959, Frankenberg 1966). In 1959, Southall presented "an operational theory of role" by which he suggested that heterogeneous societies may be analyzed and compared. He developed the concept "density of role texture" to describe societies which lie along a continuum from rural to urban. Frankenberg (1966) uses Southall's concept along with other concepts to present a more complete model of an urban-rural continuum. The "models" of both Southall and Frankenberg are essentially lists

1: Parman E-4.5 (1970-1971) 1972 ES10 Highland Scots ES10
Shawbost

of the characteristics of roles in relatively urban or rural settings; for example, urban settings are characterized by a proliferation of narrowly defined, specialized roles. These models are unable to deal with exceptions to the continua, such as unspecialized towns based economically on agriculture, and mechanized agricultural areas. Exceptions may also be found in urban villages, that is, neighborhoods within cities characterized by low geographical mobility, or in ethnic or religious enclaves within urban-industrial settings such as the Hutterite communities in America or the conservative Red Xhosa in Rhodesian cities (Mayer 1961).

Southall (1959) maintains that social theory tends to be either too general or too specific, and that the concept of role offers a "theory of the middle range (Merton 1957)" by which communities or societies of differing complexity may be compared. Specifically, he uses the concept of role to develop a rural-urban continuum. I suggest that Cohen's concept of social boundary system offers a more fruitful and integrated approach to the study of complex societies than does the concept of role *per se*. Cohen makes use of role theory to analyze the boundedness of networks of social relations, but his unit of analysis is the social boundary system rather than the role. By using the concept of social boundary system, it is possible

1: Parman E-4.5 (1970-1971) 1972 ES10 Highland Scots ES10
Shawbost

to focus on inter- rather than intra-group relationsh
The relationship of a community to the larger societ
of which it is a part may be investigated not by try
to place it on an urban-rural continuum, but by
investigating its state of boundedness. Strong bound
may result in resistance to innovation, and insularit
even if the community or other network is in the hea
of an urban-industrial environment.

Barth (1969) has attempted to understand mainte
of cultural distinctiveness, or boundedness of a soc
cultural system, despite the flow of ideas and perso
between systems. This thesis has similar intentions
attempts to illustrate how a sociocultural environme
may produce an apparently anomalous, strongly bounde
sociocultural system.

4 COMMUNICATIONS

FROM the earliest times, the provision of communications in one form or another has been a matter full of incident and high colour. Gaelic folk-song contains many references to the hazards of crossing the impatient waters of the Minch. One such, a waulking song still known today, commemorates the death of Iain Garbh Mac Gille Chaluim, of Raasay in Skye, who was drowned in April 1617 on his way home from visiting the Earl of Seaforth in Lewis; it is said that he was drowned through the workings of his own 'muime', or foster-mother, who employed several famous witches to raise the tempest in which his ship foundered.

For well over a century the subject of adequate communications has aroused continuous argument. The strength of any island community lies in its ability to live within itself, while accepting the periodic injection of certain external items necessary for living or for work. A Londoner once expressed amazement at the isolation of Scarp, in West Harris, commenting that in Scarp they would not know what was happening in London. The indisputable rejoinder was 'Nor do they know in London what we would be doing in Scarp.' However, to a large island community, with a certain degree of economic significance, communications are the basic lifeline.

SEA ROUTES

When in the early 1800s formal sea communications were being established between the island and ports on the west coast of Scotland, down as far as the Clyde, most of the islanders were of course little affected. Except for the professional classes (merchants, ministers and the like), they had little use for the sea links provided for them. Their economy was not yet a cash economy, and travel was thus a luxury they could not afford. As the nature of local life began to change with the infiltration of some of the

PREFACE

IT was after the end of the First World War and the home-coming of the men—all too few in number after heavy losses—that I first came to know Lewis-and-Harris. Later, in the years between the two World Wars and during the Second World War, I returned to study the people's heritage and survey the Island problems and, if it might be, find solutions. Work on a West Highland farm had already made me aware of the hardships and potentialities of land and sea; of the meaning of life in field and home for farm-team and family; of the reality of the Gaelic heritage—communal, bardic and religious. Wider surveys made me aware of common elements throughout Scotland and the North and West of the British Isles, despite the historic contrasts from the Hebrides to the Lowlands, and beyond. In the Hebrides are found an elemental simplicity of environment; an early crystallisation of culture and religion, with continuity; a recent and contemporary coming of revolutionary change. These form an interpretative chain of evidence—geographical, traditional and historical—unique in the British Isles. Hence throughout this book, from the basic maps and explanatory text to the later chapters, an interpretation of the Island and its community is linked to that of the Highlands, Scotland and the British Isles as a whole.

As many a Scot of crofting stock has found, when he shares in the work of a glen by day—on the low ground and the hill, alone or with others of a team—and joins in the fireside talk and Gaelic song when night has fallen, he

121 discovers the strength of community life. And by his
181 renewal of 'racial' experience he may rediscover sides of
his own nature untouched by an urban task or a rural
128 holiday. Hence a book such as this inevitably, and I think
rightly, contains much that has been felt in a personal way.
Yet to offset personal limitations, there is needed objective
survey, geographical and social, applied with an open mind
and submitted to searching criticism. These two sides,
personal and impersonal, I have tried to combine.

114 The initiation of this work owes much to others, in
ways of which they were never to know: to the chieftain,
farmer and scholar, James Archibald Campbell of Barbreck,
to my brother Alasdair, to my father, Patrick Geddes, who
suggested in 1919 to the first Lord Leverhulme that
Marcel Hardy, scientist and farmer, should survey the land
in Lewis-and-Harris; to Lord Leverhulme, and to Dr.
Hardy himself, whom I then assisted. To Mr. T. B.
Macaulay, LL.D., was due the suggestion and the plea,
made ten years later, that I should bring up to date Dr.
Hardy's MS. report.

121 It was because of Dr. Macaulay's faith in the Island's
future and the aid he generously gave to experiments in the
reclamation of peat, and also because of the Islanders' own
response to his lead, that I accepted this voluntary task.
Acceptance, as it proved, was rash. Except for certain
valuable findings included under Dr. Hardy's name, a new
101 work had to be written. These circumstances led to the
making of the book, stretched over thirty-five years. Certain
198 early hopes recorded here have been frustrated. On the
other hand, developments have taken place which few
could have foreseen but for their faith in the future of the
Island and its people. I trust that in this book the advan-
tages of slow growth outweigh the drawbacks, for time

121 allows one to revise judgments in a way not possible in a
178 short-term study. And only by prolonged knowledge of
the Island can one hope to appreciate the changes which
have been taking place, and the trends of today.

123 My chief debts are the hardest of all to acknowledge,
namely the patient guidance, information and hospitality
so freely given, as I tramped from end to end of the Island
or stayed in chosen townships. Indeed, my debt extends
beyond the Island, from glens in the mainland to the
southern Hebrides. The debt for specific information
received is the harder to acknowledge since, again and
again, I was invited to utilise information on condition of
silence as to its source. Many statements given here
would gain in authority if their source, whether private or
semi-official, could be given; but this has frequently been
impossible without violation of confidence. Hence my
thanks go out to many anonymous crofters, schoolmasters
and residents and also to officials, particularly of the
Boards or Departments of Agriculture, Fisheries, Labour
000 and the Post Office. There are also those whom I cannot
leave unnamed, particularly the late Mr. W. J. Gibson,
C.B.E., Mr. Angus MacLeod, B.Sc. (Agric.), Dr. R. M. Craig,
Miss Bruce of the Highland Home Industries, Mr. J. S.
Grant of the *Stornoway Gazette*, Mr. Malcolm MacLeod,
D.Litt., Mr. A. M. Macmillan, C.I.E., Mr. John Forbes and
Professor A. C. O'Dell. The late Professor Alan G. Ogilvie,
Professor H. J. Fleure, LL.D., F.R.S., Professor W. Croft
Dickinson, M.C., and the late Mr. Adam Collier also
advised me most helpfully.

For the loan of blocks I am indebted to Professor A.
Stevens and Dr. R. M. Craig, and to the Editors of the
Scottish Geographical Magazine and of the *Transactions of
the Royal Society of Edinburgh*.

133 line; and there can be no doubt of the contrast found at
131 the extremes. How strikingly different from any view
over the English Plain is this, from the air or a mountain-
top! It overlooks the ice-scraped rock of the fells; the
drift-heaped, ill-drained hollows studded with gleaming
lochs and deeply overgrown with peat; and the indented,
insular coastline with its widely spaced crofting townships
looking seaward, where a few fishers' sails may dot the
161 vast expanse of ocean. In 1951 the population of Lewis-
162 and-Harris numbered only 28,000 persons, and that of the
entire Outer Hebrides some 36,000; but the small num-
182 bers need not lessen the geographical significance of the
community.

18 Men have long recognised the homogeneity of the
English 'Plain', with its recurring vale and wold, compact
within a rounded coastline. In spite of the local variety
of landscape, history or dialect, which enriched its heritage
and compose its grandeur and charm, men have sensed the
unity inherent in this land of a single tongue, centred upon
a single capital. By contrast, the diversities in landscape,
life and tongues of the lands far-flung to north and west
have obscured the elements of a profound, underlying
unity in geographic origins and in historic and social
121 evolution. To understand the civilisation of the British
Isles, it is vital first to perceive the complementary qualities
found in the two great regions, and face their corresponding
198 weaknesses or limitations. Second, within the less under-
stood of the two regions, 'the North and West', it is vital
to study the almost bewildering variety in regional types
of life—distinguishing, for instance, the uprooted popu-
lations all too typical of the rural Lowlands of Scotland
or Northumberland from the still deep-rooted communi-
ties of the Highlands and Isles.

121 From prehistory to the present day, these geographic
178 zones have played their parts as factors in evolution,
although the border-lines have changed at different historic
174 crises, and have been modified by economic and social
182 phase. At times the Hebrides have been more closely
linked to Ulster or to Norway than to Central Scotland.
184 In viewing these zones, we shall not find simultaneity in
historic events, but comparability in stage and transition,
even at differing periods. From the evolutionary point of
view, the revealing character of Island life lies not only in
static survivals, in what Sir Arthur Mitchell found in the
Isles and vividly described as "the Past in the Present".
Island life is characterised still more by the dynamic
strength of its continuity—notably of early or primitive
Christianity—and also by the late occurrence of changes
when, at last, they came.

18 The social consequences of these regional differences
in evolution are profound. In the 'Plain', to the south-
62 east of the Severn-Tees line, large village communities
174 with 'common fields' prevailed, forming the later manor
473 villages. To the north and west, the more varied, hillier
192 lands encouraged the continuance of hamlets. These
hamlets housed close-knit groups of families, often of no
more than four or five to a dozen relations or 'friends'—
—in Scots even today (much as in Gaelic) the word
'friend' frequently implies kinship. Each small group
462 formed a team. Together the men ploughed their mingled
476 rigs (or ridges) and herded their stock in common, and
on the coast they rowed their boat as its crew. The
241 women, too, did much together, as when they spun their
286 yarn, and fulled or 'waulked' the cloth that one of them
had woven, helping by turn in childbirth and child-care.
473 Usually several of these teams were linked in a larger

184 Comparisons at the present day are most illuminating.
[991] In the Hebrides one may pass from Calvinist Lewis-and-Harris to Catholic Barra, through South Uist, where Presbyterian and Roman Catholic dwell, side by side, in mutual respect. Although their home life, economy and language are the same, the influence of a comparatively
• [121] recent divergence in religion is marked. Such Island evidence, present and past, forces one to re-examine conclusions upon life in the Lowlands accepted until recently, and to seek for the truth upon earlier forms of life in common and for their meaning today throughout 'the North and West'.

175 Ancient elements of unity, and later ways in which
473 these were broken, adapted or remade, region by region,
427 are being unravelled. The Old Estate Plans, made at the outset of the agricultural revolution, show these immedi-
621 ately before the re-planning of fields and farms (*circa* 1750–90). These plans also reveal the existence of still
178 earlier types, not otherwise recognisable even on the spot.
[184] With their rentals (when available) they reveal the ways in which old joint farms were placed under a single tenant, as in Lothian, or were split up among several tenants, as in Ayrshire.[1] From such geographical data, both the economic and the deeper social aspects of rural life emerge with new clarity. Such data may be linked to Planning Surveys of land and rural life for tomorrow.

621 Now, although so fundamentally equalitarian within
427 themselves, these hamlet communities of the Gael were subjected to the overlordship of a chief or laird, either directly or through an intermediate gentleman-tenant, a
[194] 'tacksman'. History, with archaeology read in history's
[192]

[113]

621 light, suggests that such lordship goes back to early con-
427 quests of self-supporting agricultural and pastoral com-
194 munities by well-armed raiders of many races, including
[172] the Celtic-speaking swordsmen of the Iron Age. The last and most notable of these conquering raiders were the Norsemen. Their influence was profound, whether, sailing direct from the Scandinavian forest settlements and fjords, they raided and settled as heathen Viking crews, or, at a later stage, they invaded England from Normandy—that fertile province which they had made theirs in fact and name—under the panoply of civilisation and with Papal benediction. A generation after the Conquest they commenced the penetration of Scotland.

183 The paradox of loyalty to one's fellows with loyalty
181 to a lord, of stoutly equalitarian thinking bound up with fervid admiration for an aristocracy, is nowhere more
[614] marked than among the Gael. They sought to reconcile these conflicting loyalties by claiming common ancestry for chief and people, as the children (*clann*) of a hero of history or myth. The years 1945–47, which marked a centenary of the last of the desperate Jacobite Risings, stood at the close of the latest of many wars in which fame has been won for the symbol of clanship—the tartan, long proscribed (by the Act of 1747) 'to every man and boy in the Highlands'. At such a time, the Gaels' loyalty to the death cannot be forgotten although old kings, old
• [121] chiefs have gone. But its paradox must not only be re-
[182] membered but understood, from its roots in communal life and environment through history. Not until this is
[184] done can important phases of our own time be understood, such as the failure of Lord Leverhulme's seven years' endeavour in Lewis; nor can the present opportunity of Highland renewal be grasped by the help of

183
181 democratic reorganisation, with loyalty to one's fellows and to a leader.

Here again, Lewis-and-Harris may have something to
178 teach, as one of the last communities in Britain in which
185 much of ancient common right over land and sea has been upheld. Trust ownership of Stornoway estate has strength-
[174] ened the possibilities of rural planning there, while the fisheries are a public resource which are partially protected
[423] for local fishermen inshore and farther out are closed to none. The useful Lewis Association has published models of local survey for social and economic planning. At a time when democracy is struggling to see its way towards economic and social freedom, such communal initiatives have more than local significance.

• 121 This sketch of comparisons and questions in rural life
131 raised by Hebridean evidence, through a wide and varied region of the British Isles, must serve to indicate the geo-
182 graphic setting of the Island and relate the historic and contemporary problems of its own community to wider fields. This book is not directly concerned with the urban and industrial problems of the firth-sides and 'included plains' within the varied land of 'the North and West' of Britain, deeply though they affect the hard-hit fishermen of the Isles and the Island migrants—seamen or labourers, tradesmen or factory workers, nurses, teachers or clergy.
121 Even for the migrants' sake, it is vital to maintain the
185 economic balance, and restore the cultural and spiritual life within each industrial region, in order to maintain that of Britain as a whole. It was not enough to schedule 'the murdered towns' of Tyneside, Wales, Lancashire or Clydeside as 'Distressed', 'Special or Development Areas'. The balance of Britain as a whole must be restored.

• 121 And region by region, a fairer balance must be struck
185 between country and town. In Lewis, the part of Storno-way town, with its population nearing 5000 (in 1951), is
[162] important. Its port, its fisheries, its spinning mills for the
[184] crofters' hand-loom weaving, its merchants' shops, and its local, administrative and professional services, are essential to the Island. Its economic and social evolution, too, are
[162] interesting. Stornoway's plans for the future are active and ambitious, and these, it is realised, depend upon the prosperity of the 19,000 crofting people of Lewis proper.

121 But the subject of this book is primarily rural. It is to
128 see with fresh eyes what, from our Harris mountain-top, we viewed as a unit at the core of 'the North and West'. After the island has been described in terms of its physical and human geography (Part One), the endeavour (in Part Two) will be to give a completer account than may yet have been given of the nature of Gaelic community, with
[621] its temporal duties and its spiritual sanctions. The three concentric circles of community are described: the family, the farm team and boat's crew, and the larger township groups. The relations of this threefold grouping of livelihood and society to Chiefs and Church are studied, and followed out in later evolution, until today. Elsewhere I have endeavoured to show how the Island can worthily maintain itself, and thereby find a new freedom. The final chapter returns to the broader aspects of society and region touched on here.

If this intensive study of a single isle and community can throw fresh light upon certain essential characters of the less-understood region of the British Isles—that lying outside the south-eastern 'Plain'—it may help to con-
121 tribute to more than economic reorientation. The significance of the Island life—not so much for the past, which

• 121 cannot be changed, as for the future which can—lies in the intensity of its communal traditions, extinguished else-
[178] where. Much has gone—many of the fishing crews are disbanded and team-work has weakened—but much lives
[184] on, and much has been learned. The Gaels have still to make their full offering to English-speaking civilisation. To do so, they must find their own fulfilment within the framework of the Highlands of Scotland.[1]

2. *Scottish Crofts, Farms and Labour-teams: the Rural Unit Today*

184 When, in thinking of Scots countrymen, we differentiate
105 between the men of the Highlands and Isles, the Lowlands and the Borders, what stamp of occupation, society and economic class best characterises the three regional types? The differences we note between them are due not only to their place of birth and region, but to their occupational
[433] discipline and social ways. Imagine, for example, a Gael, a Lowlander and a Borderer, all three of whom follow the same calling—say, a trio of farmers, of shepherds or farm servants, or of independent, full-time small-holders. When brought together each trio would find they shared similar interests and aims in their work, and all that follows from it. In fact, they might have more in common than three Gaelic-speaking men who differed from one another in vocation, although, as Gaels, the latter group would find a bond in culture and kinship. But a fourth type of Scot, the crofter of the North-west townships with whom this book is concerned, would stand out, distinctively, from any other, whether his home were Zetland or the Hebrides. Thus not only their home or region differentiates Scots countrymen, but their calling or class; and their families

3: Geddes K-4, 5 (1919-1952) 1955 ES10 Highland Scots
Lewis and Harris

magic is always efficacious—however desperate the need, however pure the motives of those who ask. These men were said to be the most successful fishers in the place; they were also Elders of the Kirk, who saw no wrong in what they did. They did not inform the minister; but the good man was not a fisherman and did not understand either the mysterious ways of fish or the incitement of a crew!

While this *neid fire* was kindled in all earnestness, a miming song-dance I have seen in Eriskay is pure fun: 'the Carline or Witch-wife of the Mill-dust' (*Cailleach an Dudain*), who falls down dead and is brought to life again! Once, perhaps, a half-remembered symbolic 'play' of the seasonal fall and resurrection of seed, it is certainly in form and spirit a thing of happy laughter now! Tales were retold by Martin and a seventeenth-century English skipper, of offerings made to a sea-god, Shony, at Eoropie, Ness, for the sake of seaweed, followed by feasting and drinking in the chapel there.[1] The story may be garbled or, if true, may record a pre-Christian survival turned to merriment and of no more significance to the people of the time than 'the Carline of the Mill-dust'. The prayers for the seaweed necessary for agriculture and daily bread are Christian in spirit.

When the people were at the mercy of periodic famines, diseases and sudden death, there were ample grounds for fears. Hence a word must be said of a belief widespread and ancient in the Old World, 'the evil eye' (*droch shuil*). In the absence of clinical diagnosis, a malady, or a misfortune to oneself or a valued possession, might cast suspicion on someone present when it occurred; and

[1] W. C. Mackenzie, 1919, pp. 143-208. Contrast *Carmina*, vol. iv, pp. 33-35.

Lewis and Harris

gentle frankness, as there is for reticence.[1] But since Augustine, orthodox religion, Catholic and Protestant, has overstressed and misunderstood the folk-lore of 'the Fall'—originally, it seems, a legend of fertility and fulfilment! In part as a result of the teaching of the doctrine of the 'Fall', there has arisen an attitude to parenthood which falls short of rational understanding and reverence for human life.[2] If fact be the best guard against superstitious fancy, and if sensibility and tact can soften the first shock of adolescence, then the Gael knew wisdom.

Returning to the main theme, it is clear that primitive religion and folk-lore alike show misunderstandings of cause and effect, and of the action of 'mind' on 'body' and 'matter'. What are facts to faith may be symbols to science; yet if these symbols prefigure truth, they may outlast the present stage of scientific recognition. Gaelic belief and practice show a recognition of communal as well as individual spirituality; of the depth of consciousness below its upper surface, and its upwelling power; and of the visible world without, in all its beauty, as a gate

[1] Needless to say, Gaelic verse has its moments of coarse freedom like that of any tongue. Of the lively lilts (*puirt-a-beul*) sung when there is no piper or fiddler to play for dancing, most of the words are delightful, but a few are not. A rather 'drinky' dissolute fellow—a small contractor on one of the Isles whose apprenticeship in the cities had not improved his character—once quoted a coarse jingle to me, only to see little amusement at his song and some contempt for its singer. He excused himself by saying, "It's rough . . . it's rough—but it's not dirty"! His excuse sums up the cruder expressions of animal spirits found in Gaelic jingles. One may adapt it as "Sometimes coarse, but rarely or never vicious".

[2] A. Geddes, "The Origin of Sin in Genesis and a Missing Legend", *Hibbert J.* vol. 44, Nos. 1 and 3, 1945-46. Cf. *The Legends of Creation: an Anthropo-Geographical Interpretation of Genesis*, i-iii (with map); *Man*, vol. 45 (104), 1945.

The Churches have given attention to the second chapter of Genesis, at the expense of the first. Gaelic spiritual tradition seems to have been singularly unwarped by such confused mythology, and to have held firmly to the first chapter, in its noble simplicity.

175 real hopes that prosperity could be maintained. In 1914
228 war came, followed by sweeping changes in international
trade. These changes left the Island fishermen workless,
178 and with wrecked and rotting boats. In twenty years the
[439] number of Scotland's fishermen was halved, and the remainder all but ruined. For guidance, past progress and past losses should be reviewed, in order to see what measures can be taken to restore prosperity.

121 For the slow growth of a native fishing industry, two
175 factors were to blame: the poverty of environment, to-
gether with the unsettled state of the Isles, and also, it
182 seems, the jealousy of urban interests. These were repre-
228 sented, to 1603 and even after, by the Royal Burghs, and from 1707 by the British Parliament. The Royal Burghs certainly developed Scottish trade and industry through their own ports, but they feared competition, and opposed any direct contact of other ports, such as Stornoway, with foreign fishers and traders. From the days of the MacLeods
[648] this difficulty had hampered regional development. It was in spite of royal prohibition that Seaforth encouraged Dutch curers to settle, an arrangement interrupted by war with Holland in 1653 and 1665. Curers from Caithness and the East Coast were encouraged to replace the Dutchmen, and from time to time through the succeeding century efforts were made from the south to form fishing companies, and in the Island to encourage local fishers to profit from example in the catching of herring and of ling, hake and cod.[1] The people fished for food, with fishing-rods from the shore, and in frail boats in the lochs, and if they
[648] could, they also sold a surplus. Fish were not only taken direct to Glasgow, but sold at home, first to Scots and foreign and later to British boats, of which ninety visited Lochs in

[1] W. C. Mackenzie, 1919, p. 65 ff.

175 1794, for instance, their crews not only fishing but also
228 buying from local fishers. Islanders occasionally earned a pittance as pilots, for until the charting of these rocky coasts navigation was most dangerous.

175 The herring industry was in the hands of 'adventurers'
228 (who 'ventured' their capital), and the Islanders benefited
[477] little. The British export was aided by a bounty which
[439] helped to capture the Continental market; but, as Adam Smith pointed out, no bounty was given to the small, open boats suitable for the north-west lochs. Thus the operation
175 of the Salt Duty after 1707 and of the bounty system from
228 before 1745 until 1786, illustrates two of the recurrent
656 blights upon "Public Administration" in the Isles. As Day wrote, their interests have had to suffer "either deliberately, for the benefit of other parts, or other classes in the kingdom, or inadvertently from ignorance".[1] Although the bounty system was widened to include small boats after 1786, the Salt Tax remained until 1817.

To overcome difficulties, the British Fisheries Society was founded with Government support in 1786. Although Stornoway then seemed too far afield, the Society's concentration upon larger settlements foreshadowed Lord Lever-
[311] hulme's principles after 1918. At Ullapool, Tobermory and Lochbay (Skye), and at Wick, quays and stores were constructed and dwelling-houses built, with croft land and grass for a cow, to be reclaimed. Although concentration at Wick led to the sale of the three western properties about 1842, the Society had done some good work in the West. The chief difficulty of the West Coast north of the Clyde area and south of Stornoway District remained: the lack of a well-marked seasonal migration of herring.

[1] J. P. Day, *Public Administration in the Highlands and Islands of Scotland*, 1918.

175 some whose feelings and interests opposed emigration.
168 Free Church ministers foresaw that the beliefs they had
167 introduced would be shaken by travel; and their income, like that of the merchants, would have disappeared as a
[647] result of depopulation. The Congested Districts Board, however, sponsored two schemes of colonisation in 1888–89. In the first scheme thirty families, and in the second, fifty families were taken to Canada, mostly from the Island.[1] The first and smaller group repaid their loans and received their lands; but the second failed to do so, and the State was only reimbursed by sale of the land.

121 The story of the schemes suggests the lack of four
181 elements needed for success: promptitude in organisation; sympathy with strictness, and a sufficiency of funds; a year's experience of new conditions or technical guidance, rather than segregation of the inexperienced without leadership; and choice of vocation as farmer or as farm servant. Many a crofter-emigrant has succeeded as a shepherd and farm hand or as an independent farmer; but not every Islesman, particularly a cottar or landless squatter, is fit to conduct a farm. Technically, an all-round experience of part-time crofting and fishing by rule of thumb does not train a man for farming in a new environment without even a year's apprenticeship. Success is possible in schemes which overcome initial difficulties by providing training, companionship and community life, in a suitable physical environment.

121 One further principle of communal life was the spiritual,
181 which Parliament and administration failed to grasp. The most significant evidence in the Napier Commission was
771 that of A. Carmichael; and from this the Commissioners

[113] [1] J. P. Day, 1918, pp. 123-125, from Reports of Congested Districts Board, and Crofters and Colonisation Commissioners (Fifteenth Report).

121 had learned that the spiritual sanctions of the township's
181 activities were not yet dead. Legal recognition of the township's social economy would have encouraged con-
771 structive action in common. Communal responsibility, not merely private morality, would have had to be upheld. As it was, the people's acts of charity or justice modified the growing individualism of tenure and economic relationships. But with township duties to perform and a high standard of office to fulfil, the congregations could have maintained a common purpose; religion would have retained a deeper social meaning, binding neighbours as one. It is true that divisions rent the Island communities, as a result of the Evangelical reaction both from the lay patronage of the Moderates and their easy-going tolerance. Protestantism broke with the communal religion of the past and emphasised individual salvation, faith and doctrine, at the cost of schism. Hence, it appears less able to aid the renewal of the township than Catholicism, with its greater emphasis upon corporate unity, mutual aid and Christian works in common. Yet, if men of the township had been chosen to bear communal responsibility, then, 'living the life', would they not have re-learned 'the doctrine'? Ministers did not share in common responsibility, it is true, nor do they now. The Established Clergy dwelt apart upon their glebes, and the Evangelicals are housed in the village, but without a croft or a share of the scatt and a common grazing. Yet in youth as the sons of crofters, and after ordination also, they might have learned from chosen Elders.

000 Altogether, for reasons not only temporal but spiritual, the township with its elected officers should have won recognition. Given the responsibility which those who knew it believed it could still fulfil, the crofters' relations

175 the work done—or rather not done—by the local labourers;
653 for deep peat has misled road engineers elsewhere.
But impartial observers have left no doubt that the work
461 was shirked—partly from the labourers' lack of will,
181 in other words from laziness, and partly from the not unnatural desire that further grants might continue, offering easy money. Inspection revealed deliberate and combined concealment of bad work, road metal being thrown on to give a surface which had no foundation. The Carloway road, which was to help the Loch Roag fishermen by rapid transport of fresh catches, was never completed. The bad work of many contributed to the undoing of all.

175 . How are these two apparently contradictory responses
657 to help to be explained? The answer lies in the completely
653 different methods of expending the grants. A loan to fishermen for a boat was put into their own responsible
121 hands. The hope of profit in which each could share stimulated their enterprise; and where both the private honour of each member and the corporate honour of each crew was at stake, mutual obligation and team-spirit spurred them to work. But road-making—a work many had done for contractors elsewhere as navvies under de-
181 grading conditions—was different. A Gael responds when his imagination is fired, whether for selfish or unselfish ends; but he can also enjoy leisure as to the manner born! Not only was personal skill or effort in road-making of no advantage to an individual; there was little to call out either personal prowess or team-spirit in the work. Moreover, little effort appears to have been made by the administration to arouse ardour. The ultimate advantage of a good road to the people on the west of the Island, as a whole, was clear. Yet since bad work and delay led (at first) to further

195 language." Many Islanders would agree with the state-
178 ment that Gaelic was a barrier to economic progress.
197 It was not only Lowland schoolmasters, ignorant of Gaelic
182 but an educated, sensible class of men in their day, who
used the strap on the palms of the little children "for
[510] their good" because they could not understand English.
An active Lewis country schoolmaster, who had considerable
175 rural knowledge and experience, said to me: "I know what
197 I have suffered through life from being brought up on
871 Gaelic. If I had my way, I would *punish* [with the strap]
every child I heard speaking Gaelic in the playground!"
Had the Island School Boards wished Gaelic to be con-
sistently taught with English, they could have prevailed.

114 One may not only disagree strongly with the means—
197 the strap—but hold that enlightened bilingual teaching is
871 both worth while culturally and also of assistance to
intelligence without interfering with use in English of the
three Rs, and of secondary and higher education. Yet in
153 Lewis recent non-verbal tests in English and Gaelic show
a mean intelligence quotient depressed by about 15 points.[1]
153 The conclusion seems to be that under the present system
197 the Gaelic school child is still at a disadvantage compared
182 to other school children. But even more important to the
child's development would seem to be the expression of
• 121 his response to his rural environment in his own tongue.
For this the school tests and the educational code do not
fully provide; nor do the tests of life when the adolescent
Islander suddenly finds himself at work in a Glasgow
175 factory or abroad in city streets. What concerns us here
197 is the economic drawback of a lack of ready English among

182 [1] Christina A. Smith, M.A., B.Ed., *Mental Testing of Hebridean Children*
[113] *in Gaelic and English*. (Scot. Council on Research in Education, vol. xxvii
(London, 1948); J. L. Campbell, *Gaelic in Scotland* (and ed.) (Edinburgh,
1948).

178 exists at Tarbert and another was erected in 'the Bays'
286 district by Leverhulme. Leverhulme also appears to
have introduced 'Automatic' hand-looms into Lewis.
[423] Today as in the past, the weavers possess a little croft or
[422] a feu, a cow, and a few sheep on the outrun, and perhaps
a small boat.

• 121 Commercial fishing and weaving cannot, however, be
286 satisfactorily combined, for seasonal alternation of occupa-
228 tion entails waste of gear and plant, and interferes with
182 efficiency. Thus in the North Lochs fishing 'creek'
178 (Leurbost neighbourhood, immediately south of Storno-
way), weaving became important, but none of the seven
large herring fishing boats (still registered in 1930) had
been fitted with motors after 1918; they were idle and
[501] rotting, and by 1938 only one was still registered. In South
Lochs, however, motor-boats were purchased, but there
is little weaving. An obvious reason for the difference is
the accessibility of the North Lochs area by road to
[493] Stornoway. Light passenger cars bring yarn to the village,
besides groceries, etc., and take away rolls of tweed. South
Lochs, on the other hand, considerably further from
Stornoway by road, is still within reach for marketing fish.
In North Lochs, merchant seamen at home and young men
on their return from three months' work on East Coast
fishing boats, turned increasingly to the 'Automatic' looms,
manipulation being easily learnt; but such intermittent
work alone gives little hope of progress. There is no more
fascinating problem than the future of improved weaving.

2. *Unemployment and the Island Budget*

174 In the past, the storms of the Atlantic washed up on
731 the Island shores the wreckage of world commerce; and
434

CHAPTER XI

CONCLUSION

ISLAND, REGION AND NATION. REGIONAL SURVEY FOR COMMUNAL SERVICE IN 'THE NORTH AND WEST'

• 121 THE aim of this study has been the survey of a
region for the service of its society. Survey is
fundamental. As treatment should follow diag-
nosis, so should decision for action be based on balanced
knowledge. Until now this has too seldom been the case.
[311] In Scotland particularly our land and resources are as yet
imperfectly surveyed; our activities are still too hap-
[181] hazard and chaotic. There is work to be done and there
are hands to do it, but they have been kept unemployed;
the workless slackened in body and mind, and their spirits
failed; and our communities are still without clear aims
[185] in common. The first five years of peace have seen an
increased awakening to integrated planning. Planning
must be preceded by survey and be linked to international
order; it must be aimed towards better living and finer
[171] purpose. This study is part of a world-wide movement
of survey and planning directed, not first to private gain
but to common ends. In Western Europe until the war,
in the United States and (in a different way) in the war-
ravaged Soviet Union, men and women of good-will have
striven to prepare for a 'New Deal', region by region.

• 121 The importance of the 'regional' movement is inter-
185 regional and indeed international. In the case of the
438 Island, international order is required for its fisheries to
recover, and for its weaving to find purchasers abroad as
well as at home. This in turn could allow small-holding
to find an Island market in its little burgh, Stornoway.
Without this triple basis of fishing, weaving and crofting
for its economy, Island society will break up and its culture
[182] vanish, not evolve. It is no less true that only by the best
utilisation of each regional environment, economy and
society as we find them, will profiteers be held in check
at home, and powerful peoples cease to exploit the sweat
of others.

121 A pioneer American Report acknowledges the debt of
171 regional survey for the New Deal not only to France and
Germany, but to a group of practical idealists, of geo-
[185] graphers, biologists and sociologists in Britain.[1] If nation-
[433] ally we can be proud of Scots and British initiative in
planning, we must own, until recently, to humiliating
[184] slowness in its execution, and in the mobilisation of regional
resources for social ends. The chief end of our planning
must be the re-making of society. In Britain it is not
always realised that in the great developments of the New
Deal the execution of concrete schemes which include civil
engineering, industrial expansion and agricultural con-
servation, is accompanied by real cultural achievements,
both urban and rural. Not only are geographers and
economists, technicians, industrialists, and officials called
to survey and plan the Tennessee Valley, but sociologists
and educationists are required to complete the work. Not

(Britain).

• 121 only the place but the people are to be understood, re-
171 spected and helped.

The planning movement is gathering impetus in Britain,
121 as it spreads outwards from bombed towns to countrysides,
171 embracing regions as a whole. It is certainly destruction
in war that has stabbed the nation's spirit 'broad awake',
185 awake to features of economic and moral disintegration
184 that preceded actual warfare. The realisation that defeat
of the common enemy called for common effort roused the
nation to face its enemies of want and confusion at home.
Yet the seeds of the planning movement were sown in
peace, and only in peace can they grow to fruition. Plan-
ning, prepared for by the survey of each region as a whole,
must lead towards the freeing of its people not only from
physical want but from spiritual frustration. Based on the
provision of work and a livelihood for individuals, planning
should envisage the common weal and attempt to realise
the deepest cravings of each community and serve their
highest ideals. In a word, there must be a regional vision
of the unity of life.

128 This book began by viewing the 'Outer' Isles as a
18 heart of 'the North and West' of the British Isles,
the innermost of a series of regions extending from the
North-west Isles to the landward margin of the English
'Plain'. Differences in landscape and community, in
history and modern life, make each of these regions
unique in itself; yet—it was suggested—all possess certain
features of landscape and evolution in common, which
marked them off from the 'Plain' of the South-east.
Some four physical and human frontier-lines or border-
zones divide these regions. South-eastward from the
Minch four were selected: the Highland Line, the Scot-
tish Border, the edge of the older rocks of Britain and,

128 enclosing all, the zone from Severn to Tees. Having por-
18 trayed the environment and life of the Island—' innermost ' of the regional series, the next step was to extend this survey beyond the Minch to the Highlands and Isles as a whole, and then to compare these with the regions extending south-eastward—' outwards '—from the Isles to the margin of the ' Plain ', through the regional series we group as ' the North-and-West '.

121 Two main tasks lie before us in making comprehensive community surveys, once the geographical basis is established. The first task, historical in method, is the redis-
[133] covery of cultural foundations. These might be compared (as we said at the outset) to the Archaean gneiss laid bare only in the North-west, but still the foundation, albeit a hidden one, of the ice-sculptured rocks of Highland Britain, from the pre-Cambrian to the coal at the margin of the overlying, differently sculptured rocks of the ' Plain '. Understanding of the past can help us to understand not only the evidence of the present, but latent, underlying powers. Regional traditions, dormant for one, perhaps for many generations, may germinate afresh if we can understand the conditions in which they once grew and also those needed to awaken them to new life in finer forms.

The other task of social survey must be to recognise the communal efforts of the present, and with eyes undimmed by prejudices of class or culture, grasp the relation of personal efficiency and self-realisation to life in teams or groups. The inherent cultural interests of the people of each region in work and leisure must be evaluated. Underlying actual achievements, latent powers may be discovered which must be freed for communal attainment. Better work under better conditions should bring about the flowering of personality in harmonious communities.

121 In every community, social and spiritual relations are inherent, and these, at one time inseparable in Island life, are once more winning recognition.

If this intensive study of a single isle has sustained the unity inherent in a region's environment, work and people, its first intention will have been accomplished. A second aim will have been achieved if it has faithfully re-interpreted the way in which small communities of ' Highland and Island Britain ', in spite of their stark poverty, once realised their vision of fellowship, in labour, in leisure and in spiritual life. This aim led in turn to tracing the transitions through which the community reached their present stage of society.

In another book there have been presented means by which an integrated policy could be implemented for fishing, for weaving and other country industries, and for crofting. If that study of " The Resources and Prospects of the Isle " could contribute to a fresh economy for Island life, the third purpose of this survey would have been attained. The Islesmen themselves must show how economic development, planned with common purpose, may renew the communal, cultural and spiritual achievement of the Hebrides.

PREFACE

114 This report is the result of a remarkable co-operative enterprise. In August, 1959,
121 a party of 19 members of the Geographical Field Group and Scottish Field Studies Association undertook a survey of crofting in Uig, one of the four parishes of the Isle of Lewis. In less than three weeks more than 700 crofts and other households were visited or recorded in accordance with a scheme devised by my colleague, Dr. Caird, and myself. This scheme has been used by us in other parts of the Hebrides and, therefore, the record of Uig is an integral part of our Outer Hebridean crofting survey, undertaken between
[122] 1956 and 1961. We are extremely grateful to the nineteen voluntary field-workers who, it is worth recording, travelled from England and stayed in Uig entirely at their own expense in order to help us: they could have spent their holiday more cheaply in Switzerland - an enlightening comment on the fundamental economic disadvantage of the Hebrides.

125 The object of the work was to make an impartial record of the state of crofting as a
[121] way of life and as a means of livelihood. The boundaries and land-use of every croft were recorded on 1/2500 plans, enquiries were made as to acreages of crops and grass and numbers of livestock, and the population of each household was recorded, taking account of sex, age and occupation (part or full-time) of each member including those who, perforce, must seek work elsewhere even though their only home is in Uig. The Croft Record form is reproduced opposite.

122 The successful completion of the survey was not only due to the co-operation of the Geographical Field Group and Scottish Field Studies Association. Adequate preparation would not have been possible without the advice and help of officials of the Department of Agriculture, County Council, Scottish Land Court, Crofters Commission, David Macbrayne Ltd, the estate factors and many other bodies. Miss C. B. Smith, Carnegie Research Assistant, undertook much of the tedious preparatory clerical work. In Uig
123 itself we were encouraged and assisted wherever we went. We owe exceptional debts of gratitude to the Ministers, school-masters and township clerks, who welcomed us and made our purpose known throughout the parish, also to the families who took us into

233 no road and access by foot is difficult. To reach the grazings the crofters travel by boat from Mealasta several times a year and stay in one of the two houses at Aird Bheag which, although vacant, is still in repair. These houses were formerly occupied by estate employees who had crofter status.

51 From the above account, it is evident that in this district as in others, a single croft is not sufficient to support a crofter and his family. On an average, each resident crofter has acquired the equivalent of two crofts, and in addition each crofter supplements the meagre income obtained from his croft by some other occupation, e.g. weaving, labouring, or driving.

CHAPTER FIVE

THE UIG BAY DISTRICT

(Carnish, Ardroil, Timsgarry and Crowlista)

by

Elizabeth Blowers.

134/ Uig bay, in which low tide reveals several hundred acres of pure white sand, is surrounded by crofting townships. There are no extensive machair plains but the shell-sand forms a fringe of easily cultivated, lime-rich soils on all sides except Crowlista, and, blown inland by the Atlantic winds, it modifies and improves the texture and acidity of the peaty soil as much as 2,000 yards from the shore. It is not to be wondered at then, that 361 [175] this bay at one time formed one of the most important centres of population in Lewis. Signs of ancient cultivation, and the ruins of old clachans, are widespread, but most of the present settlements are less than forty years old: almost the whole area was cleared to make farms in the early nineteenth century. Only in Crowlista, with its thin, rocky, [121] arable land and almost complete absence of machair, were the small tenants left undisturbed. Consequently the district provides an opportunity to compare "old" and "new" townships, both as to lay-out and operation.

133 Carnish, in the south-west, is dominated by a huge gravel ridge - probably an esker, - over a mile long and sloping steeply to the estuary of Amhuinn Chaslabhat with the rocky 361 headland of Machair Carnish to the north. The arable land and houses of Ardroil are situated to the landward side of the hummocky machair land between the esturies of Amhuinn Chaslabhat and the Forsa river which drains Loche Suainaval and Stacsavat. To the north of the bay the old settlement of Crowlista is situated on the rocky headland to the west of the Rethall embayment; there is a good deal of level land in the centre of the township but the slope to the estuary in the north is steep and rocky outcrops occur on the headland. Timsgarry, to the east of Rethall, stretches inland between the headlands of Tolamish and Borranish along the valley of the Erista river.

134 There is a mantle of gravelly drift over this area; the Carnish esker has been mentioned and exposures of up to 120' were also seen in gravel pits in Ardroil and Timsgarry. Along the coast blown shell sand rests on this drift and reaches inland for up to half a mile.

161 In the northern townships, stretching from Garynahine to Loch Carloway, quite the 162 reverse is seen. Here there are actually more people now than in 1841 (1,261, c.f. 1,204), although there has been a marked decline since 1891 when 2,106 were enumerated. Thus this area, which had less than one third of Uig's population in 1841, now has more than half. The main change occurred before 1891 and was associated with the prosperity of fishing, both locally and on the east mainland coast, but, in addition, this area did not lose population as rapidly as did Bernera and the southern townships in the 'twenties and 'thirties, nor since 1951, and this can undoubtedly be ascribed to the early establishment, especially in the Carloway district, of Harris Tweed weaving.

TABLE 49

Loss of Population by Districts, 1931 - 1959

	Annual rates: 1931 - 1951	1951 - 1959	Net loss: 1931 - 1959*
Carloway District	0.5%	1.6%	182

Mangersta/Brenish	1.8%	2.1%	97

* Immigrant R.A.F. and Ministry of Civil Aviation staff and families are excluded.

Migration

121 One of the objects of our enquiries was to discover something of the processes of population change in recent years. To this end we tried to record some details of migrants, 16 from and to the parish since 1939 (see croft record questionnaire, frontispiece to Part I). We also attempted to record war and other casualties away from home. Finally, we recorded natural population changes by extracting details of births and deaths from the official registers for the period October 1939 - December 1958 (the 1959 registers were not available). The results are summarised in table 50.

166 Our record of migration depends on the memories of our informants and cannot be expected to be complete, nor can the 1939 (National Registration) population figure be

166 island girls bringing mainland men to settle in the island are rare indeed. Thus migration remains, as it has long been, a one-way traffic and this is almost certainly related to the problem of establishing technical innovation*.

Age structure

162 The age structure of the population reflects the changes that have taken place in recent 121 years. The population of Uig, as is usual in areas of declining population, is ageing. It is one advantage of a survey such as ours that the data may be analysed in greater geographical detail than is possible from the published figures in the official Census reports. This is particularly important in the crofting region where neighbouring communities may show quite different demographic - and economic - trends. Table 52 compares the 1951 Census figures for rural Lewis with those of Uig parish and with certain other districts, one (Park) remote like Uig, the other (Point) being most accessible to the urban facilities and employment offered by Stornoway. Uig has an even greater proportion of old folk than has Park, but it also has more children. This is probably related to the smaller proportion of Uig's population finding it necessary to leave the parish in search of work (16%, compare 28% from Park).

The proportion of the population over 65 years of age has increased from 17% in 1939 to 21% in 1959; it is thus more than twice the national average and well above the figure for rural Lewis. The proportion between 45 and 64 has also increased whilst that between 15 and 44 has markedly declined. The actual number of persons aged between 15 and 44 had declined from 1,263 in 1939 to 752 in 1959. It is to this age group in particular that one should look when seeking economic development but it is by no means certain that this decline is an unmitigated evil.

TABLE 52

Age distribution

	Percentage in each age group: 0-4	5-14	15-44	45-64	65+	
Scotland	9.0	15.0	43.0	23.0	10.0	Census, 1951

[113] * For discussion of this topic see Caird J.B. and Moisley H.A.: Leadership and innovation in the Crofting Communities of the Outer Hebrides, Sociological Review, Vol. 9 1961, pp. 85-102.

Employment - the search for work

121 When an island community outgrows the local intrinsic resources permanent emi
464 is not the only solution. It is one of the outstanding demographic characteristics of
166 island communities that a proportion of the population seeks employment beyond the
whilst maintaining its island homes. We therefore classified the population, in the
place, according to whether it was:

(a) permanently resident in the parish

(b) leaving the parish seasonally or otherwise irregularly in search of work, an

(c) working permanently away yet without a permanent home except in the parish

TABLE 53

Location of employment

Lewis and Harris

121 to the world within. Above all, harmony of relations, at
771 every stage of life, in man and woman, was felt to pre-
181 figure relations with the Divine. The religious poetry of which the Gael were the creators and heirs, promoted courage and calm. True, its very power could lead to superstitious respect for mere forms of words, debased as 'magical' charms. Such misuse was 'superstitious', being false in itself and falling short of the clearest thought, the highest aspiration, of the time and the community. Worse still, use with evil intent could concentrate ill-will and evoke mutual fears. Yet at its best, thought was clearer, less confused, than is commonly imagined. To the aspiration and attainment of the Gael—in congregation or solitude, in meditation or labour, in love and faith or in works—the fragments of their oral heritage bear witness.

(c) LITERACY AND EVANGELISM: 'THE MEN' AND THE DISRUPTION

175 From before 1680 "a school for the gentlemen's sons
178 and daughters" was open in Stornoway. Latin and
871 English were taught, and a century later even Greek had been added, as recorded by W. J. Gibson, for many years Rector of Stornoway's high school, the Nicolson Institute, in his *Education in Scotland*, 1912 (chap. v). Particularly towards the end of the eighteenth century, the Gaelic School Society and other bodies, like the Society for the Propagation of Christian Knowledge, sent out schoolmasters to teach the reading of the Scriptures. Industrial schools were set up at the same time by Lady Seaforth, to teach spinning
671] by the wheel, replacing the slow distaff. It was not till nearly a century later that teaching of English was widely taken advantage of—partly by the compulsion of the

175 saint, a character so eminently Christ-like",[1] and to his
793 intimate beliefs, doctrine and wide influence. The same
159 Highland roots and deep charity characterised Dr. Norman Macleod, author of the popular classic, *The Friend of the Gael* (*Caraid nan Gaidheal*).

• 121 If a student of community ventures upon an interpretation of theology, it is because, to him, any attempt to understand "the relations of God to mankind" must take account of men's relations to one another. Ideas are transformed by human experience during economic and social revolutions, and in their turn they transform society. To make contact with reality, theology must regard mankind: it
175 must be integrated with sociology. Because of its close
178 bond with communal life, the religious spirit, recorded in Gaelic lore, was jarred, almost overwhelmed, when com-
182 munity was shaken to its foundations by the commercial, agricultural and industrial revolution. Happily, the value
178 of communal Christianity has been acknowledged both by
79 Roman Catholics—notably (among Gaels) by the Rev. Allan Macdonald of Eriskay—and by Protestants.[2] In the Scottish Presbyterian Church today, the movement which seems most deeply aware of the need for a new society has acknowledged its debt to communal tradition where this has been best maintained, that is, in the Isles. Seeking to aid Christian endeavour, international and national, this movement has turned for inspiration to Iona.
[771] In Iona, of which the noble cathedral belongs to the Church of Scotland but is open for service to all denominations, Presbyterians have found a new symbol.

[113] [1] Canon Vaughan, cited by the Rev. Norman Maclean (*Scotsman*, 21st Aug. 1943).

[2] "The Church should interpret the Love of God by a flaming zeal for the redress of the social order." (The Very Rev. Prof. John Baillie, Moderator of the Church of Scotland, at St. Andrews, 1943.)

by the ability of the culture to maintain its form in the face of changes in content.

The inhabitants of the Isle of Skye, of course, should not be regarded as possessing a folk culture. To do so would make an airy nothing out of a concept already so indefinite that its usefulness is suspect.[9] They are, however, much akin to European peasants. Like European peasants in general,[10] the Skye crofters have lost much of their isolation, their former political independence, and their self-sufficiency. At the same time, they have retained a good deal of their former identity, a continuity of culture and an attachment to the land and to the traditional way of life. This is true despite chronic social instability and a passage through two periods of threatened social and cultural disintegration. The breaks proved to be only temporary. They involved the creation of a new cultural focus to replace the former integrative pillar in the first period and later a reaffirmation of the new focus. This does not mean there was a lapse of continuity. A comparable situation is found in the culture history of the Pueblo of Southwestern United States. Archaeologists tell us that the sequence has been broken, in particular at the end of the Pueblo III when the culture underwent a reorientation and a shift in locale. Even though the Pueblo were never again to live in the San Juan River drainage and

were to accept a number of significant developments in material culture and religion, their tradition was preserved to be handed on to their living descendants. Not all cultures have succeeded in averting the ultimate disaster. When speaking of those of the Northwest Coast, for example, it is now customary to use the past tense. The cultures have lost their continuity and with it their identity.

Essentially, the first assumption to be kept in mind when reading this thesis is that a culture may be subjected to social upheavals, economic calamity, and remarkable changes in content and yet persist and remain recognizable through the years. A further exploration of the concepts of social and cultural integration and disintegration will facilitate our mutual comprehension of the problem.

Social and Cultural Integration

By implication, I have acknowledged the necessity of distinguishing between the concepts of "society" and "culture." Although anthropologists have not yet reached full agreement on this question, I believe the distinction to be important in a study of cultural continuity and population change if we wish to avoid ambiguity. In many ways, the dispute over what is social and what is cultural, as Kroeber has observed, stems from an embroilment with names rather than with principles.[11]

[11] A. L. Kroeber, "Concluding Review," An Appraisal of Anthropology Today, p. 365.

The difficulty is a lack of explicitness in using the terms in both anthropological and sociological literature.[12] They are frequently used interchangeably or are accepted as two ways of viewing the same thing.[13] From my point of view, which reflects the attitudes of many leading anthropologists, society and culture are logically separate though complementary concepts.[14]

Except on the infra-human biological level, there is no society without a culture. At the same time, man becomes a carrier of culture as a member of a society. Indeed, we abstract culture from the collective behavior of the members of the society.

There are no really significant differences of opinion concerning the nature of society and culture among those who distinguish between them.[15] A society is a group of people who have a sense of esprit de corps or belonging which results

from living together in an organized group and cooperating
accordance with well defined patterns of interpersonal inte
action. Culture is generally accepted to mean the socially
transmitted conventional attitudes, behavior patterns, and
techniques which are distributed among the members of a soci
in accordance with their status positions and sub-group mem
ships.

If it is agreed that society and culture are separate
though complementary and interrelated concepts, then, social
and cultural integration do not necessarily have to go toget
The culture may be integrated but incompatible with the
capabilities of the members of the society, or the members o
the society may not be enculturated. The social aspects und
such conditions would appear to be disintegrated.[16] Kroeber
used France in the days of the Revolution as an example of a
society which lacked solidarity but had an integrated cultur
in pointing out how the two rather tend to go together.[17] T
same argument is applicable to the problem of social and
cultural stability. As Steward has pointed out, cultural
stability cannot be measured by the criteria used in deter-
mining social stability.[18] The size of the group may increa
or decrease without seriously disturbing the cultural patter

For further clarity, a pause to define my terms is in
order. Except to Benedict, who emphasized the manner in whi

[18] Op. cit., p. 42.

heterogeneous traits were formed into a congruous shape by their becoming characteristic of the goals of the culture, and, hence, saw integration in terms of emotional and intellectual motives,[19] cultural integration is normally judged in terms of functional relatedness. In other words, culture traits, complexes, patterns, and aspects are considered integrated to the extent that they are meaningful to the individual carriers of the culture.[20] The antithetical condition is cultural disintegration. The basic pattern of the culture separates into fragments; continuity is lost; and the culture disappears. Between the two states of being I find it expedient to single out cases of cultural instability and cultural disorganization. Since all cultures are continuously undergoing change, instability is best reserved for phases of frequent, dynamic modifications. The outcome of instability is disorganization, a disturbance of the systematic structure of the culture. Unless there is a readaptation, disorganization begets disintegration.

These four cultural conditions have their social counterparts.[21] An integrated society is one in which all the members are coordinated into a unified whole; they are bound together

[19] Ruth F. Benedict, Patterns of Culture (New York: Mentor Books, 1948), p. 42.

[20] See, for example, Raymond Firth, Elements of Social Organization (New York: Philosophical Library, 1951), pp. 33-35; and Gillan, op. cit., pp. 498-531.

[21] Henry P. Fairfield (ed.) Dictionary of Sociolory (Ames, Iowa: Littlefield, Adams and Co., 1955).

by a network of relations.[22] The opposing condition is social disintegration. The group no longer has any common interests, and the society is fragmented. I shall use social instability to refer to the departure of people from the total group or any subgroup by either upward or outward mobility. Social disorganization is a disturbance of the interpersonal relationships which make for harmonious living together.[23] Most societies probably experience some degree of instability and disorganization at some time or another.[24] It is only when the latter condition is chronic that disintegration appears.

Of all the foregoing states of being, cultural disorganization has proved to be the most thorny problem. The same culture can be described as reorganized or disorganized by different investigators. Two studies of a single community amply demonstrate this fact. Redfield, in his first formulation of his concept of "folk culture," described the village of Tepoztlan in an organization - disorganization framework.[25] He was interested in the changes which urban influence brought about in the folk culture.[26] Tepoztlan, it might be added, was regarded as representing a medial cultural type between the

[22] Eggan, op. cit., p. 6; Gillan, op. cit., pp. 498-515.

[23] After writing the above, I discovered, at the suggestion of Charles Wagley, that my handling of the organization-disorganization continuum is somewhat similar to Merton's concept of dysfunction. See Robert Merton, Social Theory and Social Structure (Glencoe, Ill.; Free Press, 1949), especially Chap. 4.

[26] Ibid., p. 13.

primitive tribe and the modern city not unlike peasant communities in undeveloped areas of the world.[27] Almost twenty years after Redfield's study, Lewis returned to Tepoztlan to investigate recent modifications.[28] Changes there were, but Lewis also discovered factual discrepancies and found himself differing with Redfield in the interpretation of the evidence. The result was a re-study of the village which advanced the conclusion that there was no reason to speak of disorganization. The changes rather involved a new kind of organization.[29]

It would appear, then, that if the anthropologist is concerned only with changes seen from the perspective of a supposed pre-contact situation, he may decide, as Redfield did once again in Yucatan,[30] there has been disorganization. Lewis is not the only one who has questioned the validity of this approach. Gross has found severe limitations in Redfield's concepts of organization and disorganization because they force the analysis into an organization-disorganization framework and neglect the possibility of the existence of different levels of organization in cultures.[31] Steward, who has, perhaps, been the most explicit exponent of levels of sociocultural organization, prefers to take the larger cultural framework of which the disorganized culture becomes a part as his point

62 appropriate age-group, males on the left, females on the right. The width of the bars
26 varies according to the age-range of the groups so that the length of each bar gives an indication of the relative importance of the particular age-group in the total population. In an unofficial survey it is difficult to obtain detailed information as to age; hence the diagrams are crude, nevertheless they do suggest certain trends, as well as marked regional differences, within the parish.

62 If we examine first the parish as a whole it will be seen that the proportion of children under school age, (0-4), is sufficient to maintain, and perhaps to slightly increase, the school population (5-14) provided that none are lost through emigration. The present school population is not quite sufficient to maintain the 15-44 age-group, including, of course, those working away, on the same assumption. In both these groups, as is usual, males slightly outnumber females.

The characteristics of the 15-44 age-group are clearly seen. A large number is working away from home; the proportion of women working away is far greater than of men and, in view of the "marriage risk" to women in this age group, it is reasonable to suppose that, in time, most of these women will become 'emigrants'. More men stay at home (weaving supports many of them) and, of those that go away to work, a substantial proportion is likely to return either on inheritence of a croft or when they retire; some of them may bring back wives from outwith the parish but it seems unlikely that this will by any means balance the loss of local women by marriage outwith the parish.

The 45-64 age-group is only slightly affected by the custom of working away. Men and women are evenly balanced, but when we compare them with the 15-44 group it seems that, in the next ten years or so, there will be a decline particularly in the number of women aged 45-64. Indeed, if most of the women under 45, who are at present working away, eventually marry and settle outwith the parish, the decline will be drastic. The 45-64 age-group should, in time, replenish the over 65's; it is clear from the diagram, crude as it is, that this is not possible. At present an excessive proportion of the population is over 65 years of age and thus, in time and failing the unlikely event of substantial immigration, a further fall in total population is certain. One may hazard a guess that this decline will be of the order of 300 to 250 persons in the next ten years.

Turning to the districts, the most striking feature is their individuality and this emphasises again the value of this kind of survey because such local details cannot be discovered from the official census reports. In South Uig, of the total population, a very high proportion is over 65 years of age; this makes it certain that further decline is inevitable. However the 15-44 group can probably replenish and maintain the 45-64 group with little loss; the relatively high proportion of children, particularly under school age, suggests that the 15-44 group, too, will be adequately replenished, except that there is an unusually low proportion of female children. A large proportion of young women from South Uig take employment away from home, as the diagram shows, and this suggests that South Uig may have a special problem here in view of the tendency of such women to marry and settle away from home. The Bernera district shows characteristics similar to South Uig, but the preponderance of children is not quite so great.

The East Loch Roag district, and to an even greater extent the Carloway district, has the different characteristics which suggest rather different trends. There the preponderance of old people is not quite so great - but, one may remark in passing, the excess of females over males in the over 65's is quite astonishing until one recalls the heavy casualties, amongst the Naval reservists and others, from this area in the First World War. If we look at the proportion of children, however, it is clear that the school population can scarcely be maintained over the next ten years, nor can the 15-44 age-group fully replenished. This, of course, assumes that there will be no material change in birth and death rates, nor in migration. In brief, it seems that, although population will probably continue to fall in South Uig and Bernera, the prospect of a more stable, though smaller, population is within sight. But in East Loch Roag and Carloway districts it is likely that decline, though perhaps not so rapid, will continue for a long time yet.

FOREWORD

Many are aware that the small scattered communities of the Atlantic fringe of Scotland still pursue an uncertain livelihood by farming under the system known as crofting. There are many, too, who know that the system is in decay and that steps must be taken if the economic decline which threatens these communities with ultimate extinction is to be arrested. Yet, despite various proposals for improvement, the exact nature of the crofting system itself has never been fully investigated. Clearly it is important to do so and the best way of achieving this is by a full survey of the existing conditions. A valuable start was made in the West Highland Survey by F. Fraser Darling which appeared in 1955. In 1956, more intensive studies of particular crofting areas were begun by members of the Department of Geography of Glasgow University under the direction of Mr. H. A. Moisley and Dr. J. B. Caird who thereby initiated the Crofting Survey. Studies were made in Benbecula and South Uist in 1956, in Barra in 1957, in Harris and Waternish (Skye) in 1958, and the value of a team of geographers for such work has been amply demonstrated. For the first time, moreover, survey and mapping techniques were applied to the township as the working unit, for the township is the real basis of the crofting organisation.

114 121 The success of the South Uist project made these further surveys desirable and another opportunity occurred in 1958 when the organisers of the Crofting Survey invited the co-operation of the Geographical Field Group in making a study of the Park district of the island of Lewis. The Geographical Field Group gladly responded to this invitation to contribute to a field study so closely consistent with its own aims and practice. The members of the Group who took part in the survey did so with a strong sense of purpose, recognising from the outset that the Crofting Survey deserved serious support. Together with members of the Department of Geography at Glasgow they made an effective team. The results of their study which forms the subject of the present report, ably prepared by Dr. Caird, make an impressive record from which there already emerges a clearer understanding of the crofting problem. The report is worthy of wide recognition and it is to be hoped that it will be followed by others dealing with different areas.

K. C. EDWARDS

President, Geographical Field Group.

INTRODUCTION

121 Since 1955, staff and students of the Geography Department, Glasgow University, have been engaged in a survey of Crofting Districts. This survey is intended neither to rival nor to replace the work of Collier and Fraser Darling, but to supplement their studies by more detailed field work: in the areas selected every croft is visited; so far, including Park, 2,250 crofts have been recorded.

After the publication in 1957, by The Scotsman, of two articles on South Uist by Mr. H. A. Mosley, the Pairc Association inquired whether a similar survey could be carried out in their area of Lewis. Initial arrangements were made by Mr. Mosley, with the co-operation of Mr. MacMillan, secretary of the Pairc Association, and eleven members of the Geographical Field Group spent almost three weeks of their summer holidays working in Park, led by Dr. J.B. Caird, assisted by Miss Catherine B. Smith. The party worked in small groups, each making a particular study of one or two townships. Neither croft nor township boundaries are recorded on any published map; these were obtained so that land use and house sites could be plotted on 1:2500 plans; details of crops and stock were recorded for every croft and an enumeration of population made for each household, the latter being done by Dr. Caird as a rule, with the help of local residents. Only in this way can a true picture of contemporary crofting be obtained, for official sources, such as the Census and annual Agricultural Statistics, deal mainly with counties, only occasionally with parishes, and never with townships. Yet it is the township groups which are the essence of Crofting.

114 The people of Park showed great kindness in answering innumerable questions with truth and good humour. Their hospitality was quite overwhelming: without their willing co-operation this study could never have achieved any degree of completeness. It would be invidious to mention any single member; all did their utmost to help. But without Mr. MacMillan nothing would have been possible. It was he who found accommodation for the party in a community where tourist accommodation is almost unknown, and for this, and for much other help, we owe him a great debt. To our hostesses, Mrs. Campbell, 13 Gravir, Mrs. Macaskill, Heatherview, and Mrs. Macaskill, 13 Glengravir, we are perhaps in the greatest debt: they looked after us so very well and unsparingly. And from them we learned the values and outlook of the Park community. By way of preparation, much help was given by Mr. D.M. Mackinnon, the estate factor, by Mr. Donald Mackay, 11A Kershadir, by the staffs of Messrs. David Macbrayne, of the office of the Registrar-General for Scotland, of Register House, of the Department of Health for Scotland and, in particular, of the Department of Agriculture for Scotland. Finally, thanks are due to Miss Bridget M. Gordon, B.A., B.Litt., for the appendix on place names, and to the practical agriculturalist who made an assessment of the agricultural economy possible.

The township reports were prepared by the individual members and the editor contributed the general chapters. The editor would like to record here his personal thanks to the party. Few leaders can have been blessed with such cheerful enthusiasm, steady application and willingness to work long hours; they mastered the methods and techniques of the survey extremely quickly and added new ones. The quality of their field work may be judged from their reports. The checking, organising and filing of the data both in the field and afterwards, as well as the preparation of the tables for the present report, could not have been done without the skill and enthusiasm of Miss Smith. Thanks are also due to Mrs. Esme Diamond and Miss Smith for typing the draft and especially to Mr. I.A.G. Kinniburgh, Cartographer in Glasgow University Geography Department for re-drawing the maps and diagrams.

000 The value of the field work lies not only in the present report, but also in the permanent statistical and cartographic record in Glasgow, to which we hope present and future research workers will be able to refer.

[Orinsay]

253 The future existence of the common pasture for grazing is being seriously endangered by overstocking. The souming is not enforced in Orinsay and the actual sheep stock exceeds the souming by 300 per cent. Peat-cutting is gradually destroying valuable grazing areas; in the last three years there has even been some peat cutting on the better grazing on the island. The dangers both of overstocking and of indiscriminate peat cutting cannot be overstressed.

No evidence was seen of attempts to improve the quality of the common pasture. The establishment of shelter belts would provide not only shelter but a means of stopping the peat from 'slumping' down slopes if they were carefully sited. Much of the common pasture could be improved by a hill drainage scheme and by re-seeding, after sanding and liming, a project well within the capacity of the resident labour force.

Good crops on a few of the crofts suggest that the land is not inherently sterile, however, and it would seem that if the holdings were reduced to a maximum of four, an economic existence might be feasible on these crofts. The stony nature of the soil limits the possibilities of tractor cultivation but with an improvement in drainage, one might be used in the two valleys.

It is not so easy to be optimistic about the employment of surplus population resulting from such an enlargement of holdings, although a revival in the fishing industry could absorb most of the men. At present there are no looms in Orinsay and providing the Harris tweed industry can hold its own there are possibilities in weaving. Seaweed is in plentiful supply, indeed Lemreway people also obtain supplies and should its quality prove adequate, the establishment of a processing plant would provide valuable employment.

000 Nevertheless it is becoming increasingly obvious that unless the holdings can be enlarged, whether officially or by sub-letting, and some further employment created, Orinsay is liable to stagnate, and depopulation to continue. The township which was developed to relieve congestion is now itself congested.

SUMMARY AND CONCLUSIONS

121 The aim of the Glasgow University Department of Geography Crofting Survey is to record and analyse material relevant to the crofting districts, and in so doing provide a clear and impartial statement of the present situation. In inviting us to undertake a survey of Park, the Pairc Association hoped that a body of fact would be secure in more favourable circumstances drawn which would assist the Association in their admirable aims of advancing the well-being of the area. Their two Progress Reports, of 1956 and 1957, indicate that they have already investigated many of the possibilities for development. This summary refers to Park alone, and, it must be emphasised, until the survey of crofting is completed, no final assessment of the Crofting Area as a whole can be made.

122 The district of Park is one of the more isolated and difficult crofting environments. The ruggedness of the terrain, the high proportion of land of very low agricultural value and sheer isolation make the existence of human communities precarious. In addition, many of the Park communities were first established as a result of population pressure in the more favourable areas of Lewis, and the original small settlements grew rapidly as a result of a change in land use which was a national trend - the conversion of poorer areas from subsistence farming to an extensive sheep-rearing economy. The impact of this change came to Park in the form of the eviction of a large body of small farmers in favour of an extension of the grazing area. Thus the present conditions are a legacy of the relatively recent past, and of legislation, particularly in the Crofters' Act of 1886, which accepted, and tacitly agreed to the maintenance of a larger population than the land could reasonable carry[1]. Two World Wars and fluctuating economic factors have had repercussions in Park and resulted in a change in economic and social values, and depopulation has resulted: the 1951 population was 60 per cent of the 1911 total.

1. The Commissioners proposed that only holdings rented at £6 and over should have security of tenure, with a view to discouraging the perpetuation of grossly uneconomic holdings; in the Act, all holdings were given security of tenure.

ABSTRACT

Cultural Continuity and Population Change on the Isle of Skye

Paul Richard Ducey

121 This study is concerned with the effect of population change on the culture of the essentially peasant society of the Isle of Skye, one of the Hebrides of Scotland. Standing on the very fringe of Western Europe, this particular surviving remnant of the once widespread Celtic culture has experienced a familiar consequence of the impingement of the social and economic forces 16 of urban and industriel Western Civilization. Involvement in the process of westernization brought a rapid, accelerating increase in the size of the population. Failure to make the required cultural adjustments led to persistent depopulation. 121 From the many problems created by the swing of the population pendulum, this study singles out one of particular anthropological significance. The thesis is that population change is not necessarily a criterion of cultural discontinuity. Although one case study cannot prove this assertion, future research along similar lines in other cultures marginal to the main stream of Western Civilization may reveal a wider applicability of the 00 thesis. The material presented in the present study was collected during a year of field and library research in 1953 - 1954.

121 The approach to the problem is oriented toward the culture 128 history of the Skyemen. Following a brief comparative description of the contemporary culture, an attempt is made to reconstruct

/p. i-A/

121 the culture as it functioned in the days when the clan system 128 was an all-pervading influence in the lives of the people. This is intended to provide the necessary perspective for the ensuing processes of cultural change by revealing the essential features and the form, the distinctive pattern, of the culture. The stage set, four periods of social and cultural change, spanning over two centuries (1745 - 1953), are reviewed. The purpose is to analyse the extent of acculturation under the influence of the commercial and, later, industrial society of Great Britain. Throughout, emphasis is placed on population change and cultural continuity. Having established the main social and cultural trends, the economic, social, and religious aspects of the present day culture are examined in some detail for an understanding of its continued distinctiveness. The intention is to present not only the evidence for continuity, but also to point out the problems associated with the preservation of a cultural heritage no longer en rapport with the Western World.

121 The author's conclusions close the study. Despite chronic social instability, economic calamity, and striking changes in content, the culture has persisted and remained recognizable through the years. Although there have been periods of social disorganization and threatened cultural disintegration, irreparable disorganization has not been a characteristic of the culture. Obviously, the culture today is not identical with that of two hundred years ago, but the essential features which gave the culture its distinctiveness then do so today. Continuity has been preserved through a reintegration. In part, this

/p. i-B/

121 represents an incomplete adjustment to the more complex socio-cultural organization of Great Britain. The Skyemen have remained enisled geographically and culturally. As in other simple, isolated, kinship oriented societies, an adjustment has been made in the traditional culture. The most important factor in the preservation of continuity has been congregational religion. While Presbyterianism, with its stress on asceticism, has curtailed and modified many characteristics of the culture, it has provided a new focus to replace the clan. Furthermore, it has helped to preserve the essential features of the culture and maintain continuity by sanctioning the values important to the people. The culture is growing old with the people. The deviants, mainly the youth, who will not conform to the traditional values are being rejected. Social instability is a penalty for remaining peripheral to the Western World.

PREFACE

121 The problem which I have attempted to treat in this study concerns the question of the effect of population change, both increase and decrease, on an essentially peasant population living on the very fringe of Western Europe in one of the last remaining outposts of the Gael. My interest in this problem, stimulated to no small degree by Dr. Conrad M. Arensberg and my wife, stems from an old curiosity about the nature and function of the Highland clan system and the characteristics of a small, [101] dying remnant of a once widespread culture. My wife and I went to Scotland in June, 1953 to conduct field research on the Isle of Skye with the presupposition that the old culture had not withered and disappeared, even if it had been seriously modified by outside influences, especially those flowing in from the [101] wider society of Great Britain. We remained on the Island until March, 1954, when we turned our attention to library research and exiled Skyemen in Glasgow.

122 The research embodied in my dissertation was made possible by financial assistance from Columbia University, in the form of a William Bayard Cutting Traveling Fellowship; from the Social Science Research Council, in the form of a Research Training Fellowship; and from the United States Educational Commission in the United Kingdom, in the form of a Fulbright Scholarship. I

CHAPTER I

INTRODUCTION

The Problem

121 The impingement of the social and economic forces of urban and industrial Western Civilization on folk and peasant societies has a familiar consequence, the inauguration of a population cycle. Frequently, these societies experience a rapid, accelerating increase in their size. If westernization is allowed to proceed, the burst of growth may continue, perhaps at a slower rate, over a prolonged period. In marginal areas, however, there are societies, and segments of larger societies, which are unable to make the required cultural adjustments. In these, entanglement with the Western World eventually leads to persistent depopulation. There can be no doubt that the swing of the population pendulum creates a host of problems. Among the doubtful questions there is one of particular anthropological significance: Is marked population change a sign of cultural discontinuity? This dissertation is dedicated to the purpose of answering this question. My thesis is that population change is not necessarily a criterion of cultural discontinuity. Although I shall examine only one case, future research along similar lines in other cultures may reveal

121 a wider applicability of my thesis. The evidence in support of [101] my assertion was collected on the culture history of the Isle of Skye, a part of the area known as the Highlands and Islands of Scotland.

101 Since I shall frequently speak of the Highlands and Islands in the following pages, we should have a precise definition of the [133] region (Figure 1). Geographically, the Highland boundary should be placed at the Great Highland Fault, a series of geological faults which extend across Scotland from the River Clyde to Stonehaven, south of Aberdeen. Politically and economically, [23] however, this line has receded to the north and west. Since 1883 it has been common in Scotland to equate the Highlands and Islands with the "Seven Crofting Counties," those counties in which the [24] predominate form of land use is the crofting system. Crofting may be defined as a system of hereditary tenure of a few acres of arable land combined with common tenure of hill grazings. [25] These counties are: Argyll, Inverness, Ross and Cromarty, [26] Caithness, Sutherland, Orkney, and Zetland. Out of the 163 parishes in these counties only 12 are considered non-crofting.[1] [14] In addition to this shared socio-economic pattern, the seven counties have experienced common economic-geographical influences, a century of accelerating population growth, followed by a century of persistent depopulation.

[1] John Collier, The Crofting Problem: A Social and Economic Study (Cambridge: Cambridge University Press, 1953), p. 11n. A parish in Scotland is an ecclesiastical district which until 1929 was also a civil unit with self-government in such local affairs as education, relief for the poor and infirm, and health. If the British county is thought of as analogous to an American state, the parish can be thought of as a county, but one devoid of any function.

The Continuity of Culture

121 Prerequisite to an understanding of the problem is an acceptance of a general characteristic of culture. All culture and every specific culture has behind it a connected, coherent developmental sequence. Any culture which has failed to maintain a genuine continuity has soon disintegrated and disappeared.[3] In order to preserve this necessary degree of continuity, this single tradition,[4] if you prefer, the culture must accept and value its past. At the same time, the culture is normally receptive to traits and trait patterns which have come into the culture from the outside world and can be integrated within the form of the culture. No culture, unless it is decadent, is static.[5]

In these days when many individuals outside our discipline and not a few within anthropology are haunted by the spectre of one world with a more or less uniform culture, it is particularly important to ask how cultures and subcultures outside the main stream of Western Civilization avert the ultimate disasters of discontinuity and disintegration. Steward has provided one answer. He theorizes that "folk societies and folk cultures" are modified by way of readaptation

[3] A. L. Kroeber, Anthropology (New ed., rev.; New York: Harcourt, Brace and Co., 1948), p. 257.

121 to the higher level of socio-cultural organization of which they become a part rather than disappear.[6] Thus, although they acquire new characteristics and witness the total or partial supersession of many formerly typical traits and complexes, as the process of westernization proceeds, they preserve, at least, a recognizable residue of their identity. Wagley and Harris have employed an analogous argument.[7] They conclude from an attempt to classify Latin American subcultures that cultures of a tribal (a refined classification to replace folk) or peasant type change "in their cultural content and in their relative importance to the wider cultural scene," but remain distinctive.[8] Now, it seems to me, most contact situations have involved profound cultural and social disturbances. There is bound to be a loss of homogeneity. Instability, caused by too many changes coming one on top of the other and by the activation of a population cycle, is all but inevitable. Under such conditions, if a culture is to maintain continuity, it frequently has to readapt not only to the higher level of socio-cultural organization but also to the older way of life. I, therefore, suggest that when an isolated, relatively simple, kinship oriented culture experiences a period of instability, discontinuity is avoided

of departure.[32] He used this methodology in Puerto Rico and concluded that the culture exhibits a readaptation to the high organizational level and a reintegration into the national culture.[33] The individual carriers of the culture assume specialized roles in a more complex, heterogeneous system. To all intents and purposes we are dealing with a problem similar to that of simple cultural change. Change must be measured against stability, and stability can only be understood when change is gauged against cultural conservatism.[34] In either type of study the conclusions reached will depend to no small degree on the stress of the investigator.

Shortly before World War II, an attempt was made by a group of anthropologists and rural sociologists to analyze cultural integration and disintegration. The result was the Rural Life Studies. The six studies had for their objective the investigation of factors which facilitate or impede change, contribute to adjustments or maladjustments, and make for social stability and instability in the individual and rural community.[35] Instead of making studies of culture the

d workers studied social groups which manifested extreme
al stability and instability.[36] Their criteria were economic
sufficiency, associational groupings, influences from
national culture, and population movements. Two of the
rts are particularly pertinent to my thesis, the Old
r Amish, in Pennsylvania,[37] and the town of Landaff,
Hampshire.[38]

The Old Order Amish were the only people in the series
were bound to each other by a cultural tradition. They
considered to represent extreme cultural integration
n was ascribed to their common background, language,
tion, and religion; to their strong kinship ties; and to
r devotion to the Old Order, epitomized by their religion,
n rejected the modern world. Steward regards them as an
ple of cultural stability and social instability.[39] Over
years the deviants have been rejected as a means of re-
rcing cultural conservatism. As we shall see, this
ural defense has been in operation on Skye. Furthermore,
Old Order Amish and the Skye inhabitants have been able
aintain not only cultural integration, but also social
gration, by casting off the nonconformists. The
nts would not only change the culture, but they

on. This brings us
Durkheim's concept

12 of anomie.

According to Durkheim, a disorganized society has the following characteristics: a deterioration of the traditional habits of interpersonal interaction with members of the group, a low degree of social contact among the group members, and a loss of social control.[40] In a word, there is normlessness. As a result, the individual finds himself caught between conflicting ideals and values. The question is, how much of this is cultural? There appears to be two alternatives. On the one hand the individuals in the society may have an integrated culture, but they may not be enculturated or their refusal to follow the patterns of the culture may render the norms and sanctions impotent. On the other hand, the culture may have disintegrated because of a disruptive transition. In either case there would be anomie. This concept, by the way, must be considered relative and applicable only to situations in which the disorganizing forces threaten to overwhelm those favoring integration.[41] Durkheim's theory of anomie has been used in several recent analyses of groups which have experienced social instability and the impingement of economic forces from the outside in common with the Isle of Skye. Homans employed the concept to analyze the social "disintegration" (disorganization) of a small New Hampshire hill farming town.[42] Loomis and Beegle have used it as a means of explaining the growth

121 and spread of fundamentalist religion, which they regard as a counteragent for social disorganization.[43] I, too, shall make use of this theory to show that there has been threatened social disintegration on Skye and a reintegration despite continued instability. The individuals who remain and those who return in later years, as many do, are fully enculturated. Further, if my supposition regarding the relation of cultural disintegration and anomie is correct, the existing social integration on the island is an additional support for my argument that population change is not a criterion of cultural discontinuity.

To summarize, the points I wish to emphasize concerning social and cultural integration or the lack of it are six. Society and culture are separate though complementary concepts. A society is an organized, cooperating group of people; the way of life they follow is their culture. Social and cultural integration tend to go together, but they are independent variables and must be judged by different criteria. Cultural disorganization is a much debated condition. Using the concept of sociocultural levels, the importance of disorganization shrinks in favor of reorganization and readaptation. Finally, the concept of anomie, normlessness, can be used to determine whether or not there is threatened social disintegration, and it may provide supporting evidence for cultural continuity.

161 with many of its neighboring Caroline Islands.[45] A similar tendency has been reported for the Aleutians.[46] On the other hand, there are the Pueblo,[47] who have recently begun to increase, and the Navaho,[48] who have grown in numbers at a rate no less striking than the decline of innumerable tribes in the non-Andean areas of South America.[49]

121 161 Although the fate of any one community in contemporary United States may be insignificant to the social scientist who is interested in culture change, social instability among folk and peasant peoples is a factor which should not be overlooked. I am certain that it is not a criterion of cultural discontinuity, unless the tribal or peasant group suffers complete obliteration. I am equally sure that it is commonly symptomatic of cultures which have been unable to make a complete adjustment to the new and higher sociocultural organization reaching down to them. Some tribes, it is true, have succeeded in making a pretense at adjustment. Noted for

Kroeber, Cultural and Natural Areas of Native North America, ("University of California Publications in American Archaeology and Ethnology," Vol. 38; Berkeley: University of California Press, 1939), pp. 131-181.

121 161 preserving a good deal of their complex culture, the Pueblo and, in particular, the Navaho have increased in numbers. The isolation of an inhospitable environment will not fully explain their conservatism without instability. One after another, even more isolated Aleutian villages have disappeared. Those which have experienced social instability and disintegration have paid the penalty for preserving too much of their traditional culture. In Aleutian villages where the traditional culture has been largely replaced by western ways social disintegration is, at present, unknown.[50] Depopulated Yap is, perhaps, the most familiar case of persistent refusal to adjust to the impinging Western World.[51] All over Europe there are peasant peoples who are facing an identical situation. Techniques for complete adjustment to their larger sociocultural groups are unavailable. Still tied to the land and their old ways instead of to 1955, they are slowly dwindling in numbers. In all of these cases of social instability the culture is growing old with the people. The deviants, the individuals who will not conform to the traditional behavior patterns and norms, leave, and they are mainly the youth. Whether or not there is always a change in the focus of the culture such as occurred on Skye I am not able to say, but, doubtlessly, there are always changes in content as a part of the process of reintegration. Nevertheless, the form, the

121 basic distinctive pattern, of the culture is preserved and
161 continuity is maintained.

The Organization of the Thesis

128 My approach to the problem of cultural continuity
121 despite marked population change is oriented toward the culture history of the Isle of Skye. To this end, in the next chapter (Chapter II) I shall describe the environmental limitations of the island and, briefly, present a comparative analysis of the economics, settlement pattern, social organization, and religion of Skye. This is intended to acquaint the reader with the local culture and provide a perspective for the following chapters. In Chapter III I shall be concerned with the culture as it was before the commercial and developing industrial society of Great Britain became a significant acculturating influence, that is, before 1745. Chapter IV is devoted to a review of four periods of social and cultural change following the introduction of the tenets of commercialism. Throughout the chapter emphasis is placed upon cultural continuity despite population increase and then decrease. The continuity will be shown to have been preserved over two hundred years, even though there were two periods of threatened cultural disintegration, chronic social instability, and several periods of social disorganization. Having established the main social and cultural trends, the contemporary culture is examined for an understanding of its continued distinctiveness. In Chapter V, the contemporary economic

CHAPTER III

SKYE IN THE DAYS OF THE CLAN

If we are to understand the continuing distinctiveness 121
of the contemporary culture, we must attempt to reconstruct the culture of the remote past and point out the plausible sources for the more distinctive traits and patterns which, upon becoming integrated, became characteristic of the culture. This chapter, then, is devoted to a description of the social 128
organization, economics, and religion of the Sgiathanach before the influence of the commercial and rapidly expanding industrial society of Great Britain assumed significant proportions.

Sources of Information

There is an almost complete dearth of information about 127
the internal conditions in the Hebrides before the eighteenth century, except for stray accounts of intrigues and rebellions against the Scottish Crown. A combination of causes is responsible. First is the relative lateness of the introduction 127
175*
of writing. Second, there is the fact that the Western Isles 212
were held by the Norse from the ninth to the thirteenth century. Third is the destruction of Scottish records. The ecclesiastical

tenure in vassalage.[12] By the time Skye was placed under the 175*
suzerainty of Scotland, the old tribal organization had completely disappeared, and the nation was being governed by a hierarchy which imitated English use. There was, however, an important difference between the feudalism of Scotland and England. Although the landed aristocracy was Anglo-Norman, the Normans had not conquered Scotland. They were unable to work out the refinements of feudalism, especially the manorial system.[13] There was also an important difference in the form of the two governments. The Scottish king granted his charters and ruled with the advice of his bishops, earls, and barons, leaving the Parliament almost devoid of power, while in England Parliamentary government had been firmly established when the two nations were placed under a common monarch. Nor had the Scottish Parliament become any more important when it was united with the English body in 1707.[14]

It is against the background of this varied history 121
175*
that the local culture must be viewed. We may expect to find features which are traceable to the old Celtic tribal organization, Norse influence, and Scottish feudalism. English 175*
186
influence would have appeared too late to be counted as a factor in the moulding of the culture, and the adamant dislike of the Highlanders for the English, evidenced by their successive rebellions and their persistent efforts to support

CHAPTER IV

SPANNING TWO CENTURIES

The first problem faced by the anthropologist who attempts 121 to seek cultural continuity through periods of population change in a culture and society contained within Western European civilization is the formulation of an interpretative framework which will reduce the complexity of national and international history to the level of the local culture. The problem is made doubly difficult by the almost complete lack of unbiased opinion. The accounts of the Isle of Skye which 114 have been preserved were written by men who had witnessed and had been impressed by the apparent benefits of expanding imperial commercialism and the prosperity of the beginnings of the Industrial Revolution. The writers were pedants, self-styled political economists, and trained agricultural economists. Few of them ever descended from their platform of economic criticism, mainly directed at the proprietors and the principal tenants, to describe the non-economic aspects of the way of life of the people, unless some novelty caught their attention. Those who wrote about the religious facets of the culture were no less opinionated than the economists. The occasional author who devoted attention to the Island's society was more concerned with the personalities of notable individuals and their achievements, especially the exiles, than with the bulk of the population.

114 It is only in the distant past and comparatively recent times that governmental inquiries and enactments give a glimpse into the culture. For well over a hundred years after the abolition of the clan system the British government showed no inclination to become involved in the local situation. While the American colonists rebelled because taxation without representation was no less than tyranny, the Islanders suffered in silence under the laws of the Kingdom. Two works, however, 127 do give a picture of life on Skye. These are the (Old) Statistical Account of Scotland and the New Statistical Account of Scotland.[1]

121 The conceptual scheme which has been adopted to reduce national history to culture history takes two points of departure.[2] On the one hand, there are four well defined periods marked by innovations in the economic, social, and religious aspects of the culture and varying rates of population change. On the other hand, there are the overall trends of culture 101 and population change and the continuity of the culture. The 175 dates selected to mark the beginning of each period are: 1745, 1811, 1845, and 1886. The year 1745 is the conventional date for the beginning of the modern period of Highland history. It also marks the beginning of a prolonged period of population

[1] The Statistical Account of Scotland, ed. Sir John Sinclair (21 vols.; Edinburgh: William Creech, 1790-1799); and The New Statistical Account of Scotland, Vol. XIV: "Inverness - Ross and Cromarty" (Edinburgh: William Blackwood and Sons, 1845). I shall refer to these works as OSA and NSA.

[2] I am indebted to Julian Steward for the general approach which follows.

in Scotland, it lacked the same effects elsewhere. There is 175 significant correlation in the Highlands and Islands, as in 178 Ireland, of the disproportion of the population to the means 731 of subsistence, due to a change from subsistence farming to a partially commercial system of land use, and the intensity of the crop failure. In both countries the persistence of innumerable 92 traits from the traditional economy, including conservative techniques, attachment to the land, and a tendency to share the land among the kin, hampered commercialization or, at least, specialization and led to devastation.

Five years of famine ended the growth of population. 175 The emigration of large numbers and the death of untold numbers 178 must have seriously disturbed the patterns of interaction 182 within the extended family and the township. Although the 140 proprietors made a final effort to help their tenants, ruining themselves financially, they had foreseaken their people. The 713 ministers were no longer able to contribute to group solidarity, 41 because the symbols and values they upheld reflected the attitudes of the landlords and lacked significance for the people.

A religious revival reached effective proportions by 1754 1812.[42] The appearance of the Revival suggests that the culture 178 was far more disorganized than the scant social and economic 182 record indicates. Normally, the attempt to seek supernatural 120 assistance as a source of comfort and hope appears only after the culture has become thoroughly disorganized.[43]

175 existing system of proprietorship. At length, land leagues 178 were formed to give body to the peasants' protest. The movement 662 finally reached Scotland in 1880. By 1883 it had become important on Skye. Significantly, the agents responsible for the Skyemen's 71 agitation were Irishmen.[71] The stimulus for accepting the course of action advocated by these agents was provided by another famine which coincided with the loss of wages from employment on the east coast fishing vessels.[72] The crofters took the law into their own hands. The Kilmuir crofters refused to pay their rent. The Glendale crofters forcibly drove the sheep off their old cattle grazings. Glasgow police and the Royal Marines were dispatched to Skye.[73] Out of this unrest came the appointment of a royal commission of investigation, 72 but their work is our subject for the fourth period. A more pressing problem is what effect did these events have on the religious outlook of the crofter and what influence did religion have on the configuration of the culture.

175 While the Revival was underway during the first half 178 of the century, the General Assembly of the Church of Scotland 745 was witnessing a renewed battle over the old question of patronage, the right of the proprietor to select the kirk's minister. Finally, in 1843, the Church was broken by schism

[73] Detailed accounts of the land raids and resistance to the police can be found in Alexander MacKenzie, The Isle of Skye in 1882-1883 (Inverness: A. and J. MacKenzie, 1904, pp. 7-144. See also Cummings, op. cit., pp. 146-147 and William MacKenzie, op. cit., pp. 24-25.

CHAPTER VI

THE ISLANDERS' SOCIETY

The Units of Social Organization

Since the Sgiathanach has consistently been more bound 421 630 to his locality groups than the relatively mobile members 571 of the main stream of Western Society, I think that we shall 127 128 find a pause to review the character of the social systems which are primarily based on territoriality a valuable aid to our understanding of how cultural continuity has been preserved. By now we are all well aware of the fact that the township is the efficient economic unit. It is also a social entity. The members of each township display a consciousness of common interest, symbolized by the communal hill grazing; and their inter-personal relationships, reflecting ties of kinship and friendship, reveal a rate of interaction second only to those of the crofting family. In most of the townships, the people are related and re-related on both sides 361 by descent and marriage. Laid out along the coast or in a fertile glen, with the cottages on the individual crofts, it has a discernible form. The township is a small cluster of five to twenty homes; approximately an equal number of garden-like farms, stretching out behind the houses; and,

121 One further word of caution is in order before we proceed. It will soon become obvious to the reader that my main interest in the social organization of the Sgiathanach is a concern with status. In the final analysis, I have decided that this is the only fruitful means to seek cultural continuity despite population change. Therefore, I have glossed over many details of the social organization, and I have described others only in so far as they throw light on the ascription and achievement of status. With this in mind, let us turn to a consideration of the Islanders' society.

Kith and Kin within the Township and on the Croft

The society of the Sgiathanach is no different from any 55 other society in the world in ordering interpersonal relationships by attaching cultural significance to the physical factors of kinship, age, and sex. As Linton has asserted, kinship establishes the individual's relation with his cultural recognized relatives; age and sex establish his relationship with the total society and the section of the culture in which he can participate.[10] Skye differs from many societies, especially contemporary American society, by using these factors exclusively in determining the status and role of the members of the township. The status and role of every individual is ascribed.[11] The only way an individual can achieve status is

[10] Ralph Linton, "A Neglected Aspect of Social Organization," American Journal of Sociology, Vol. XLV, No. 6 (December, 1940) pp. 870-886; and "Age and Sex Categories," American Sociological Review, Vol. VII, No. 5 (October, 1942), pp. 589-603.

[11] The theoretical concept, of course, is Linton's (The Study of Man, pp. 113-131).

by leaving, for if he fails to conform to the traditional norms and patterns of behavior, he will be looked upon as an eccentric. This fact has continuity through all periods of Skye's history.

We have already seen how the age and sex structure of the population has changed in response to social and economic conditions and how this change has influenced the ascription of statuses within the crofters' division of labor. Briefly, there has been a contraction of the number of opportunities for ascribing status. This had made it necessary for some men to perform tasks once the exclusive domain of women and for women to participate in activities which formerly were the responsibility of their men folk. Older people must now function in ways which once were the responsibilities of the youth and young adults. These changes, however, have been accompanied by persistencies, in particular a continuity of basic status values. I think this will become clear through a discussion of the family structure. We shall begin with the nuclear family.

The Nuclear Family. Since my interest is in status, I shall adopt the unorthodox procedure of considering the nuclear family in terms of the changing status of the individual members from birth to maturity. This will give us a dynamic picture of family life. At birth the individual's relationships within the crofting family and, to a lesser degree, within the township are established. Like those of his parents, who now have the ascribed statuses of mother and father, his relationships will remain unchanged until he marries and founds

"do something about it." The villager feels that he is the one who is paying for all the services and facilities the government sponsors. There is a growing consensus that he is just a working man who has to get along as best he can while the crofter is coaxed, coddled, cajoled, and pampered with grants, advantageous loans, and subsidies. "Sure there are poor crofters just as there are men who fail in business," said one man, "but if we can't make a go of it, we go down the drain." Another man put it, "The crofter gets paid by the government for doing nothing--for having a cow on the hill--all I get I get by sweat, hard bloody sweat." These feelings are especially common to the newcomers, but they are by no means held exclusively by this group.

The Social Structure of the Trade-Center Village

121 The village of Portree has a complicated social structure. While I can accept Murdock's contention that social classes operate to unite members of different local groups and to segment the community, I cannot accept his view that the presence of social classes complicates the social structure of a community.[26] Class status, as any status, determines the pattern of reciprocal behavior. By placing the individual in a group with expected behavior patterns, the social structure may be simplified. The individual in the group finds security in the cohesion with others who

[26] Murdock, op. cit., p. 88

121 share similar social attitudes and a distinctive way of life.[27] The investigator can understand the society with greater ease once he can equate the differing cultural expressions with the sense of status.

Ascribed status continues to be important in Portree, at least in stratifying the old Skye families. On the fringes of the village there are a few part-time crofters or tradesmen who keep some stock and grow a little grain and few potatoes. These men and their families as well as the crofters from the hinterland find their place in the village society through clique groups, in particular those based upon kinship and "friendship." Several of the county families reside in the village and, with the landed gentry who continue to live on their estates, take an active part in village life.

Between the two poles there is a large intermediate group. Their occupations range from the professions, including doctors, ministers, teachers, and lawyers; through employees of the national and county governments, including estate factors, policemen, office managers, and clerks; to shopkeepers, tradesmen, truck drivers, and laborers. Elsewhere in Great Britain these people would fall into the middle and working classes.[28] On Skye such stratification is unimportant. If we cannot use the British scheme, we certainly cannot employ the American system developed by Warner.[29]

[27] Cf. MacIver, op. cit., pp. 166-167.

[28] Cf. Lewis and Maude, The English Middle Classes.

[29] W. Lloyd Warner and Paul S. Lunt, The Social Life of a Modern Community (New Haven: Yale University Press, 1941); and The Status System of Modern Community (New Haven: Yale University Press, 1941).

121 The inapplicability of Warner's scheme within the United States has been demonstrated by Kroeber,[30] and its use beyond the United States has been censured by Steward.[31] Now, while the British tend to admit more freely to the existence of class than Americans do, the social fluidity of the village has impressed many newcomers who grew up in the Lowlands or England.

If stratification exists,[32] there is general agreement that cleavage or social distance will be found. Murdock, to cite only one authority, has said the cultural differences and social distance commonly present between groups separated spatially are frequently found in socially separated groups.[33] This is certainly true for the landed gentry and the crofters, but in regards to the intermediate population, Portree seems to be very much like Sublette, Kansas.[34] The presence of the

[30] Kroeber, Anthropology, pp. 270-272.

[31] Steward, Area Research, pp. 40-49.

[32] My general approach to the class structure followed that of James West (Plainville, U.S.A. [New York: Columbia University Press, 1945], pp. 110-130); but I also used Warner's objective-reputational technique (W. Lloyd Warner, M. Meeker, and K. Eells, Social Class in America. A Manual of Procedure for the Measurement of Social Status [Chicago: Science Research Associates, 1949]); and I employed the so-called "judges" technique. For a clear presentation of this last approach, see Leonard Broom and Philip Selznick, Sociology (Evanston, Ill.: Row, Peterson and Co., 1955), pp. 172-173.

[33] Murdock, op. cit., pp. 265-266. See also Linton, The Study of Man, and William, The Ways of Man, p. 352.

[34] Earl J. Bell, The Culture of a Contemporary Rural Community: Sublette, Kansas (Rural Life Studies, No. 2; Washington, D.C.: United States Department of Agriculture, 1942), cited by Loomis and Beegle, op. cit., p. 384.

and no one thought himself capable of running a future meeting. At last reports, the wife of another proprietor was having her impression that "It's not as easy as it sounds just to call a public meeting in Glendale," confirmed. While the majority of the crofters thought an Old People's Welfare Committee was a good idea, they had no intention of being instrumental in its organization or in assuming any position which might elevate them above their neighbors. Throughout this chapter, the stress on conformity has been apparent, let us now turn to the problem of social control for a clearer picture of how conformity is enforced and to see how the Sgiathanach handles the deviant.

Social Control

626 Since social control is an important topic, I want to go into a further analysis of the manner in which the group influences the behavior of its members. For the sake of clarity, we must distinguish between social and political

121 control. By social control I mean the informal pressure or spontaneous action which any organized group can muster to exert an influence on its members sufficient to encourage conformity to tradition patterns of behavior. Political control, to me, involves the independent or requested interference of the state, as represented by the police, in any case which involves the enforcement and maintenance of law and order as prescribed by legal enactments. On Skye the laws of the land do not always have the same meaning to the

The religion of the Sgiathanach may also be regarded as the logical outcome of a movement which began two centuries ago when the all inclusive bonds of kinship and affection were replaced with tenets introduced from the wider contractual society. This movement, as we know, bore its first fruits over a hundred years ago. The people themselves turned from the ministers who were supporting symbols and values no longer meaningful to the crofters. They embraced the preachers of a dynamic gospel as a means of consolation in their distress. Thus, the religious pattern derived elsewhere and superimposed on the Sgiathanach has been refined with logic and vigor. It has become the one insurmountable barrier to assimilation with Great Britain. No less than four times religious schism has demonstrated the essential unchangeableness of their religion. The process has been carried on with such dedication and success that it now disturbs the unsympathetic laity and the clergy of the Church of Scotland no less than the resistance of the people to Presbyterianism did in the remote past.

We saw in Chapter IV how an understanding of the religious history of Skye is indispensible for the comprehension of the larger problem, the means by which the culture has maintained continuity. In Chapter V and again in Chapter VI we saw how this continuity has been preserved. We have at last come to the point at which we can ask why has there been continuity. The following analysis is concerned with the sanctions of the Presbyterian ethic, particularly as it affects the social structure, religious behavior, and the roles of the ministers and the religious laity in the

orary scene. Assuming that few of my readers know any 128
out the nature of the religion of the Sgiathanach than 121
hen my wife and I first set foot on Skye, I shall be-
n a brief description of formal organization and
y.

Formal Organization and Theology

he Isle of Skye now has four independent Presbyterian 795
s, the Church of Scotland which is the official state
the Free Church of Scotland, The Free Presbyterian
and the United Free Church. There are, in addition,
atholics, including the one family of the county
who worship by themselves and several government
es in Portree who meet together and hold services
ivate chapel. There is also a fairly large number
copals, consisting exclusively of county families
comers, who periodically receive a visit from a
r in Fort William but who otherwise attend the
s held in the Church of Scotland.
he Presbyterian Churches differ from one another 779
ral fundamental details of their constitution, doctrine, 795
and practice. All claim to be in historic continuity
e Church of Scotland which was reformed in 1560, the
es of which were ratified in 1592 by the Scottish
ent, and the security of which was recognized in the
of 1707. All, except the United Free Church, hold
principle of national recognition of religion,

regation. The Synod and, in the case of the Church of 795
land and the Free Church, the General Assembly do not 794
ally interfere in local administration. They can be called
to enforce the decisions of the Presbytery, but they are
arily deliberative assemblies which meet once a year in
burgh to discuss over-all church policy. Again, as we
seen, attempts of these higher bodies to impose their
on the local kirks have led to schism. Thus, since
fundamental seat of control is vested in the kirk session,
he neighborhood, the interpretations reflected in the
er religious courts do not necessarily find expression
he patterns of religious behavior on Skye. Indeed, the
ch of Scotland on Skye is more like the other sects than
s like its parent body elsewhere in Scotland, where it
gradually moved toward a position similar to the Anglican
ch or the Presbyterian churches of the United States.
he uninvolved observer, the differences are insignificant
pared to the essential similarities of the local churches.

The Role of Religion on Skye

Because of the hold of the ramifications of religion 121
an, in particular, man as a member of a folk, peasant,
predominantly rural community, religion tends to have a
eating influence on all significant phases of life.[4]

---

[4]Cf., e.g., Robert Lowie, Social Organization (New York: Rinehart and Co., 1948), pp. 191-192; T. Lynn Smith, The Sociology of Rural Life (New York: Harper & Bros., 1947), 423; and Kroeber, Anthropology, pp. 282,284.

Functioning in diverse ways, religion reinforces standards of behavior. As a supraso cial and cultural regulator of social life, it sanctions the way of life of a group and its basic social forces.[5] While the great world conscious religions have been influential in redirecting whole civilizations, their success has been largely due to an ability to function in harmony with local cultural conditions. The symbols and values they extend must be meaningful to the people. Failure to protect certain values brought about the rejection of Catholicism and the acceptance of Calvinism in Scotland.[6] Continued sanctification of values no longer meaningful to the Sgiathanach cost the Church of Scotland its hold over the people. The influence of religion, especially once it has ceased to work for change and has become conservative, as all organized religions are wont to do,[7] is expressed in terms of what particular traits it singles out for sanctioning and, conversely, what traits it refuses to sanction or places under taboo. Obviously, this is but a part of the primary function of religion, its role in bolstering group solidarity.[8]

Their deliberative, judicial, and authoritarian functions are identical with those found among the Catholic small farmers of Ireland.[9] Of course, it is by no means unique in human groups for the aged to attempt to maintain their accustomed habits and statuses while the youth endeavor to find acceptance for new ideas.[10] Nor is it unique for the younger members of the society to resent the restraints imposed by the older people to punish deviation from traditional behavior.[11] Culture phases, as Kroeber has pointed out, associated with age tend to correspond to changes taking place within the society, rather than reflect static lines of segregation, such as those which exist between classes.[12] If these assertions are valid, the success which the elderly, as a sodality, enjoy in barring the youth from achieving acceptance of novel patterns should be indicative of the importance of age controls on the Isle of Skye. In order to see how they exercise control and how successful they are, let us consider those events in the life cycle which Van Gennep has called rites of passage.[13]

Rites of Passage

Rites of Passage function in all societies to mark the

passage of the individual from birth, through his age statuses, to death and to re-establish meaningful patterns of interaction after a disturbance by an event in the life cycle. When individual and reciprocal patterns of behavior following birth were described, I pointed out that they were a much modified survival of the old practice of kirking, the custom of having the parents, their "people," and "friends" attend a church service to offer thanks, followed by a feast and dance. Similar festivities once accompanied baptism. As the first event in the life cycle which concerns the church, and as one of the two sacraments celebrated in the church, baptism is of supreme importance. In addition to revealing the amount of control the elderly have over the group, it shows how the status and role of the father has been maintained.

The child's father, as the religiously sanctioned head of the family, approaches the elder for his township and requests the administration of the sacrament. The elder, in turn, intimates the father's request to the minister, who then calls a kirk session. At the kirk session the father is examined. He must live an exemplary life, in the way of the church, including regular sabbath church attendance, daily worship in the home, and the renunciation of all forms of frivolous amusement. The elders, of course, know how he habitually behaves by observation and reputation. In Glendale, if not in Kilmuir, the minister knows as well, for, as one woman said, "You never know what your neighbors will run and tell the minister." Sudden reform is not good enough. The father must also demonstrate his ability to raise the child

glens a family, newcomers to Skye, prevailed on the local school teacher to hold a Sabbath school for the children. The local missionary objected. If they were going to have Sabbath school, it should be in Gaelic. His prestige and control over the population secured his position. The children of the people who originated and organized the program were excluded because they did not "have the Gaelic."

Another problem which is beginning to stem from the use of Gaelic as the language of religion is the difficulty of securing a minister. Traditionally, it was an ideal to send a son to study for the ministry. This ideal remains, but in the last few years only one young man from Skye has shown a desire to become a minister. Indeed, the majority of ministers on Skye are not Skyemen. I believe the only minister who serves his own neighborhood, the neighborhood in which he was born and raised, is the Free Presbyterian minister in Glendale. It is becoming more and more difficult to fill charges as they go vacant. Each year several Highland charges are changed from "Gaelic essential" to "Gaelic preferred." If we go beyond the role of religion as it orders human relationships, through its more formal aspects, and consider the influence of religion on the secular behavior of the Sgiathanach, we can come closer to an understanding of why the youth are slowly turning away. At the same time we shall be able to round out our picture of the expression given to the Presbyterian ethic on Skye.

control of the "elect" crofters. They, are the "elect," and their status is independent of the control of the venerable old men.

Summary

Whereas the culture of the Sgiathanach was oriented around the clan system in the remote past and was intelligible only by an awareness of the all-pervasive influence of the clan, today congregational religion provides the focus for the culture. If we are to understand the Sgiathanach we must fathom his religion, that is, the interpretation which he has given to Calvinism. Moreover, this highly integrated and systematized aspect of his culture has provided the means for preserving cultural continuity. Economics and social organization aid us in recognizing how cultural continuity has been maintained. Religion puts at our finger tips the how and the WHY.

The basic status values have held good because religion has sanctioned them. The old men of the neighborhood have been successful in sustaining their statuses and habits through their position in the esoteric religious hierarchy. By holding the father responsible for the spiritual welfare of his family, and judging a man's spiritual enlightenment on his renunciation of mundane pleasures as well as his knowledge of religious tenets, the elders exercise judicial and authoritarian functions. At the same time, the status of the father within the family is strengthened. After a

CHAPTER VIII

SUMMARY AND CONCLUSIONS

My intention in writing this present study has been to inquire whether or not marked population growth and decline is a criterion of cultural discontinuity. To this end we have spanned more than two centuries of the culture history of the Isle of Skye. As we proceeded from a description of the configuration of the culture as it was in the days of the clan, to a narration of the perpetuations and modifications of the content of the culture during four periods of the modern epoch, and finally to an account of the contemporary culture, we have been constantly aware of the swing of the population pendulum. Throughout this study I have attempted to analyze the available facts for evidence which would indicate not only cultural but also social disintegration. In this final chapter I shall draw the sundry threads of my running commentary together to support the aforesaid conclusion that population change is not a criterion of cultural discontinuity.

The Population Cycle

In as much as my purpose is to evaluate cultural continuity within the framework of population change, let me first briefly review the changing size and structure of the population.

On the one hand, they stimulated emigration, because the only means of achieving upward mobility was through outward mobility. On the other hand they deterred a complete abandonment of a way of life which offered so few material rewards. This brings us face to face with the problem of cultural continuity.

Cultural Continuity on the Isle of Skye
A Restatement of Theoretical Considerations

In the opening chapter, I presented a series of theoretical assumptions on which I have based my analysis of the evidence for cultural continuity on the Isle of Skye. A review of my presuppositions and my approach to the problem may expedite my final quest for proof that marked population change is not a criterion of cultural discontinuity.

If society and culture are separate though complimentary concepts, cultural and social integration must be independent variables. They tend to find mutual expression, but they are not necessarily found together. Nor can they be measured by the same criteria. Cultures are considered integrated to the extent that their traits, complexes, patterns, and aspects are meaningful to the people. The content of all cultures is continually modified by the disappearance of once characteristic trait complexes and the addition of new ones. Old ways of doing things lose meaning and are disregarded; innovations find acceptance and are given meaning within the configuration of the culture. The form of the culture, its essential distinctiveness, persists. The carriers of a culture, or the

members of a society, become more or less numerous. Their integration is measured by their interaction, their degree of contact, and their ability to exercise social control over the members of the group. In short, social integration depends on the strength of the network of relations which binds the group together into an organized whole.

Cultures have been studied in an organization-disorganization framework,[1] and they have been appraised in an organization-readaptation framework.[2] The reported presence or absence of cultural disorganization, a disturbance of the systematic structure, has depended on the theoretical position of the investigator. Although both approaches require a consideration of cultural stability and continuity, the conclusions reached have depended upon whether or not the social scientist is willing to look for higher levels of organization instead of using only the perspective of the culture as it supposedly existed in the past. Single, isolated, kinship oriented cultures need not disappear when brought into contact with complex, contractual cultures. They can find a readaptation. But if they fail to maintain a genuine degree of continuity, by placing a value on their heritage, they disintegrate, the basic pattern becomes fragmented, and they disappear.

Finally, the concept of anomie can be employed to evaluate social disorganization, and I believe that an absence

[1] Redfield, The Folk Culture of Yucatan.

[2] Lewis, Life in a Mexican Village; and Steward, Area Research, pp. 126-149.

of anomie is an additional support for my position. With these theoretical assumptions in mind, we are prepared for a final interpenetration of the culture of the Sràthanagh.

Evidence for Cultural Continuity

If I were to view the Isle of Skye from the single perspective of the culture as it functioned two hundred years ago, in an organization-disorganization framework, I might logically argue that there is evidence for cultural disorganization. The clan system, which had pervaded all aspects of the culture, was rendered inoperative by the intolerance of the British government and the cupidity of the patriarchs. Land tenure was divorced from considerations of reciprocal dependence and real or fictitious kinship. The contractual principles of the wider commercial society, in which the landlords found a more satisfactory status, were introduced. In time, the customary rights of the tacksmen, who had supported the structure of the clan, and the former clansmen were questioned and repudiated. The older folktales, songs, and many of the superstitions were obliterated. The traditional religious and secular festivities associated with events in the life cycle were abandoned or allowed to survive in a much modified form. The traditional customs of cooperating and visiting were either altered or disregarded. The list of traits and complexes which were dropped from the content of the culture could be continued. It is, indeed, a long one, and it includes elements from every aspect of the culture. If

group.[6] He has maintained cultural integration and continuity. At the same time his conservative religion has not gone quite as far as the Amish Order.[7] The Sràthanagh has rejected only those patterns which would disturb the equilibrium of life in the neighborhood. The penalty for his failure to completely adjust is depopulation; others, like the people of Yap and the Aleuts, are paying a similar penalty.[8]

Further Evidence for Cultural Continuity

Various approaches to the problem of cultural continuity can be attempted in addition to the historical approach which has formed the point of departure for my study. The most obvious would be a comparative study of two basically similar people, the Welsh and the Irish. In the chapter entitled "The Setting" and throughout this study I have called attention to the similarities between the Skyeman, the Welshman,[9] and the Irishman.[10] In a host of cultural features the three are strikingly identical. Some of these common patterns may be remembered, for instance, the clan nature of nucleated villages, the strong patrilineal emphasis, the importance of the old man, and a pastoral

[9] Rees, Life in a Welsh Countryside.

[10] Arensberg, The Irish Countryman; and Arensberg and Kimball, Family and Community in Ireland.

agricultural economy. Some may share my feeling that a further exploration of these similarities would reveal evidence indicative of cultural continuity. We have three peoples who have had ample opportunity for divergence and yet have retained many essentials of Celtic culture. Moreover, all have been losing population since the middle of the last century. Unfortunately, at the present time, I am not prepared to extend this comparative approach. I am deterred by a recognition of two facts.[11] First there is the difficulty that peasant peoples all over the world seem very similar despite their distinctive cultural and historical backgrounds. There is, of course, diversity within similarity. Second there is the truism that the higher socio-cultural level of which the peasant is a part influences the form peasant life may take.[12] Although Anglo-Saxon and Norman influence impinged on the Welsh several centuries before it seriously threatened the Irish and Skyemen, the three groups have been subjected to basically similar stimuli for several hundred years.

Another question which may be asked is, has the culture continued to provide meaningful patterns of interaction for the Sràthanagh? One means of answering this question is provided by Durkheim's theory of anomie. According to Durkheim,

[11] Cf., e.g., Oscar Lewis, "Peasant Culture in India and Mexico: A Comparative Analysis," Village India, ed. McKim Marriott ("Memoirs of the American Anthropological Association," Memoir No. 83, 1955), pp. 145-146.

[12] Cf., e.g., Wagley and Harris, "A Typology of Latin American Subcultures," American Anthropologist, LVII, No. 3, pp. 431-443.

a disorganized society has the following characteristics: a deterioration of the traditional patterns of interaction within the group, a low degree of social contact among the members of the group, and a loss of social control by the group over the individual members.[13] As a result, the individual is faced with a situation in which the norms of behavior and the sanctions for them become less common and clear. To restate my position, although cultural and social integration are independent variables, the absence of this condition of normlessness is evidence that the cultural disruptions of the past have, in each case, been followed by a reintegration within the culture, as well as within the society. In other words, if the norms and sanctions are common and clear and are those of a single tradition, the absence of anomie means the individuals, as an organized aggregate bound together by a network of relationships and a sense of belongingness, are fully enculturated. Moreover, it means the culture, the socially transmitted attitudes, behavior patterns, and techniques which are distributed among the members of the society in accordance with their status positions and sub-group memberships, has maintained continuity. In order to investigate the question of anomie, let us compare my evidence from Skye with the findings of several social scientists who have worked with this concept.

Homans has used Durkheim's theory to analyze a small New Hampshire hill farming community.[14] Hillsdon, like its

[13] Durkheim, Le Suicide, pp. 272-282.

[14] Homans, The Human Group, pp. 336-367.

intain their position by intermarriage, by educating their 182
ildren in England, and by interacting with people of similar 571
atus within the community and beyond. 554 565

The crofters continue to stand at the opposite pole. They
ldom achieve status within their neighborhood. Upward mobility
possible only through outward mobility. Leadership fails
find expression among them in the township or the neighbor-
od. The rare exception is the crofter's son who becomes a [795]
inister and returns to lead his people spiritually. When the [794]
rofters must select a leader, from their own number, the
tatus is accorded to an elder of the church. The elder [794]
already has high status because of his advanced age and his
osition in the kirk. As I have said, the continued operation
f primitive democracy means a minimum of authority and a
aximum of equality.

The intermediate group in the social hierarchy cannot be 182
rofitably used in this discussion. They are primarily newcomers, 554 565
eople from the Lowlands or England, who have joined with the 167
elatively few Skyemen who have left the croft. Sufficient time
as not elapsed for a class oriented structure to emerge. Then,
oo, they are not a numerous group. Still, status is important
n the village. As in the crofting neighborhood, ministers,
octors, and teachers achieve high status through their occupation.
or the remainder of the population of Portree, status depends
ore on personal qualities and outside activities, especially
n the kirk, than on the way one may make his living.

While we are on the topic of status and ranking, let us 121 554

see what Linton, the most explicit exponent of the concept of 121 554
status and role, has to say about societies which are faced with
changing conditions and disorganization.[15] Linton believes that
such societies attempt to develop new social patterns by allowing
individual initiative, thought, and competition free rein. They
are characterized by a wealth of achievable statuses. With
adjustment, ascribed statuses again become common. The con- 554 626
clusion seems inescapable that Skye has adjusted. Perhaps a
few additional illustrations will make my point clearer. The
crofter who assumes a role of leadership is regarded as an
eccentric, someone to poke fun at no less than the village
idiot. The crofters' children who find their status too con- 554 626
fining must leave the island to achieve status. Some succeed, 167
to a limited degree, by moving to Portree, but they are never
free of suspicion. Since the majority of achieved statuses
on Skye are left to newcomers, it might be said that the
Sgiathanach has selected place of birth as a means to ascribe
status. Not infrequently the newcomer's acceptance is followed
by his being placed in roles of responsibility in both formal
organizations and informal groups. The reader may remember
the case of the young man from the East Coast who found himself
on no less than eleven committees. In Kilmuir the people are
represented on the County Council by a minister and the Crofters'
Club is run by the school teacher.

I believe that the most important feature of the concept 626
of anomie is the loss of social control which is said to follow 182

[15] Linton, The Study of Man, pp. 113-131.

Whatever signs there were of social or cultural dis- 175
organization, or threatened disintegration, in the nineteenth 178
century they have disappeared. Steward's theory that folk 182
societies do not entirely disappear but are rather modified 771
by way of a readaptation to the higher level of socio-cultural 786
organization of which they become a part is borne out by the 121
evidence from the Isle of Skye.[17] At the same time, on the
basis of events in the culture history of the Sgiathanach,
I would qualify his theory by introducing a new condition.
Isolated, relatively simple, kinship oriented societies and
cultures which must achieve a reintegration if they are to
preserve their continuity readapt, not only to the higher
socio-cultural level, but also to the older way of life.

In conclusion, I regard Skye as a community which has 178
maintained a continuity of culture despite marked population 182
change. The continued distinctiveness has been made possible [161] [571]
by a reintegration of the culture and a restoration of the
network of relationships which make for harmonious living
together. As in any socio-cultural group which has passed
through periods of threatened disintegration, the joints of
repair may be weak. Conflicts are tending to appear. The
crofter, who has refused to fully adapt to commercialism,
is seasonally faced with a variety and succession of tasks
which no agriculturalist in the wider society would tolerate.
There is the desire of the youth, who are too few in numbers
to form a sodality, for a share in the mundane pleasures of

[17] Steward, Area Research, p. 111; see also Wagley and Harris, op. cit., p. 441.

will have made his final retreat from one of his last outposts. 181 The belief of an old minister in Glasgow, a Sgiathanach who serves his fellow exiles, that "the Gael wants out" will be confirmed.

We have now finished our exploration of the thesis 121 that marked population change is not a criterion for cultural discontinuity. If my arguments have not been convincing, I shall feel very much like another minister who served the Sgiathanach as best he could. When his worn and torn Bible fell from the pulpit during his sermon one Sabbath many years ago, he looked down at his congregation and said, "I have spent myself and my Bible on you, and you are still not converted."

122

122 PRACTICAL PREPARATIONS--source of financial support; selection and assembly of equipment; arranging problems of transportation and bureaucratic red tape; familiarization with previous descriptive literature; learning language, etc.

FOREWORD

122 The research on which this thesis is based was made possible by a grant from the Foreign Area Fellowship 114 Program. Research was conducted from June, 1970, until October, 1971.

000 Among the many individuals and organizations that were extremely helpful, I would like especially to thank Miss Dorothy Soderlund and Mr. James Gould of the Foreign Area Fellowship Program; Mr. Eric Cregeen and Miss Morag MacLeod of the School of Scottish Studies in Edinburgh; Mr. Roger Bland of the Scottish Land Court; Mr. Gordon Adams and Mr. Alastair Munro of the Highlands and Islands Development Board; Mr. Halley of the Crofters Commission; Mr. D.J. Mackay and Mr. John Murdo Morrison of An Comunn Gaidhealach; and Mr. Patrick Guiton, Mr. Finlay Macleod, Mr. Norman MacDonald, Miss Susanne Barding, Mr. Charles Macleod, Miss Pat Swannie, Mr. W. Mathieson, Mr. Alastair Fraser, Mr. Gordon Gair, and Mr. Alec Murdo Morrison.

Special thanks are due to Mr. Robert Storey, that summum bonum of pivotal nodes in a vast network of contacts, and to his wife, Lisa.

I would also like to thank my teachers and advisors at Rice University, Professors Edward Norbeck, F.C. Gamst, M.E. Sheldon, Ronald Provencher, and the late Mary Ellen Goodman.

of individuals to organize each committee, no one was willing to accept the post without persuasion. In every case where there was a resident of the county people in the general vicinity, the man or his wife was chosen. The remaining chairs went to newcomers, especially doctors and teachers or their wives, mainly by default. They were not present. No one on Skye ever overtly seeks a role of responsibility. For the central committee, it was suggested, by a newcomer, that there should be at least two Skye people over sixty to get the point of view of the people who were to be helped. When the committee was finally formed, there was not one native Skye person on it. The chairman was the wife of a local landlord; the four members were another proprietor's wife, a Lowland woman, the minister, and an Austrian woman.

At no time was a vote taken. The person who can be persuaded to accept office is always unanimously "elected." On another occasion someone had made the mistake of nominating two women to fill one post. Rather than put the matter to a vote, the people present "elected" me, as a disinterested participant, to select the woman who would serve.

By the time I left the Misty Isle only one of the local committees had taken a step in the direction of organizing itself. A meeting was called in Waternish where either a returned exile or the minister was to preside. Neither of them would step forward. Again the task fell to one of the county people. She drove up from Portree to take the chair and help the people elect the members of their committee. Her journey was fruitless. Hardly anyone attended the meeting,

124 INTERVIEWING--methods of selecting informants or subjects (e.g., sampling); use and selection of interpreters; methods of checking and rewarding informants and interpreters; group interviewing; methods of interviewing (e.g., question and answer, nondirective, use of topical outlines); special techniques (e.g., life history, genealogical, event centered); use of documents prepared by informants; etc. See also:

informants 115

yard and occasionally a barley-kiln in which to dry grain before malting it for home-brewed beer. A 'black mill', with its primitive horizontal water-wheel, stands apart by some burnside.

Round the circular hearth, a large company can assemble in very social fashion for talk, story and song, the meeting *together* (*ceilidh*). By the transfer of the hearth from the centre and the substitution of a gable fireplace and regular chimney, the social circle is halved, while meantime the tales of the *ceilidh* are forbidden or forgotten. Happily the bench still stands against the wall, near to the open door, through which neighbours slip in with a word of greeting to find a customary welcome.

The dwellings on the summer pastures out on the moors show great variety, illustrated in Fig. 10(B). A simple type in use is built of turf and stones, lightly roofed with turf placed on spars. A more primitive 'beehive' type (which fell out of use before 1900) was stone-built and corbelled, probably for lack of timber. And whereas the lighter type always stands by itself, the corbelled type was added to until a dozen cells formed a single mass, suggestive of ancient 'neolithic' hamlets as at Skara Brae in Orkney, described by Childe, and of the domed, corbelled huts of the ancient East.

A further type was the 'spring house' of Tolsta, NE. Lewis, in which both cattle and folk sheltered in spring a little way from the village, before going out to the more distant moor. Mr. Donald Macdonald, F.R.S.G.S., a native of Tolsta, informs me that the spring house was in use until 1936. He remembers vividly how life in the shieling restored health and colour after the winter.

423 In May 1918 Lewis was bought by Lever of Port
565 Sunlight, then Baron Leverhulme of Bolton-le-Moors (his birthplace), the head of a great combine with 50,000 white
157 and 25,000 black employees. Meeting him in Lews Castle in August 1919, Dr. Hardy and I found him troubled
• 124 by a human situation he had failed to diagnose. Short and stocky but very erect, quick-eyed and rapid of manner, and with a wide expressive mouth, he spoke earnestly of his plans; but his eyes flashed and his mouth set, as he rapped out, "They keep putting off, yet they leave the people in houses *not fit for Kaffirs*!" The question, "What objective inspired—or misled—Leverhulme to buy the Island?" is answered by his son and biographer.[1]

159 By 1917 Leverhulme had felt it was time to devolve
423 his personal authority over his business, in the interests of its future. Hence he looked about him for an estate
433 in which he could exercise "his passion for changing the face of nature", and his eagerness for 'planning' with drawing board and T-square, and for philanthropy.[2] He nearly bought an estate in the Midlands in order to develop it; but work had already begun there, and he wished to find a place which would be his to remodel from the start. Thirty years before, Leverhulme had visited Lewis and now in 1917 he spent a week there, motoring all over the Island. "He was enraptured . . . he saw not merely a countryside in need of more and better roads, not only a residence and grounds capable of alteration and improvement, but a problem to be solved, a human and racial problem which had so far baffled all who had tried to solve it. . . . He had been told the Lewis man was lazy,

[13] [1] Leverhulme (and Viscount), *Leverhulme: By His Son*, 1927, chap. xxvi, p. 221 ff. Lord Leverhulme, who had thought of styling himself 'Of the Isles' took the title 'Of the Lews'.

[2] Leverhulme (1927), cf. pp. 81-86.

182 estate, or where a single lodge was bought as a home for
161 retirement, depopulation might not matter. Certain popu-
471 lated parishes, however, were bought as investments by men of comparatively modest means. The principal
471 reasons for his purchase given to me by a retired man,
• 124 formerly connected with the administration of the Lews estate, were two. Asked if he had found, and expected, steady, remunerative payment of rent, he replied: "Certainly!" Next, in view of Press forecasts of general emigration, I referred to the fact that if large numbers of crofters decided to give a year's legal notice of departure and apply for compensation for improvements, including the erection of a 'white house' (otherwise than by Government aid), the landowner would be faced by heavy liabilities while deprived of income. Had the purchaser no fear of such an eventuality? "Certainly not!" was the reply, "the crofters will stick to their homes for many a long year."

829 These examples show that, while the defeat, or non-
458 realisation of Leverhulme's schemes, seemed to many outsiders the beginning of a not distant 'end' to the Island community, the Islanders themselves did not contemplate a final exodus. They were quite uncertain what was to come, it is true. Who was not, in those years of discouragement for Scotland and her people, for Wales, for Tyneside and Lancashire? The years of Leverhulme's departure from Lewis and of his death brought bad seasons. In 1924 storms destroyed crops and the peat would not dry. Herring catches and prices, though they had risen a little since 1921–22, had not allowed recovery from the losses sustained. The cessation of Leverhulme's wage-payments meant a gap in income which the Islanders could not fill
[135] at home. To relieve poverty in 1924–25, a Highlands and

127 one thing, an attempt is being made to build up the value of
241 the sheep and cattle stock. Then too it is hard to obtain
231 information on personal income. Not a few Highlanders are
434 reluctant to share in the cost of maintaining the government
• 124 and, consequently, equally reluctant to discuss their income.
[825] Still, it does give some indication of the potential income for 80 percent of the Skye crofters. It should not be forgotten that a large proportion of the small crofters will have absolutely no income from the land.

The Income of a Medium Croft. The medium croft, according to experts, has a potential income of £150 to £200 a year. Like the small croft, it provides a home, potatoes, vegetables, milk, eggs, meat, and peat. The budgets for one croft of this classification for 1952 and 1953 show a cash income of £203 17s 2d. and £170 15s. 11d., and a net profit of £169 12s. 1d. and £96- 11d. The marked fall in net profit is accounted for by a decrease in the acreage under oats, increased expenses, and the sale of fewer and younger stock, which also affected the cash income. The total hours devoted to crofting are estimated at 600 to 800 hours.

This croft supports a family, a married couple and their children, supplemented by seasonal auxiliary employment on the part of the father. As presently worked and stocked, it could not be left to a woman with any expectation of the same return. The stocking is two cows and followers and fifty sheep. There are 16½ acres of cultivated land, all but a quarter under grass.

1953 it was only £313 2s.1d. This marked fall was due to the 127
loss of sixty-nine sheep and one head of cattle, the effects 241
of which would not be felt until the following year. 231
434

This croft is inhabited by a married couple, and the husband's father and younger brother. It requires the full attention of both brothers and, occasionally, hired labor, in particular in the spring when the sheep demand a great deal of attention. The income in 1953, it may be added, was considerably more than most Scottish tradesmen and not far below that of a university lecturer. The stock averages between five and ten cows with followers, ten head of beef cattle during the summer, and 400 sheep. The cultivated acreage is fourteen acres, usually half of which is under hay and grass. I regard the large croft in my sample as typical, but it is typical of less than 1 percent of all Skye crofters.

The Income of a Farm. For comparative purposes, I should like to briefly consider the cash income of one farming subject. The budget I obtained is far from typical. With twenty-one farms each with its own peculiar advantages and each farmed under differing technological conditions, I doubt that a representative type could be singled out. Moreover, the [124
only way I could obtain a farmer's budget was to secure it surreptitiously; therefore, I do not know the details of stocking or the number who derive their support from the farm. We may be certain that it is one of the larger sheep farms. Despite an expense for hired labor of over £1000 each year,

4: Moisley et al. K-5 (1959) 1962 ES10 Highland Scots ES10
Uig

their houses and allowed us to completely disorganise them with our mountainous heaps of maps, files and notebooks, and particularly to the housewives whose excellent meals were never out-paced by our enormous appetites. Finally, although in general it is invidious to mention names when we received so much help from so many, four gentlemen whose assistance was quite exceptional deserve special thanks - Donald John Macleod, Breasclete; John Macdonald, Meavaig; Donald Maclean, The Schoolhouse, Valtos; and 'Murdanny' Macdonald, Breaclete, Bernera.

The supervision of field work by nineteen persons whose training and previous experience varied very widely was no easy task. I am happy to record my thanks to those members who undertook special responsibilities in this respect; in particular to Philip Wheeler who took complete charge of the Bernera district, and to Brian Loughbrough who exercised supervision of the East Loch Roag - Loch Carloway district. Every effort was made to ensure that our record was complete and accurate; nevertheless we cannot claim perfection. In some townships, despite cross-checking of maps against croft records, serious discrepancies were subsequently found in the cropping data; in others the stock (of sheep in particular) obtained by adding individual croft records is short of the total which were led to expect in the township as a whole. As far as possible such discrepancies have been accounted for, and we believe and hope that our data and conclusions will be of some assistance to those whose duty it is to ensure the economic and social well-being of these crofting communities.

This report consists of four parts:

Part I: Introductory (on crofts and crofters)

Part II: District accounts of South Uig

Part III: District accounts of Bernera, East Loch Roag and Carloway

Part IV: Analysis of agriculture and population data, and conclusions.

Parts I and II form the first volume; parts III and IV will form the second. The actual preparation and printing has been greatly aided by the advice and patient assistance of Mr. G. P. Richardson, Assistant Secretary of the Court, and of his staff in the printing department of Glasgow University.

H. A. Moisley.

5: Caird et al. K-5 (1958) 1958 Park

INTRODUCTION

Since 1955, staff and students of the Geography Department, Glasgow University, have been engaged in a survey of Crofting Districts. This survey is intended neither to rival nor to replace the work of Collier and Fraser Darling, but to supplement their studies by more detailed field work: in the areas selected every croft is visited; so far, including Park, 2,250 crofts have been recorded.

After the publication in 1957, by The Scotsman, of two articles on South Uist by Mr. H. A. Moisley, the Pairc Association inquired whether a similar survey could be carried out in their area of Lewis. Initial arrangements were made by Mr. Moisley, with the co-operation of Mr. MacMillan, secretary of the Pairc Association, and eleven members of the Geographical Field Group spent almost three weeks of their summer holidays working in Park, led by Dr. J. B. Caird, assisted by Miss Catherine B. Smith. The party worked in small groups, each making a particular study of one or two townships. Neither croft nor township boundaries are recorded on any published maps; these were obtained so that land use and house sites could be plotted on 1:2500 plans; details of crops and stock were recorded for every croft and an enumeration of population made for each household, the latter being done by Dr. Caird as a rule, with the help of local residents. Only in this way can a true picture of contemporary crofting be obtained, for official sources, such as the Census and annual Agricultural Statistics, deal mainly with counties, only occasionally with parishes, and never with townships. Yet it is the township groups which are the essence of Crofting.

The people of Park showed great kindness in answering innumerable questions with truth and good humour. Their hospitality was quite overwhelming; without their willing co-operation this study could never have achieved any degree of completeness. It would be invidious to mention any single member; all did their utmost to help, but without Mr. MacMillan nothing would have been possible. It was he who found accommodation for the party in a community where tourist accommodation is almost unknown, and for this, and for much other help, we owe him a great debt. To our hostesses, Mrs. Campbell, 13 Gravir, Mrs. Macaskill, Heatherview, and Mrs. Macaskill, 13 Glengravir, we are perhaps in the greatest debt: they looked after us so very well and unsparingly, and from them we learned the values and outlook of the Park community. By way of preparation, much help was given by Mr. D. M. Mackinnon, the estate factor, by Mr. Donald Mackay, 11A Kershadir, by the staffs of Messrs. David Macbrayne, of the office of the Registrar-General for Scotland, of Register House, of the Department of Health for Scotland and, in particular, of the Department of Agriculture for Scotland. Finally, thanks are due to Miss Bridget M. Gordon, B.A., B.Litt., for the appendix on place names, and to the practical agriculturalist who made an assessment of the agricultural economy possible.

The township reports were prepared by the individual members and the editor contributed the general chapters. The editor would like to record here his personal thanks to the party. Few leaders can have been blessed with such cheerful enthusiasm, steady application and willingness to work long hours; they mastered the methods and techniques of the survey extremely quickly and added new ones. The quality of their field work may be judged from their reports. The checking, organising and filing of the data both in the field and afterwards, as well as the preparation of the tables for the present report, could not have been done without the skill and enthusiasm of Miss Smith. Thanks are also due to Mrs. Esme Diamond and Miss Smith for typing the draft and especially to Mr. I. A. G. Kinniburgh, Cartographer in Glasgow University Geography Department for re-drawing the maps and diagrams.

The value of the field work lies not only in the present report, but also in this permanent statistical and cartographic record in Glasgow, to which we hope present and future research workers will be able to refer.

[Garyvard] [Caversta]

532 At the moment Garyvard appears to be a go-ahead village, carrying out communal schemes
[162] which will benefit the township as a whole. However, the age structure of the population is abnormal since 60 per cent of the population is over 45 years. The future in Garyvard offers young people
192 hard work, little money and no entertainment, making the attractions of the cities and industries of the mainland quite irresistible. Unless some industry can be started the future bodes ill for the area, since most crofters are of the opinion that a weekly wage packet would more than compensate
181 the loss of their independence. Perhaps it is symptomatic of the age of National Assistance and subsidies that man cares more for momentary rewards and the luxuries of life. This is well understood by parents who encourage their children to leave the islands to seek employment either in Britain or within the Commonwealth. The Lewisman is no sentimentalist clinging to dying traditions and a way of life. His present desires have been re-cast as a result of his increasing contact with the world beyond the Hebrides and he is prepared to abandon his home where it defeats his aims and purpose. Unless prosperity can be brought in by way of industry, tourism or increased croft efficiency, possibly through co-operation in working and marketing, it is possible that we are witnessing the end of a community.

CAVERSTA

Helen Mackenzie

131 Caversta lies along a southern inlet of Loch Erisort, five miles from the Minch and is partially sheltered from east winds by the Cromore peninsula and Eilean Chaluim Chille.

133 The physical nature of the terrain is irregular, rising steeply from the water's edge to a level
561 of approximately 225 feet. To the west and to the east, the land slopes to the river estuary and it is here that the settlement occurs. Particularly in the north-west, two marked breaks in slope are visible at 75 feet and 100 feet above the loch, which is here bordered by a 25 foot rock face. The resulting platforms are separated by faces of bare rock. The valley of the Caversta River is a noteworthy feature. Below a small loch, the river follows an irregular course though a wide and shallow moraine-strewn depression and a quarter-of-a-mile from its estuary, has cut through some low hills rising about 30 feet above the depression. At this point, its course becomes steeper as it passes through a small gorge, which is probably an overflow channel.

137 Trees are non-existent and the natural vegetation consists of Sphagnum on the peat bogs in the hollows and grasses and sedges on the gentler slopes. The steeper, less waterlogged slopes, often broken by rocky bluffs, have heather cover; bracken growth is kept in check by heavy grazing.
134 Forty-six acres of land have been reclaimed by clearing heather and removing peat to form the
511 crofts, but the soil, which varies in depth from a few inches to a few feet, is very acid.

129 The six legal crofts vary in acreage from 4.75 to 8.5 acres and a squatter has 5.5 acres of
241 enclosed land. The township is in two parts: Torista, with the two smallest crofts, lies at the east-
632 ern extremity, while the other five holdings, also bounded by a dyke, border Tob Caversta, an
[175] inlet of Loch Erisort. The crofts, which run from the shore to the township dyke, were set prior to 1861, originally the township formed part of Crobeg Farm. The legal units are, in fact, operative units except that one of the Torista crofts, now unoccupied, is used for wintering lambs by the absentee's brother, a resident of Caversta.

542 There are no occupied black houses remaining in either Torista or Caversta, as during the past fifty years new dwellings have been erected in dressed stone or corrugated iron, usually with roofs of asbestos slate, tarred felt, or corrugated iron. Several old thatched houses are now used as barns and byres.

887 arduous is difficult to determine. In the winter of 1953, I
241 helped a small crofter thrash oats, a cooperative enterprise
[123] even with a mechanical thrasher, supplied by the Department of Agriculture. The neighbors who came over to lend a hand were two men and three women. The youngest woman would never see fifty again; her seniors were seventy-seven and seventy-eight. The youngest man, who had just been married, was sixty-three; the other seventy-three. These crofters not only showed more endurance than I did, but put me to shame by carrying the sacks of grain from the field to the byre
[162] at the end of the day. Nevertheless, most of those over seventy, about 15 percent of the population, do not make use
887 of the land for more than growing a few potatoes. An old
231 man cannot keep a cow because, as one man said, "You can't
462 have a cow unless you have a woman to milk it." If he is married or lives with a sister, there may be a cow and a couple of sheep. An old woman may have her cow and sheep if she is strong enough. There comes a time, however, when all the old people will only remember the work involved. Still, they will say, "Och, but they were good for all that."

427 Absentee tenants are responsible for depopulation on
241 the one hand and falling production on the other. A reasonable
161 estimate would be 300. Their number could be as high as 400.
[133] Some townships have over 50 percent of the crofters absentee. The only townships which do not have this problem are the few which contain large crofts. On one small estate there are seventy-six crofts, held by seventy-two crofters. Only thirty

Uig

PREFACE

114 This report is the result of a remarkable co-operative enterprise. In August, 1959,
121 a party of 19 members of the Geographical Field Group and Scottish Field Studies Association undertook a survey of crofting in Uig, one of the four parishes of the Isle of Lewis. In less than three weeks more than 700 crofts and other households were visited or recorded in accordance with a scheme devised by my colleague, Dr. Caird, and myself. This scheme has been used by us in other parts of the Hebrides and, therefore, the record of Uig is an integral part of our Outer Hebridean crofting survey, undertaken between
122 1956 and 1961. We are extremely grateful to the nineteen voluntary field-workers who, it is worth recording, travelled from England and stayed in Uig entirely at their own expense in order to help us; they could have spent their holiday more cheaply in Switzerland - an enlightening comment on the fundamental economic disadvantage of the Hebrides.

Scottish Field Studies Association

Miss F. Madge Phillips	Mr. Roger H. Thomas

125 The object of the work was to make an impartial record of the state of crofting as a
122 way of life and as a means of livelihood. The boundaries and land-use of every croft were recorded on 1/2500 plans, enquiries were made as to acreages of crops and grass and numbers of livestock, and the population of each household was recorded, taking account of sex, age and occupation (part or full-time) of each member including those who, perforce, must seek work elsewhere even though their only home is in Uig. The Croft Record form is reproduced opposite.

122 The successful completion of the survey was not only due to the co-operation of the Geographical Field Group and Scottish Field Studies Association. Adequate preparation would not have been possible without the advice and help of officials of the Department of Agriculture, County Council, Scottish Land Court, Crofters Commission, David Macbrayne Ltd, the estate factors and many other bodies. Miss C. B. Smith, Carnegie Research Assistant, undertook much of the tedious preparatory clerical work. In Uig
123 itself we were encouraged and assisted wherever we went. We owe exceptional debts of gratitude to the Ministers, school-masters and township clerks, who welcomed us and made our purpose known throughout the parish, also to the families who took us into

INTRODUCTION

121 Since 1955, staff and students of the Geography Department, Glasgow University, have been
114 engaged in a survey of Crofting Districts. This survey is intended neither to rival nor to replace the work of Collier and Fraser Darling, but to supplement their studies by more detailed field work: in the areas selected every croft is visited: so far, including Park, 2,250 crofts have been recorded.

After the publication in 1957, by The Scotsman, of two articles on South Uist by Mr. H. A. Moisley, the Pairc Association inquired whether a similar survey could be carried out in their area of Lewis. Initial arrangements were made by Mr. Moisley, with the co-operation of Mr. MacMillan, secretary of the Pairc Association, and eleven members of the Geographical Field Group spent almost three weeks of their summer holidays working in Park, led by Dr. J. B. Caird, assisted by Miss Catherine B. Smith. The party worked in small groups, each making a particular study of one or two townships. Neither croft nor township boundaries are recorded on any published maps; these were obtained so that land use and house sites could be plotted on 1:2500 plans; details of crops and stock were recorded for every croft and an enumeration of population made for each household, the latter being done by Dr. Caird as a rule, with the help of local residents. Only in this way can a true picture of contemporary crofting be obtained, for official sources, such as the Census and annual Agricultural Statistics, deal mainly with counties, only occasionally with parishes, and never with townships. Yet it is the township groups which are the essence of Crofting.

114 The people of Park showed great kindness in answering innumerable questions with truth and
123 good humour. Their hospitality was quite overwhelming; without their willing co-operation this study could never have achieved any degree of completeness. It would be invidious to mention any single member; all did their utmost to help, but without Mr. MacMillan nothing would have been possible. It was he who found accommodation for the party in a community where tourist accommodation is almost unknown, and for this, and for much other help, we owe him a great debt. To our hostesses, Mrs. Campbell, 13 Gravir, Mrs. Macaskill, Heathrview, and Mrs. Macaskill, 13 Glengravir, we are perhaps in the greatest debt: they looked after us so very well and unsparingly, and from them we learned the values and outlook of the Park community. By way of pre-
114 paration, much help was given by Mr. D. M. MacKinnon, the estate factor, by Mr. Donald Mackay,
123 Ella Kershaidir, by the staffs of Messrs. David Macbrayne, of the office of the Registrar-General for Scotland, of Register House, of the Department of Health for Scotland and, in particular, of the
128 Department of Agriculture for Scotland. Finally, thanks are due to Miss Bridget M. Gordon, B. A., B. Litt., for the appendix on place names, and to the practical agriculturalist who made an assessment of the agricultural economy possible.

The township reports were prepared by the individual members and the editor contributed the general chapters. The editor would like to record here his personal thanks to the party. Few leaders can have been blessed with such cheerful enthusiasm, steady application and willingness to work long hours; they mastered the methods and techniques of the survey extremely quickly and added new ones. The quality of their field work may be judged from their reports. The checking, organising and filing of the data both in the field and afterwards, as well as the preparation of the tables for the present report, could not have been done without the skill and enthusiasm of Miss Smith. Thanks are also due to Mrs. Esme Diamond and Miss Smith for typing the draft and especially to Mr. I. A. G. Kinniburgh, Cartographer in Glasgow University Geography Department for re-drawing the maps and diagrams.

000 The value of the field work lies not only in the present report, but also in this permanent statistical and cartographic record in Glasgow, to which we hope present and future research workers will be able to refer.

PREFACE

121 The problem which I have attempted to treat in this study concerns the question of the effect of population change, both increase and decrease, on an essentially peasant population living on the very fringe of Western Europe in one of the last remaining outposts of the Gael. My interest in this problem, stimulated to no small degree by Dr. Conrad M. Arensberg and my wife, stems from an old curiosity about the nature and function of the Highland clan system and the characteristics of a small,
[101] dying remnant of a once widespread culture. My wife and I went to Scotland in June, 1953 to conduct field research on the Isle of Skye with the presupposition that the old culture had not withered and disappeared, even if it had been seriously modified by outside influences, especially those flowing in from the
[101] wider society of Great Britain. We remained on the Island until March, 1954, when we turned our attention to library research and exiled Skyemen in Glasgow.

122 The research embodied in my dissertation was made possible by financial assistence from Columbia University, in the form of a William Bayard Cutting Traveling Fellowship; from the Social Science Research Council, in the form of a Research Training Fellowship; and from the United States Educational Commission in the United Kingdom, in the form of a Fulbright Scholarship. I

Skye

122 am indeed grateful for this aid and the encouragement which this support implicitly extended.

114 The field work was carried out under the supervision of Dr. Thomas T. Paterson, of the Department of Social and Economic Research of Glasgow University. Were it not for his sympathetic understanding of the problems of the novice field worker, I might never have concluded the research. He also read many sections of the dissertation and offered helpful criticisms and suggestions.
128 I would also like to acknowledge the advice and interest of Dr. A. K. Cairncross, Chairman of the Department, and that of Mr. Angus Matheson, of the Gaelic Department, who guided me through many of the difficulties of the Gaelic language and, as a native of the Isles, read much of my descriptive material on his kinsmen with a critical eye. At Edinburgh University I wish to thank Dr. Arthur Geddes, of the Department of Geography, and Dr. Kenneth Little, of the Department of Social Anthropology, for their guidance.

One debt of gratitude must be acknowledged only by implication, because those who helped me want it that way. Although they are unnamed, their hospitality and their contributions of both facts and insights are not forgotten. To the men and women on Skye, to the Skye exiles in the Lowlands, and to the government officials in Edinburgh and Portree I extend my sincere thanks.

The personal interest of Professor William A. Hance, of the Department of Economic Geography of the Columbia University School of Business, has been an invaluable support. Drawing on

123 OBSERVATIONAL ROLE--techniques for establishing rapport; assumption or ascription of a status in the community; methods of altering the observer's status; adoption of the technique of participant observation; degree of participation in community life actually achieved; effect of the observer's presence on the life of the community; limitations imposed by sex of observer; etc.

PREFACE

121 allows one to revise judgments in a way not possible in a
178 short-term study. And only by prolonged knowledge of the Island can one hope to appreciate the changes which have been taking place, and the trends of today.

• 123 My chief debts are the hardest of all to acknowledge, namely the patient guidance, information and hospitality so freely given, as I tramped from end to end of the Island or stayed in chosen townships. Indeed, my debt extends beyond the Island, from glens in the mainland to the southern Hebrides. The debt for specific information received is the harder to acknowledge since, again and again, I was invited to utilise information on condition of silence as to its source. Many statements given here would gain in authority if their source, whether private or semi-official, could be given; but this has frequently been impossible without violation of confidence. Hence my thanks go out to many anonymous crofters, schoolmasters and residents and also to officials, particularly of the Boards or Departments of Agriculture, Fisheries, Labour
000 and the Post Office. There are also those whom I cannot leave unnamed, particularly the late Mr. W. J. Gibson, C.B.E., Mr. Angus MacLeod, B.Sc. (Agric.), Dr. R. M. Craig, Miss Bruce of the Highland Home Industries, Mr. J. S. Grant of the *Stornoway Gazette*, Mr. Malcolm MacLeod, D.Litt., Mr. A. M. Macmillan, C.I.E., Mr. John Forbes and Professor A. C. O'Dell. The late Professor Alan G. Ogilvie, Professor H. J. Fleure, LL.D., F.R.S., Professor W. Croft Dickinson, M.C., and the late Mr. Adam Collier also advised me most helpfully.

For the loan of blocks I am indebted to Professor A. Stevens and Dr. R. R. M. Craig, and to the Editors of the *Scottish Geographical Magazine* and of the *Transactions of the Royal Society of Edinburgh*.

175 Mackenzie. For all that, in 1900 a crofter said: "We called
613 the old proprietor Seaforth, but I believe his right name
621 was the Prince of Welsh". To him the Earls were royal!
[829] Freedom of intercourse is embodied in the language to this day. With 'a stranger', a little spoken Gaelic
197 lessens 'strangeness' and quickens intimacy, because Gaelic conveys essential human relationships as English
565 rarely can—even the English of the 'democratic' Low-
576 lands. For instance, a well-dressed stranger, though young, is usually addressed in English as 'sir' by a senior crofter, and, just as in the South, without the expectation of 'sir' or 'ma'am' in return. In English, that is, respect is given to class. In Gaelic, age receives respect: it is the stranger, if the younger, who adopts the respectful 'you' (the second person plural, *sibh*), while the crofter, if the older, uses the friendly singular, 'thou' (*thu*). If they are of equal age, and neither is elderly, 'thou' would be
[562] used by both. Similarly, respect is given to womanhood; and an older woman who would say 'Sir' in English will say 'My dear' in Gaelic.[1]

614 It is not only by daily contacts that we may understand the relationship of people to chief, but by the height of feeling it may attain, and by the beauty of its expression. Among the finest of the later songs of praise to Gaelic
[175] clanship and its chiefs are those composed by two Island
[533] bards, a woman of Harris and a man of the Lews. Mary MacLeod, *Mairi Nighean Alasdair Ruaidh*, was a kinswoman of the MacLeods of Dunvegan and Harris, and a beloved

• [123] [1] Calling on the sub-postmistress in a Highland place where I was known to be a friend of the laird, I was addressed as "Sir". But hardly had we passed to Gaelic when this woman, my elder and a person of culture, laughingly used an expression then strange to me. Halted, and suddenly shy at being forced to translate, she said at last, "When thou wast *a lump* [just a boy!] '*muair bha thu cnap!*'". But rightly, she would have been slightly shocked had I said 'thou' to her.

114 reports of early speeches by Leverhulme, Professor Patrick
185 Geddes had quickly come to feel that his old acquaintance,
473 Leverhulme the industrialist, might have overlooked such
433 agricultural potentialities as existed, and that he had quite overlooked the social significance of land. Hence, in May or June 1919, Geddes proposed that a survey be made by one who knew the Highlands botanically, who was experienced in agriculture, and who had some knowledge of Highlanders at home and of sociological factors. Geddes
• [123] suggested Dr. M. E. Hardy for the task. Leverhulme forthwith accepted the suggestion and commissioned Hardy, whom the present writer assisted on the Island.

311 Examination of the farms, so hotly debated, showed that they possessed little or no initial superiority over neighbouring crofting settlements. That the farms were placed in the best coastal tracts for agriculture is true, but their shores are at the same time the poorest in harbours and fishing facilities. As a result, the crofters dwelling near the farms along parts of the same machars and smooth slopes were 'crofters' who sometimes fished, rather than fishermen with a house-site and a potato patch. As Hardy wrote (in his MS. Report): "The chief superiority of the farms resulted from levelling, drainage and enclosure" by landlord and farmer, sixty or seventy years before. The improved land both of farms and adjacent crofts was reclaimed from peat and machar, or from an admixture of both. "How then", asked Hardy, "did so much value
[473] come to be attached to the farms? The traditional grievance (of eviction) led neighbouring crofters to turn their eyes towards the green patches of the abandoned villages and endowed the old land with special virtues. After the Crofters' agitation of the 'eighties, successive Boards came with their eyes already focused on the farms, by the

PREFACE

114 121 This report is the result of a remarkable co-operative enterprise. In August, 1959, a party of 19 members of the Geographical Field Group and Scottish Field Studies Association undertook a survey of crofting in Uig, one of the four parishes of the Isle of Lewis. In less than three weeks more than 700 crofts and other households were visited or recorded in accordance with a scheme devised by my colleague, Dr. Caird, and myself. This scheme has been used by us in other parts of the Hebrides and, therefore, the record of Uig is an integral part of our Outer Hebridean crofting survey, undertaken between [122] 1956 and 1961. We are extremely grateful to the nineteen voluntary field-workers who, it is worth recording, travelled from England and stayed in Uig entirely at their own expense in order to help us; they could have spent their holiday more cheaply in Switzerland - an enlightening comment on the fundamental economic disadvantage of the Hebrides.

125 [121] The object of the work was to make an impartial record of the state of crofting as a way of life and as a means of livelihood. The boundaries and land-use of every croft were recorded on 1/2500 plans, enquiries were made as to acreages of crops and grass and numbers of livestock, and the population of each household was recorded, taking account of sex, age and occupation (part or full-time) of each member including those who, perforce, must seek work elsewhere even though their only home is in Uig. The Croft Record form is reproduced opposite.

122 The successful completion of the survey was not only due to the co-operation of the Geographical Field Group and Scottish Field Studies Association. Adequate preparation would not have been possible without the advice and help of officials of the Department of Agriculture, County Council, Scottish Land Court, Crofters Commission, David Macbrayne Ltd, the estate factors and many other bodies. Miss C.B. Smith, Carnegie Research Assistant, undertook much of the tedious preparatory clerical work. In Uig 123 itself we were encouraged and assisted wherever we went. We owe exceptional debts of gratitude to the Ministers, school-masters and township clerks, who welcomed us and made our purpose known throughout the parish, also to the families who took us into

121 by help of oral tradition and of the living witness of con-
174 tinuing usage, we can reconstitute Gaelic life from the
178 view-points of both people and chief. Elsewhere, even in Scotland, only fragments of early life are recorded, in
175 parchments written by the lawyers of landlord and king,
814 and almost always from the privileged side. History is indebted to modern lawyers who have deciphered and
• 127 published the faded documents of their predecessors. But the very training as solicitor-factors which fitted them for this specialised task, in no way prepared them to view life as seen, experienced and felt by the men and women of the past, or even by the elders or youth of the townships today, with whom they have rarely laboured and whose mother tongue they rarely understand.

(A) THE LABOURS OF MAN AND WIFE, AND THE REWARD

621 We have seen that until the nineteenth century the
632 township in the main was self-contained. Its people grew,
175 reared or caught their food, and also found the raw materials
[433] for their clothing; they built their own shelter, and cut their own firing. As a result, both men and women had
174 each to develop "a wide range of simple skills", in the
175 apt phrase of a Lewisman, Mr. Donald MacLean, M.A. Beyond the co-operative effort within a family, a farm
462 group, or a body of 'fellow-townsmen'—in which each was competent to take a share according to sex and age—aptitude and family tradition initiated some local division
[463] of labour. The resident smith and the 'caird' (usually a wandering craftsman or tinker) appear in the oldest tales and in the first rent-rolls. In addition there were honorary
[759] tasks. The smith might act as the village surgeon, ready

194 encouraging them to rest when the men returned was
462 fondly indulged. Much can be learned from the first (or
221 'old') "Statistical Accounts of the parishes of Scotland
175 drawn up from the communications of the Ministers of the different parishes", *circa* 1790-96. Of the parish of
462 Stornoway, where by 1790 many men had become crofter-
• 127 fishers and others were at sea, the Minister wrote, "The women labour at least as hard as the men", even pulverising the ground with heavy hand-rakes (harrows being seldom used), and digging both with crooked and straight spades. That the men's debt was repaid in acts of manly service is true. A man would carry wife or sweetheart on his shoulders across a river in spate, whose rushing waters might have swept her away. But in her turn, a woman would wade into the cold sea, her coats high, bearing on her hips husband or son out to his open boat, so that he could start his night of exposure dry-shod and warm. This act of service was noted and illustrated by Burt at Inverness (about 1726), and it was common in the Lews before the building of stout piers, that is within living memory. Strong common sense, sheer necessity in fact, enforced such mutual service; but the sacrifice entailed was nerved by anxiety for those in danger, by personal pride and love. It was also true that it bore hardly on women, with their readiness for self-sacrifice and their ordeal of childbirth.

175 What return for their labours did the people get in the
434 past, it will be asked, and what approach to sufficiency in a normal year? For the Island, the most thorough of the
[129] five Parish Accounts is that of Harris, with its fascinating retrospective notes (vol. x, p. 368). There the yield of a typical family share, a 'fourth' or 'farthing' land, was computed at "from four to five bolls" (which in Scotland

175 couple advancing one on either side of it—many other
476 tasks were definitely team-work. Such was peat-cutting. "When they are making peats, five people are employed.
175 One cuts the peat, another places it on the brink of the
476 ditch where it is dug; a third spreads it on the field, a
314 fourth pares and cleans the moss; and a fifth man is resting, ready to relieve the man that cuts. The women are seldom
[462] at this work, but the men help one another alternately; sometimes they must rest satisfied with fewer hands; but the above is the full complement of men required to per-
• [127] form the work, according to their tastes." Buchanan's
[178] description was written 160 years ago (1793); it remained true till recently and generally it is so still. There was thus a normal team practice for work—even a man to rest was not
[538] forgotten! As the Gaelic proverb puts it: "They won't make power (add strength) without a threesome and they'll limp without a foursome!" (*Cha deanar treine gun triuir,*
[802] *'s bidh iad crubach gun cheathrar*). In Gaelic, as in Scots, one speaks of a team according to its number, as "a pair, a threesome, foursome" and so on, up to a tensome (*deichnear*). In Lewis the farm-team was usually a foursome or fivesome.

175 Only in exceptional cases was land worked and held
423 singly—as when a smith was kept busy at his anvil in ploughing-time and harvest. Thus in 1715 one or two
241 rural smiths had single holdings of average value or more
[326] (£1), and one artificer or tin-smith (caird) a holding of minimum value (5s.); and in the burgh all the small plots
[286] were held singly. As the women wove, at home mostly,
[462] no male rural weaver held a single plot; his weaving could be done at slack times, so long as there was light; at busy times he worked on the land with the rest of his team.

000 On the mainland, both Lowland and Highland, an

175 after 1800, John Walker wrote that run-rig, " formerly very
178 general in Scotland, was abolished with improvements but
241 still subsists in many parts of the North. A number of
476 tenants of the same farm have a common pasture for their
654 cattle, and the arable is divided among them, by ridge
423 and ridge alternately, which each cultivates for his own behoof. This gives them all a common interest in the crop and, when there was no inclosure by dyke or hedge, might be of some advantage " in giving each person some protection " against the encroachments of his neighbour's cattle ". Speaking of joint possession this time, though without reference to survivals, Walker wrote that in the Lowlands " in old times a large farm might be occupied by a number of conjoint tenants who cultivated the farm in common and divided the produce. In this way the interest of each became the interest of the whole. They were ready, and were frequently called upon, to defend the common crop and cattle against depredations. There was then a necessity for such an allotment of land, especially in the Border country and in the Highlands." The team, in other words, was a unit of defence. But " nothing like improvement can be expected from farmers placed in this situation . . . [and] no community can ever equal the carefulness and industry of an individual in the management of his affairs ".[1]

[127] So far as it goes, such an analysis is incontrovertible;
for Walker was one of many contemporary observers
[181] who could contrast both the " improvement, industry and carefulness " of the best individuals under a vigorous landlord, with the sluggishness of old-fashioned ways on backward estates. The fundamental reason for sluggishness was that

[113] [1] John Walker, *Oeconomical History* [descriptive account] *of the Hebrides*, 1808.

241 through division of labour or united effort, but simply for
423 the sake of mutual stimulus and pleasure!
427
476

(D) THE SHARING OF MACHAR, MOOR AND SEA

Embracing several joint-farms, each with its team or
175 crew, came the township. The township had not only its
632 common pasture, it had a special extensive system of
241 run-rig on sandy, coastal machars, as in parts of the Island
423 and in Uist—a system continued to this day.

On the machar of Barvas, cultivation strips are still re-allotted periodically, as they were annually on all the
632 Island machars. The machars behind the ' storm-beach '
241 dunes of the Outer Hebrides closely resemble one another,
423 from the Butt of Lewis to Barra Head. The immemorial system was noted by Walker and more fully by Carmichael,
[178] who called it ' intermediate run-rig ' to distinguish it from
[127] the run-rig of older joint farms on boulder clay, and it persists at the present day.[1] In North Uist the machar land is laid off in large scatts or fields. Each scatt is divided into as many rigs as there are crofts in the township. There may be a dozen scatts in all, and usually half the number are lying out in natural pasture, but they are put under crop in rotation, so that each year one or two scatts will be brought into cultivation, and the others left out after a
[625] course of cropping. When a scatt is to be brought into cultivation the township ' constable ' (who holds sway under the district ground officer) appoints a day for allocating the rigs.

[113] [1] Walker (1808); Alexander Carmichael, appendix xlviii and xcix, pp. 213 ff. and 451 ff., Report of the Crofters' Commission, 1884. Socially these form the most significant evidence in this great Report. See also " Grazing and Agrestic Customs ", *Celtic Review*, 1905. Cf. C. Macdonald, *Scot. J. Agric.*, 1919. 771 single example may be given; so far as I know, it is un-
773 recorded. I learned it in South Uist, where Catholic and
Protestant mingle in tolerance and sympathy; it had been
125 told by an old woman, a Catholic, to a young neighbour, a
1745 Protestant fisherman's son, later a minister.[1]

The story takes place after the Crucifixion. It may be
remembered that in the Gospels not a word is said of Jesus's
mother after His farewell to her from the Cross (John,
xix. 26). He—or she—who first conceived the legend may
have asked, would not a mother visit the tomb of the son
she had just lost? And surely she who at His birth had
cried, "My soul magnifies the Lord . . . my Saviour",
would be the first to seek Him out after His death? The
legend tells that, on the second day of the Entombment,
Mary, Jesus's mother, in an agony of mourning and sus-
pense, visited the tomb of her son, calling upon Him with
many an endearing name. From the tomb He answered
that she would be consoled, for He would arise. And He
told her that because of the depth of her love, of all forms
of human love a mother's would be accounted the highest
for ever after.

771 The Gael had fused the grandeur of the Old Testament
538 with the hope and humanity of the New; for them the
light of dawn on sea and snow awoke the light within. A
1788 last example is taken from two fragments forming part of
113 a single theme, perhaps of one original poem.[2] Chanted

[1] It is interesting to compare this quiet legend with the late Roman (and Epicopalian) "Apostles' Creed", apparently based on the vivid story in the *Gospel of Bartholomew*: after Christ "was crucified, dead, and buried, He descended into hell" (hades). Montagu R. James (translator), *The Apocryphal New Testament*, 1924.

[2] *Carmina Gadelica*, 201, 197. No translation can be perfect, and Carmichael offers alternatives: line 6, "*Ti nan dul*, Being of life", or "of the elements"; l. 13, "light on the plain" or "the land", *fearann*. The last line is intimate and simple: "The hour (or *era*) God's Son came in (among us)," a *steach*, as into a dwelling.

178 intuitive and traditional, of the people, and their love for
181 the good and beautiful. Song collectors from outside the
Island have found little and assumed that song had been
114 swept away. Discretion is certainly needed for song col-
533 lection! Years ago in Bernera I had been told of a pretty
love lament I had not heard. Calling with my hosts to
125 invite him to their house that evening, we found the singer,
533 a burly crofter of fifty or so. We had been about to
183 mention the word 'song', when the word was checked on
our lips by a swift, warning glance. The singer lived with
his old mother and she must not be told that her son went
533 out on such an errand! Nevertheless, Islanders them-
178 selves are collecting many unpublished songs, where
814 strangers failed. The Laxdale School choir wins prizes at
many a national gathering or *Mod*, for their spirited singing
of songs, many of them unpublished. Owing in part to
their very isolation, these songs have remained as pure in
form as in the Catholic Isles, whether in time and rhythm
or in scale and mode. Thus the sub-intervals or 'quarter-
tones' of the modal scale add subtlety to the melodic line
of an air, as in the melodies of Wales or of distant India.[1]
These intervals are rarely heard on concert platforms,
being unrecognised by many 'Mod medallists'. They
are rarely known to professional musicians trained to
the mechanical scale of the piano, and who are asked,
as adjudicators, to award praise or criticism by alien
standards.

181 Courtesy and modesty are noticeable among the young

[1] M. Kennedy-Fraser, Preface, *Songs of the Hebrides*, vol. i. Cf. Glyn-Williams, *Welsh Song and Dance* (Curwen, 1936). For India see A. H. Fox Strangways, *The Music of Hindustan* (1914), pp. 104 ff., and H. A. Popley, *The Music of India* (1921); cf. A. Geddes in A. Karpeles (ed.), *L'Inde et son âme*, Paris, 1927. While published phonographic records of Indian singing normally illustrate these intervals, those of Gaelic Hebridean singers rarely do, as they are accustomed to alter to suit a piano.

PREFACE

114 This report is the result of a remarkable co-operative enterprise. In August, 1959,
122 a party of 19 members of the Geographical Field Group and Scottish Field Studies
Association undertook a survey of crofting in Uig, one of the four parishes of the Isle of
Lewis. In less than three weeks more than 700 crofts and other households were visited
or recorded in accordance with a scheme devised by my colleague, Dr. Caird, and myself.
This scheme has been used by us in other parts of the Hebrides and, therefore, the record
of Uig is an integral part of our Outer Hebridean crofting survey, undertaken between
1956 and 1961. We are extremely grateful to the nineteen voluntary field-workers who,
122 it is worth recording, travelled from England and stayed in Uig entirely at their own
expense in order to help us: they could have spent their holiday more cheaply in
Switzerland - an enlightening comment on the fundamental economic disadvantage of the
Hebrides.

Scottish Field Studies Association

Miss F. Madge Phillips Mr. Roger H. Thomas

125 The object of the work was to make an impartial record of the state of crofting as a
122 way of life and as a means of livelihood. The boundaries and land-use of every croft
were recorded on 1/2500 plans, enquiries were made as to acreages of crops and grass
and numbers of livestock, and the population of each household was recorded, taking
account of sex, age and occupation (part or full-time) of each member including those
who, perforce, must seek work elsewhere even though their only home is in Uig. The
Croft Record form is reproduced opposite.

122 The successful completion of the survey was not only due to the co-operation of the
Geographical Field Group and Scottish Field Studies Association. Adequate preparation
would not have been possible without the advice and help of officials of the Department
of Agriculture, County Council, Scottish Land Court, Crofters Commission, David
Macbrayne Ltd, the estate factors and many other bodies. Miss C. B. Smith, Carnegie
Research Assistant, undertook much of the tedious preparatory clerical work. In Uig
123 itself we were encouraged and assisted wherever we went. We owe exceptional debts of
gratitude to the Ministers, school-masters and township clerks, who welcomed us and
made our purpose known throughout the parish, also to the families who took us into

125 INDIVIDUAL CROFT RECORD

DATE OF VISIT _____ TOWNSHIP _____
CROFT NO. _____

In addition to cropping land area, and stocking industrial houses (on 1/2,500 map), the following should be recorded, if it is not more or less obvious, in not the number for all this data. Mark one to obviated by observation.

1. THE CROFT
Name: Old spelling: Pronun.
No. of shares in (a) common hill: (b) common arable: (c) any special commons rights (Give details)

2. CROFT (Areas in half an acre)
Have much is cultivated for: (a) tenter _____ (b) hay _____ (c) spade _____
Area, this year, in

OATS:	Crofts	Stockers	
BERE:	Crofts	Stockers	
RYE:	Crofts	Stockers	
MIXED GRAINS	Crofts	Stockers	
POTATOES	Crofts	Stockers	

NON GRAIN FOR HAY: _____ (YEAR NOW) (N___)
NON GRAIN, GRAZING: _____ (YEAR NOW) (N___)
NATURAL GRAIN, HAY: _____
NATURAL GRAIN, GRAZING: _____
How much of natural grass was formerly cultivated:
(a) in last 20 years: _____ (b) 20-50 years ago: _____ (c) More than 50 years ago: _____
Was any of the hill common (or special commons if any) formerly cultivated? Give details (on reverse)
Have shielings ever been used? Give details (on reverse)
Peaty grubber: YES/NO. Produce marketed: YES/NO (Specify)
Fertilizers etc.: SEAWEED/SHELL-SAND/LIME/ARTIFICIALS (Specify)
Crofts: FENCED/NOT FENCED. If fenced are they open to common grazing in winter? YES/NO. If yes, when dates
3. STOCK (Give number at present. If possible add to previous census and in past 12 months)
CATTLE: 2 years: ____ 1 1-2 years: ____ 1 year: ____ 1 Calves: ____
SHEEP: Breeding ewes: ____ 1. Other sheep: ____ 1. Lambs at lambing: ____ 1. Lambs at end of September: ____ 1 Tup
(Count equal number of lambs)
IF CLUB STOCK STATE SHARE _____ (and shortcut, if possible) _____
HORSES: _____ POULTRY: _____ PIGS _____
4. HOUSE, etc. (Ring industrial houses on map)
Houses on croft? YES/NO. Is it OCCUPIED/UNOCCUPIED/RUINED? More than one? If so give details. FEU/COTTAR etc.
Numbers of household in age groups (Ex Indo, F=Female) (Indicate tenant of croft)

Age 1-4	Age 5-15	Age 16-44	Age 45-64	Age 65+
(a) PERMANENTLY RESIDENT:				

(b) PERIODICALLY AWAY (Seen persons (e.g. students, seasonal workers) give occupation) (Relation Servicemen)

(c) PERMANENTLY AWAY, but having an other home (e.g. Fishers, Hi.Ferry, Regular Farmers)

(d) INCOMERS (Y?) and EMIGRANTS (N?) since 1939 (In and from parish)

shopkeepers and so on. But some were with weaving on a source of regular income. Without the weavers most of the others would find little demand for their wares or services.

Periodic work is taken locally, usually in default of regular employment, and often by people who formerly worked away from home. This is usually casual labour and fishing, and is due to the lack of other opportunities in South Uig. Whilst no survey was in progress, it was noted that fishing was more than engaged at the Gaia hydro-electric scheme. In South Uig, also, crofting was not regarded as regular than elsewhere. For this some weavers blamed the Harrowy products, and some of the crofters are not inclined to send wools so far out as this unless it cannot otherwise be done. There is some truth in this, particularly with respect to the 'small' (i.e., non-mill) producers, but a survey of sheep stocks showed that more than in South Uig regarded weaving as an 'extra' and not as a means of livelihood, or when alternative employment, as the craft or for wages (as at Gaia), was offered. It is also true to say that the less weaving a man does the less good he becomes, he takes longer to complete a web and may suffer more deductions for faulty work. He becomes less interested in the work and the producer becomes less inclined to send him work.

TABLE 56

Permanent Employment away from home (actual numbers)

	Men				Women			
	R.C.	Presbyterians	Others	Marriage	Marriage	Professions	Domestics	Others
Uig Parish	46	11	65	-	-	18	39	27

East Loch Roag	16	-	23	15	6	15	7	
Carloway	22*	3	25	12	5	5	5	11

* including five working seasonally on whalers.

These taking permanent employment away from home (table 56) tell to choose particular occupations. Amongst men, the Merchant Navy is most popular, especially from the Carloway and East Loch Roag districts; many of the others work as skilled or semi-skilled jobs, including the joiner, plumber, and mason. There are also skilled casual labourers. Amongst women, nursing is by far the most important occupation, and domestic work is popular amongst young women from South Uig and Bernera; most of the others work in 'domestic work' - in hotels and hospitals, rather than in private homes - and a few work in offices and shops. The category 'professions' in the table is almost synonymous with school-teaching.

Periodical, including seasonal, absence from home is less common than from some island districts; 14% of the 15-64 age-group is classified as 'periodically away' (compare 27% from Park, 18% from Harris, 17% from Barra). Of these, half the men and half of the women are students. Seasonal hotel work, for women, is the most important single category.

Population trends

162 The diagrams, figure 48, summarise much of this chapter. They have been constructed so that the size of each horizontal bar is proportionate to the number of persons in the

162 appropriate age-group, males on the left, females on the right. The width of the bars varies according to the age range of the groups so that the length of each bar gives an indication of the relative importance of the particular age-group in the total population. As an unofficial survey it is difficult to obtain detailed information on the 65 and over age-group. Some bars are triangular, nevertheless they do suggest certain trends, as well as marked regional differences, within the parish.

162 If we examine first the parish as a whole it will be seen that the proportion of children under school age, (0-4), is sufficient to maintain, and perhaps to slightly increase, the school population (5-14) provided that none are lost through emigration. The present school population is not quite sufficient to maintain the 15-44 age-group, including, of course, those working away, on the same assumption. In both these groups, as is usual, males slightly outnumber females.

The characteristics of the 15-44 age-group are clearly seen. A large number is working away from home. The proportion of women working away is far greater than of men and, in view of the "marriage risk" in women in this age group, it is reasonable to suppose that, in time, most of these women will become 'emigrants'. More men stay at home (weaving supports many of them) and, of these that go away to work, a substantial proportion will return to the parish on the occurrence of a croft or when they retire; some of them may bring back wives from outside the parish but it seems unlikely that this will by any means balance the loss of local women by marriage outside the parish.

The 45-64 age-group is only slightly affected by the custom of working away. Men and women are evenly balanced, but when we compare them with the 15-44 group it is seen that, over ten years or so, there will be a decline particularly in the number of women aged 45-54 available for marriage. Of the women under 45, who are at present working away, eventually many will settle outside the parish, the decline will be drastic. The 45-64 age-group should, in time, replenish the 65 and over, but, as far from the diagram, it is not so. That this is not possible. At present an accurate forecast of the population is over 65 years of age and thus, in time and failing the unlikely event of additional immigration, a further fall in total population is certain. One may hazard a guess that this decline will be of the order of 300 to 350 persons in the next ten years.

162 Turning to the districts, the most striking feature is their individuality and this emphasises again the value of this kind of survey. Generalisations about the parish cannot be misinferred from the official census reports. In South Uig, of the 65 and over, a very high proportion is over 65 years of age; this makes it certain that further decline is inevitable. However the 15-44 group can probably replenish and maintain the 45-64 group with little loss; the relatively high proportion of children, particularly under school age, suggests that the 15-44 group in South Uig will be adequately replenished, except that there is an unusually low proportion of young women in the 15-44 group. A large proportion of young women from South Uig take employment away from home, as do young men, and this suggests that South Uig may have a special problem here in a small degree, and this suggests marry and settle away from home. The Bernera district shows considerable similarity to South Uig, but the proportions are different and not quite so extreme. The East Loch Roag district, and to an even greater extent the Carloway district, has quite different characteristics which suggest rather different trends. There the predominance of old people is not quite so marked and, in fact, it may remain in passing, the excess of females over males in the over 65's is quite noticeable. Going back one generation, amongst the Naval reservists and others, from the 45-64 group, to the World War. If we look at the proportion of children, however, it is clear that the school population can scarcely be maintained over the next ten years, nor can the 15-44 age-group be fully replenished. This, of course, assumes that there will be no material change in birth and death rates. Taking, for example, Carloway, it seems that, although population will inevitably continue to fall in South Uig and Bernera, it will be at a prospect of a more stable, though smaller, population in within eight. But in East Loch Roag and Carloway districts it seems likely that decline, though perhaps not so rapid, will continue for a long time yet.

127

ACKNOWLEDGMENTS

I have to acknowledge the valuable help of many people in the completion of this book. Some aided by the mere mention of a fruitful source of information. Others, such as the officials of the various Government offices I contacted, went to much trouble and otherwise available to me as a private individual. The *Scottish Gazette* has been more than helpful in making its files and office facilities available for research. And Mr I. R. MacKay of Inverness did me the kindness of reading through my draft manuscript and commenting on those errors and omissions which would have detracted from the final script. Any mistakes and inconsistencies which remain are to be laid at my door.

127 HISTORICAL RESEARCH--extent to which original field research was supplemented or replaced by the use of records; types of records utilised (e.g., archeological remains, unpublished documents, museum collections, census data, literary sources, earlier published materials); techniques of analysis and criticism applied in assessing source materials; etc. See also:

18 pastoral group, the germ (in the Hebrides) of the present
621 township with its common grazing. Hamlets and town-
174 ship formed circles of cultural and religious life in common.
[423] These 'sociable hamlets', or 'little commonwealths', as
they were called by understanding writers on the High-
lands, lived on in the Hebrides almost until a century ago.
Features of their form and life have long been known, but
their life has not yet been envisaged in its full dynamic
significance.

• 127 The homesteads, informally grouped in these small
36 hamlets, have been mistakenly described as solitary or
174 'dispersed' by scholars accustomed to larger and more
compact grouping. The mistake was made by geographers
[423] of the nineteenth century, such as Meitzen with reference
to the hamlets of Brittany. Similarly, because of the
[476] small number composing a typical joint team, the vital
fact of team-work and joint holding has frequently been
overlooked; yet a fundamental mistake is made when such
close-knit team-work and joint tenure are described as
174 'individualistic'. Moreover, these teams were linked to-
62 gether in larger, more loosely bound pastoral communities
of township and district. In Scotland and elsewhere, it is
[241] true, such hamlets came historically to be split up in various
[198] ways, into smaller farms and scattered cottages. The
larger link of common life was also superseded by the
proprietor's estate. Indeed, the twofold revolution in-
volved caused a fundamental regional cleavage within 'the
North and West'.

[182] Partly as a result of their small size, the tenure of farm-
[184] hamlets was frequently infoqmal. In northern England,
[178] the hamlets and their lands were not entered in Domesday
Book; still less are early entries complete in Scotland.
For this and other reasons, jurist and historian may fail

175 that the spade and foot-plough (*eas chrom*) were used for
185 ploughing. From Monro and from the
311 precise Statistical Accounts of the eighteenth century, it is
clear that pony-drawn ploughs were usual in the smoother
[241] parts of Lewis. In North Harris are 'abundance of
• [127] Deir'. We must not forget here that 'faire' and fertile
[136] are comparative terms for the West. "Lewis is faire and
weill inhabit at the coste, ane fertile and fruitful countrey,
[226] for the maist part [barley], with a Parochie Kirkes."
There is "ane castell callit Stornoway . . . with 3 salt
36 loches, very fine for take of herrings . . . [and] infinite fresh
water loches. In the Lewis there are 8 waters with take
of salmon. . . ." There were also "Whales . . ." In
[423] "a cove 2 fadoms deep at the ebb sea, uses Whytuns
(whitings) to be taken with hakks". There were "very many
haddocks and Men with their wandes sitting [as today]
upon the Craiges of that cove, and Lades [boys] and Women
[136] also. . . . In this Ile there are many Sheip for it is very
guid for the same. For they lay furth ever one mures
and glens and never enters in a house and their wool is
not anes in the zeire pluckit off them in some fauldes."
[136] In Zetland wool is still plucked, not shorn.

The description of reclamation is specially worthy of
note: "In this countrey all is peit mossland at the Sea
cost, and the place where he wins his peitts this zeire
[year] . . . there he sawes his corne the nixt zeire, after
that he guidds it weill with Sea ware" [*i.e.*, improves or
[245] manures it with seaweed]. On "Ellan Colm Cill [an aiso
apparently on the east coast south of Stornoway at the
mouth of Loch Erisort] Macloyd of the Lewis has ane faire
Orchard, and he that is Gardener has that Ile [rent]
free. . . ."

175 Around the coast of Lewis no absolute limit is set to
185
311

drawn up for the Crown sometime between 1577 and 1595.[3] In 127 1630 a short commentary on the social, religious, and economic life of Skye was penned.[4] Finally, at the close of the century a native son wrote the first detailed account of life on the island.[5] Thus, I have had to rely on stray fragments, gleaned 128 from such material as can be found, and on later works. This is a handicap which may leave my interpretation open to criticism, but the statements of these authorities have been used to fill out the details of an established pattern only when their accounts are beyond reasonable doubt.

The Bare Bones of History

Although the Archaeological record for the Isle of Skye 174 can be traced back as far as 2000 B.C., when Neolithic man 172 became the island's first inhabitant, the evidence suggests a series of invasions and withdrawals by people at varying stages of development rather than a continuous local development.[6] Indeed, no one has uncovered any evidence for settlement between the fourth and seventh centuries. At the same

114 It is only in the distant past and comparatively recent times that governmental inquiries and enactments give a glimpse into the culture. For well over a hundred years after the abolition of the clan system the British government showed no inclination to become involved in the local situation. While the American colonists rebelled because taxation without representation was no less than tyranny, the Islanders suffered in silence under the laws of the Kingdom. Two works, however, [127] do give a picture of life on Skye. These are the (Old) Statistical Account of Scotland and the New Statistical Account of Scotland.[1]

121 The conceptual scheme which has been adopted to reduce national history to culture history takes two points of departure.[2] On the one hand, there are four well defined periods marked by innovations in the economic, social, and religious aspects of the culture and varying rates of population change. On the other hand, there are the overall trends of culture 101 and population change and the continuity of the culture. The #175 dates selected to mark the beginning of each period are: 1745, 1811, 1845, and 1886. The year 1745 is the conventional date for the beginning of the modern period of Highland history. It also marks the beginning of a prolonged period of population

Chapter 3

CHANGING ECONOMIC STRATEGIES: LAND, SEA AND LOOM

178 288 128 In Lewis, the change from a relatively self-sufficient community in which land and sea provided the economic base occurred in the context of the phenomenal rise of the Harris Tweed industry. In the following pages, the history of Harris Tweed is discussed in relation to changing strategies involving exploitation of land, sea and loom. Associated features of social life are discussed. Social boundary systems are defined and discussed in Chapter 4.

A. The Sea

175 228 [501] [471] [494] Around World War I, nine boats, as long as 27 to 30 feet, driven by sails, used to go out regularly from the Shawbost harbor. From five to seven men, usually neighbors, had "shares" in a boat. They would go out fishing during the night and return the next day. "We [433] baited our lines with eel, for ling. We would catch maybe two or three hundred. I remember once we caught 1300."

CONTINUED FROM PRECEDING FICHE

175 'first-footing'. In the past the lads came in bands singing
796 carols, and once admitted—refusal of hospitality being out
178 of the question—any misunderstandings and quarrels of the past year had to be forgiven and forgotten. With individual visits this is no longer possible, for though these maintain friendship, they cannot easily and naturally heal a quarrel.

175 From Lewis three fine carols once sung by youths are
796 recorded, of which the fidelity of Carmichael's translation
533 goes far to render both sense and feeling (Nos. 55-57).[1] In Ness I have sought in vain for the old melodies from
•[127] the descendants of Angus Gunn. Born about 1800, Gunn had lived for many years as a shepherd on the islet of North Rona, unreached by the burning zeal of the Evangelists, so that his traditional piety survived. Could they be found, these melodies would enrich the remnant of authentic Christian lore in Britain, for even the well-known English carols are mostly of modern reconstruction.

The first Christmas Hail opens, "*Ho Ri*, Hail to the King, Blessed is He. . . . Blessed be the house and all therein. . . . Lasting . . . and healthy round the hearth be ye. . . ." It goes on, "This night is the eve of the great Nativity, the great Noel [*Nochd oidhche Nollaige moire* . . .]; Born is the Son. . . ." It closes, "Shone the mountains . . . earth, and land, Heard was the wave upon the strand. . . . Blessed be the King . . . to all ages, to all time." A fragment from Tolsta, Lewis, sung by boys on New Year's Eve as they begged for a Noel bannock from house to house, latterly began and ended with playful nonsense, yet it retained its traditional climax: "[On the first day of the New Year] I saw the Threesome [The Trinity] going to the shore. The land shone, the

[113] [1] No. 59 is set to an Eriskay chant in *Songs of the Hebrides*, vol. i, p. 159.

788 (in Gaelic) by a housewife in a Catholic isle, as our friend-
592 ship matured. It had been said nightly at her fire by her
354 father-in-law until his death (not long before), which had
539 come after that of his wife. "I smoo'r the fire tonight, As Mary's Son smoo'red. Be it well with house and fire; Be it well with all our household. Who are on this floor? Peter and Paul. Who are on watch tonight? Light-white Mary and her Son. Thus God's voice taught, And the Angel spoke: The Angel at my house door, Until the clear day come tomorrow. Amen." As this variant shows, memory still lives in the Isles.[1]

788 In these runes, the key to the words "as Mary's Son
592 and as Mary did, in their day" is the example of filial duty,
796 of wifely and motherly care. In spite of lapses to 'Mario-
[799] latry' during periods of decadence in the Roman Church, the virtual banishment of Christ's mother from Protestantism has led to a loss deeper than Presbyterian Scotland has yet realised. Her name was a daily reminder, both of a woman's part in the spiritual life of the home, and of a son's self-discipline and affection: in a word, of mutual love.

788 For wool, the sheep were blessed, as in the "Clipping
[236] Blessing". There were blessings of the loom and of
[286] warping and weaving; and after neighbourly fulling or
[461] 'waulking' of the finished web, came its consecration. As the work was solitary and communal in turn, so the prayer. Carmichael's own fine prose translations should be
•[127] studied (*Carmina*, vol. i, Nos. 108-113; cf. vol. iv, pp.
[538] 88-99). Yet, those being available, we quote rhythmic

[113] [1] Cf. Rev. Allan Macdonald, *Comh-chruinneachadh*, p. 107; *Carmina* (Nos. 84-87, 324-326); and M. Kennedy-Fraser, *Songs of the Hebrides*, vol. ii, p. 31. Sacred lore is not to be picked up lightly by a stranger. It was only upon the second of my prolonged stays under her hospitable roof that this good woman would admit and impart her knowledge, treasured in the secret places of her heart.

APPENDIX I

ECONOMIC STATISTICS OF LEWIS (AND HARRIS)

Introduction

•127 THE assessment by the Lewis Association in their first Report
433 on the Economic Position of Lewis (proper) in 1938 shows the income derived from "productive industry". This was defined as that which "produces or tends to produce exchange value", and therefore includes the production of the necessaries of existence by crofting as well as saleable commodities. This estimate covered the tweed industry and agriculture, and touched upon fishing.

434 For the first, the tweed industry, the figures are reliable, and the round total of £140,000 paid in wages to spinners and weavers in 1938 was a remarkable element of the Island income, more than half going to the weavers working at home. Altogether the tweed industry was estimated to provide over £300,000. For the second, agriculture, the current prices for crops and stock, combined with agricultural returns, were sufficiently reliable to give fair confidence in the estimate of production of nearly £200,000 (more precisely, £194,100). For the 3750 crofts an average value was obtained of nearly £50. To this was added the peat cut on the crofts, averaging £24, thought by some to be rather a high value. The work of building and improvement of houses was not included and this has been added, with an estimate of £40,000. For fishing (the third chief source of production mentioned in the Report), the income derived from local boats has here been distinguished from that earned by visiting boats, by combining official statistics with personal, local enquiries. From this fresh analysis a figure of £85,000 is offered here.

(c) House-building. — From 1920 to 1940 the Department of

APPENDIX I

647 Agriculture advanced loans for the erection of 760 new houses
654 and the repair of 220 other houses. This, with the erection
746 or repair of 40 steadings, may be taken as the equivalent of
367 1000 houses in the 20 years of peace, of which three-fourths were new. Rural building was at its height in the early 'thirties,
356 but 1938 was a typical year. Taking the value of each house as £600 and subtracting half for imported materials, we may
431 assume that for 50 houses built that year the labour given produced an output of £15,000. In addition, some house-
362 building and repair was done without State aid, for which a guess of £15,000 may be made. Such sums may not appear
356 large, but they correspond to the enduring fulfilment of a prime
[435] need, a 'real wage', of importance when compared to rents and costs elsewhere. Of the expenditure on house-building in Stornoway burgh during 1938, the value may be assessed as £10,000, of which £9000 was for Local Authority housing. Most of the total was produced by local labour.

(iii) *Fishing Industry—Net Output and Earnings*

434 (*a*) For 1938 the total catches, prices and quantities of
228 fresh cured fish landed in Stornoway District show a value of nearly £100,000 (£98,000) for the herring catch, and of £162,400 for the cured herring. Our problem is to estimate what fraction of these sums may be included in the net output of the Island
• [127] industry proper. The Fishery Board's *Statistical Tables* and *Annual Report* extract the produce brought in by local boats from the total, separating it from that due to 'strangers', and so permitting a fairly reliable estimate, checked by local enquiry.
228 Of the herring taken, nearly 80 per cent were caught in the
• 501 summer fishing, June to August (*Annual Report*, p. 13). The week of maximum local activity in herring fishing for Stornoway District may be taken to be characteristic of this pre-war period (Table 8). There were then 111 steam-boats engaged; and as only five were locally registered (at Stornoway itself), the remaining 106 were strangers. There were also 66 motor-boats engaged and though 81 motor herring-boats are locally

APPENDIX I

228 boats; value, £15,400. Of this, the greater part came into
434 Lewis creeks (Table 17), making £10,000 for Lewis.

Finally, we may add a round figure for whole or part-time occupations associated with the fisheries, including what accrues by the visiting fleet and its business, of, say, £20,000. This gives a total net output approaching £85,000 from fisheries for a typical year just before 1939.

[462] We now turn to an estimate of the earnings of fishermen and of the women engaged in curing. To some extent these figures overlap, for the value of the net output includes the wages of fishermen and women; but the sums earned on 'stranger' vessels—reduced now to some £3000—and the wages earned by women gutters and curers in East Anglia
[436] (about £10,000) are additions to Lewis income. Some of this was, no doubt, sent home in the form of postal orders, etc., causing a further overlap, but much of it was probably sent in the form of notes or brought home in cash. In order to show the real net earnings of rural Lewis, these are separated from the output shown in the first column ((A, i) on p. 314) and are tabled under "Earnings by Crofting and Associated Rural Occupations only" (A, ii).

• [127] (*b*) *Fishers' Earnings.*—As no figures of local earnings are separately published, estimates must be based upon the collation of the Fishery Board's *Annual Statistical Tables* and
[178] accompanying *Annual Reports* with careful local enquiries. By 1938 the fishermen on Stornoway District herring fishing vessels were reduced to about 350 men and boys in the summer season, of whom only a few worked in autumn and winter. Their earnings included the earnings of share owners of boats and of nets, and of those without shares, the latter being only a fraction, say a quarter, of the total. Nearly 100 District men still worked on 'stranger' (East Coast) vessels at the summer fishing and rather fewer at the East Anglia autumn fishing. The sum so earned may have been a third or more of the earnings on District vessels. Altogether the total net earnings from herring fisheries received by all fishermen from Lewis proper came to little more than £8000. By 1938 the

THE MAKING OF THE CROFTING LANDSCAPE

17 All landscapes in these islands have roots in the distant past: Park is no exception. Yet many crofting landscapes have been significantly re-fashioned within the present century after major changes in the nineteenth century. Park does not entirely correspond to the general pattern, and the present cultural landscape has its beginnings in the late seventeenth century, although there are traces of earlier settlement.

Archaeological evidence, in the form of a stone axehead found near Habost, a dun on the brackish Loch Cromore, and a mediaeval chapel on Eilean Calum Cille, provides the earliest
109 record of human settlement in Park. Place-name evidence indicates Norse occupation: the elements
17 'boat', a contraction of the Norse word *bólstaðr* - a homestead, and 'aeir', a shed or bothy situated on pastureland but not regularly lived in, indicate a thin dispersion of farmers practising an extensive and transhumant economy: all the present township names contain Norse elements.

The name Park, is derived from the Gaelic 'A'Phairc' - the park or deer forest: the old name of the district was Oarvaul (Norse: the east mountain). During the eighteenth century, a dyke or turf wall was built between Loch Erisort and Loch Seaforth - 'garadh an tighearna' - the lord of
[142] chiefs' dyke, to enclose the deer forest. Before this enclosure was built, Park was shieling ground used by tenants in Uig (west Lewis):- one of the groups of shielings has the name Airigh Dhomhnaill Chaim and Domhnall Cam was chief of the MacAulays in Uig at the beginning of the
17 seventeenth century. Thus it may well be that after the Norse population left or were absorbed,
538 Park was simply used as summer pasture.
539

It is believed that settlement in what is now the Deer Forest began about 1650. Confirmation of this comes from an unpublished Gaelic song by Archibald MacDonald (An Ciaran Mabeth) composed in Leith soon after 1660. In the song, the author laments the fact that he may never see the Forest again, and says of Park

"'s oil leam caradh na frithe
.....
Bhith fo bhinn aig na bodaich
D'am bu chosnadh cas-chrom."

"I deplore the state of the forest ..... that it should be in subjection to the caries whose livelihood is a cas-chrom" (foot plough - literally crooked spade). The song gives no indication of numbers, and unfortunately no rental of this period is extant.[2]

17 From rentals and other evidence, Park was the last area in Lewis to be colonised in permanent
7 241 settlement: the fact that the population of Lochs parish increased from 912 in 1755 to 1350 in 1801, supports the view that the late eighteenth century saw the extension of modern settlement in Park.

• 127 The first documentary evidence of settlement in the present crofting area is the Judicial Rental of Lewis, taken by the Forfeited Estates Commissioners in 1716. This rental records tacksmen, or major tenants, living in Habost, Seaforthead, and Eilean Calum Cille - all situated along the southern shores of Loch Erisort: there is local tradition that Kershader and Marivig were shielings

1 The editor is indebted to Miss Bridget M. Gordon, B.A., B.Litt. for an analysis and evaluation of the place-name evidence - see Appendix C.

2 For this extremely interesting information and the translation, the editor is indebted to Mr. William Matheson, M.A., of the Department of Celtic, Edinburgh University.

CHAPTER III

SKYE IN THE DAYS OF THE CLAN

If we are to understand the continuing distinctiveness 121
of the contemporary culture, we must attempt to reconstruct the culture of the remote past and point out the plausible sources for the more distinctive traits and patterns which, upon becoming integrated, became characteristic of the culture. This chapter, then, is devoted to a description of the social 128
organization, economics, and religion of the Sgiathanach before the influence of the commercial and rapidly expanding industrial society of Great Britain assumed significant proportions.

Sources of Information

There is an almost complete dearth of information about 127 •
the internal conditions in the Hebrides before the eighteenth century, except for stray accounts of intrigues and rebellions against the Scottish Crown. A combination of causes is responsible. First is the relative lateness of the introduction 127
of writing. Second, there is the fact that the Western Isles 175 *
were held by the Norse from the ninth to the thirteenth century. 212
Third is the destruction of Scottish records. The ecclesiastical

and, perhaps, the legal papers concerning the Hebrides were 127 •
either destroyed by the Norse during their sacking of the 175 *
monasteries or lost upon being transferred to Ireland for safe keeping. Edward I of England, as self-appointed arbiter of conflicting claims to the Scottish throne, and other claimants to the throne at home removed the rest. There is no record earlier than 1140. In fact, except for an Indenture Roll of 1292 and fragments of the Parliamentary Roll of Balliol, 1292-1295, there are no public records earlier than 1308, and Parliamentary records are not available until the Fifteenth Century.

Even when we approach more recent times, caution must be exercised. Shortly before the last Highland rebellion, 1745, an English army officer said about the remote and unfrequented Hebrides, "They are a very proper subject for invention; and few, I think, would have the curiosity to visit them, in order to disprove any account of them, however, romantic"[1] As far as I know, there are only four descriptions of the Isle of Skye which can be dated with certainty before 1700. The first is a brief description by the Dean of the Isles in 1549.[2] The second is a report on manpower and rents

121 maintained. Cohen (1969: 110) relates this emphasis on consensus to role transposability: "...sustained outspoken dissent among members of the network tends to define them as unlike each other and thus to make it difficult for them to substitute for each other in role performance." Allied with intolerance of dissent is the tendency to exclude external influences. Firm boundedness of a network is also indicated by the existence of rites of passage which govern admission to the network, and by the existence of other means by which persons and influences are excluded from the network.

A firmly bounded network competes with subsystems within it. For example, a community which has the characteristics of a firmly bounded system competes with kin groups, marital networks and strong friendships within it. It also competes with larger networks that serve the functions that are the same as those of the community, such as the maintenance of social order and the regulation of change. For example, a strongly bounded local community will conflict with a nation-state (cf. Cohen 1969: 111-117).

121 In the following pages, the sociocultural organization
128 of a rural Scottish township is described, and the changing characteristics of the township as social boundary system are discussed in relation to changing economic circumstances. Chapter 5 concerns the relationship

ACKNOWLEDGMENTS

I have to acknowledge the valuable help of many people in the completion of this book. Some aided by the mere mention of a fruitful source of information. Others, such as the officials of the various Government offices I contacted, went to much trouble to unearth, and present in excellent form, facts and figures not otherwise available to me as a private individual. The *Stornoway Gazette* has been more than helpful in making its files and office facilities available for research. And Mr I. R. MacKay of Inverness did me the kindness of reading through my draft manuscript and commenting on those errors and omissions which would have detracted from the final script. Any mistakes and inconsistencies which remain are to be laid at my door.

/p. 210 is blank/

discovers the strength of community life. And by his renewal of 'racial' experience he may rediscover sides of his own nature untouched by an urban task or a rural holiday. Hence a book such as this inevitably, and I think rightly, contains much that has been felt in a personal way. Yet to offset personal limitations, there is needed objective survey, geographical and social, applied with an open mind and submitted to searching criticism. These two sides, personal and impersonal, I have tried to combine.

The initiation of this work owes much to others, in ways of which they were never to know: to the chieftain, farmer and scholar, James Archibald Campbell of Barbreck, to my brother Alasdair, to my father, Patrick Geddes, who suggested in 1919 to the first Lord Leverhulme that Marcel Hardy, scientist and farmer, should survey the land in Lewis-and-Harris; to Lord Leverhulme, and to Dr. Hardy himself, whom I then assisted. To Mr. T. B. Macaulay, LL.D., was due the suggestion and the plea, made ten years later, that I should bring up to date Dr. Hardy's MS. report.

It was because of Dr. Macaulay's faith in the Island's future and the aid he generously gave to experiments in the reclamation of peat, and also because of the Islanders' own response to his lead, that I accepted this voluntary task. Acceptance, as it proved, was rash. Except for certain valuable findings included under Dr. Hardy's name, a new work had to be written. These circumstances led to the making of the book, stretched over thirty-five years. Certain early hopes recorded here have been frustrated. On the other hand, developments have taken place which few could have foreseen but for their faith in the future of the Island and its people. I trust that in this book the advantages of slow growth outweigh the drawbacks, for time

And region by region, a fairer balance must be struck between country and town. In Lewis, the part of Stornoway town, with its population nearing 5000 (in 1951), is important. Its port, its fisheries, its spinning mills for the crofters' hand-loom weaving, its merchants' shops, and its local, administrative and professional services, are essential to the Island. Its economic and social evolution, too, are interesting. Stornoway's plans for the future are active and ambitious, and these, it is realised, depend upon the prosperity of the 19,000 crofting people of Lewis proper.

But the subject of this book is primarily rural. It is to see with fresh eyes what, from our Harris mountain-top, we viewed as a unit at the core of 'the North and West'. After the island has been described in terms of its physical and human geography (Part One), the endeavour (in Part Two) will be to give a completer account than may yet have been given of the nature of Gaelic community, with its temporal duties and its spiritual sanctions. The three concentric circles of community are described: the family, the farm team and boat's crew, and the larger township groups. The relations of this threefold grouping of livelihood and society to Chiefs and Church are studied, and followed out in later evolution, until today. Elsewhere I have endeavoured to show how the Island can worthily maintain itself, and thereby find a new freedom. The final chapter returns to the broader aspects of society and region touched on here.

If this intensive study of a single isle and community can throw fresh light upon certain essential characters of the less-understood region of the British Isles—that lying outside the south-eastern 'Plain'—it may help to contribute to more than economic reorientation. The significance of the Island life—not so much for the past, which

184 share their characteristics. So to gain a sense o
105 portion from the start, we must map the location o
countrymen, their numerical importance, and thei
128 of grouping. Let us begin with the first of these
102 aspects, their regional location (Fig. 2).

The base map on which the data are plotted sho
102 boundaries dividing the hill masses of the Highlan
Southern Uplands from true 'lowland'. This hill c
13 is mostly covered by rough pasture (left blank on th
311 within which lie strips of 'Isolated Arable' with
improved land in the valleys and along the outlying
lands (shown in black). This hill country includ
Scottish Isles, with the exception of Orkney, whic
241 rather into the category of 'lowland'. It is largely d
to sheep farming and crofting, or left to grouse and
427 The lowland area from the Orkneys to the Tweed an
way is devoted to mixed and dairy farming with lo
types of small-holding, except, of course, for 'Ind
Regions', which include most of the urban area of Sco

226 Within the 'three-mile' territorial limit from the
lie the inshore waters, in which local fishing was
important, and might again become so; these ar
white on the map (Fig. 2). By contrast to their n
extent on the East Coast, their width is notable i
Northern Isles and on the West Coast.

102 The problem set in making this map is to show
13 different worlds, as it were: the Highland and the Low
184 The two are rarely envisaged together, and much con
of thought and policy results. To master the map
128 reader may scrutinise first one part, the Highlands (o
ing the other with one hand), then the other part
182 Lowlands (in the same way): thus each will appear c
in turn. Both can then be envisaged together.

174 The historical aspect of these regional facts is extremely
184 significant to the evolution of Scots social life, and to
179 developments of Presbyterian worship led by Elders in
55 ferm-toun and Kirk; although suggested by comparisons
• 128 throughout this book, they have still to be seriously followed
121 out. As to the future, regrouping of our somewhat
185 scattered agricultural population has been strongly urged in planning for post-war housing and community life. But sound planning must be based on survey, long overdue; though elementary, this key map appears to be the first of its kind for Scotland (Fig. 2). It is from these units of farm-team and township that Scots rural society must be rebuilt, region by region.

184 One further contrast between the farming and the
241 crofting communities demands attention: it lies in the
361 types of migration—one is tempted to say, of semi-
166 nomadism. Crofters, though they move to and from their croft and township—to the city, the sea, or the New World —return home to their native township when they can, and to no other. Many farm servants, on the other hand, though they usually spend their lives in the county or region of their birth, have been on the move from farm to farm, year after year. What is true of Lowland Scotland seems rather true of North-east England, but not of 'the
[164] English Plain'. Unmarried Scots farm servants were hired for the half-year, and frequently moved after each new hiring, the married once a year. Families were annually uprooted—if indeed they could be said to strike root at all!
[122] The war-time 'Standstill' Order for Scotland began to
[178] check this migratory life; but its effects remain. Hence many men have few ties, their wives still fewer. The children could not grow up with their schoolmates: they could look back to no "Auld Lang Syne", of which the

[see p. 16 -- analyst]

114 aborigines in India—lovable people when unspoiled by
174 tyranny, caste or industrial exploitation, as I can testify.[1] Yet Gomme, like many since, leaves the reader with an impression which must be re-examined: that the Islesfolk are the representatives of a backward race who have clung to predominantly superstitious, pre-Christian customs and beliefs. As a people, the Gael received and welcomed Christianity in one of its earliest historic forms, and main-
• [128] tained its spirit through poverty and famine. To this inheritance we shall turn in Chapter VII, when the rhythm of life and its changes have been followed out in the following chapters.

174 To begin with, the briefest outline of historic sequence
613 is all that can be recapitulated, the Island annals having been recorded in the excellent Brand Report (1902), and
[114] by W. C. Mackenzie (1903 to 1937). Politically and strategically, the age of clanship may be thought of as a period of struggle between the Islands and the Mainland
[175] to the south or east. The long-drawn conflict of Clan Campbell of Argyll with Clan Donald—whose Chief was the Lord of the Isles of which Islay and Skye were the two dominant, western keys, and Lewis and Harris the northern outposts—offers a parallel to the conflict of MacKenzie of Kintail with the last MacLeods of Lewis. Obscurity veils the early origins of the Island clans, with their mingled Norse and Gaelic lineage, but chronicles are more reliable by the time of forfeiture of the lordship of the Isles to the Crown in 1493. The MacLeods of Dunvegan, chiefs in north-west Skye, continued to hold Harris until late in the eighteenth century, and they maintained an indirect connection until the nineteenth.

[113] [1] A. Geddes, *Au pays de Tagore: la civilisation rurale du Bengale Occidental*, Paris, 1927.

But the last MacLeods of Lewis, torn by family dissensions, fell fighting before the power of King James VI (and I), who backed the 'capitalist' fishery enterprise of 'the Fife Adventurers'. Although these were routed by the Islanders, a Highland lord and chief, MacKenzie of Kintail, received Lewis from the Crown in 1611, taking his title from Loch Seaforth, near which he had built his Lewis hunting-lodge. Except for a period of forfeiture after 1715, the Seaforth family held the Island until its purchase by a wealthy and beneficent tea merchant, Matheson, in 1844. From Seaforth's tenure and the Papers of the Forfeited Estates are left records of ancient life and of the introduction of changes, temporal and spiritual. These are reviewed in the next five chapters. Chapter X brings the Island story to the year 1953, and its prospects.

a night of black mistiness . . . he waded nearly breast-high" through the dangerous South Ford of Benbecula, "conscious only of the roll and the singing of waters and the rhythm of a poem he had taken down a few hours before"—"The Invocation of the Graces", so nearly lost with him! Much that Carmichael learned was given him under a seal of confidence he never broke, although he mourned the loss this meant. The confidence he inspired—which even those who knew him only in their childhood remember for life—was a source of his quiet, unfailing power.

The following begins with the runes and rites of labour, throughout the day, week and year, on land and sea and at home. Turning to the day of rest and to congregational worship, one must enquire as to the presence of the clergy, and question closely how far the people had access to the Bible throughout the centuries: were they really cut off from its riches, from its essence, as the Reformers and the Evangelicals of last century asserted with such vehemence? One can then turn to the runes and rites which opened the phases of life, from birth to maturity, marriage and parenthood, leading at last to life's close.

But no social inheritance is without its burden. Having told of the foundations of faith, something must be said in the next chapter of the negative or superstitious side of Island belief, of temptations and evils which the people could face, and of others to which they submitted in ignorance. From the evidence of faith and wisdom, or error, one must attempt some evaluation of attainment by single souls and by the community, and of the power and fullness of life in common.

COMMUNITY FROM PAST TO PRESENT PT. II

121 121 only the place but the people are to be understood, respected and helped.

The planning movement is gathering impetus in Britain, as it spreads outwards from bombed towns to countrysides, embracing regions as a whole. It is certainly destruction in war that has stabbed the nation's spirit 'broad awake', awake to features of economic and moral disintegration that preceded actual warfare. The realisation that defeat of the common enemy called for common effort roused the nation to face its enemies of want and confusion at home. Yet the seeds of the planning movement were sown in peace, and only in peace can they grow to fruition. Planning, prepared for by the survey of each region as a whole, must lead towards the freeing of its people not only from physical want but from spiritual frustration. Based on the provision of work and a livelihood for individuals, planning should envisage the common weal and attempt to realise the deepest cravings of each community and serve their highest ideals. In a word, there must be a regional vision of the unity of life.

128 This book began by viewing the 'Outer' Isles as a 18 heart of 'the North and West' of the British Isles, the important of a series of regions extending from the North-west Isles to the landward margin of the English 'Plain'. Differences in landscape and community, in history and modern life, make each of these regions unique in itself; yet—it was suggested—all possess certain features of landscape and evolution in common, which marked them off from the 'Plain' of the South-east. Some four physical and human frontier-lines or border-zones divide these regions. South-eastward from the Minch four were selected: the Highland Line, the Scottish Border, the edge of the older rocks of Britain and,

CH. XI

CONCLUSION

128 enclosing all, the zone from Severn to Tees. Having por-
18 trayed the environment and life of the Isles—'innermost' of the regional series, the next step was to extend this survey beyond the Minch to the Highlands and Isles as a whole, and then to compare these with the regions extending south-eastward—' outwards '—from the Isles to the margin of the ' Plain ', through the regional series we group as ' the North-and-West '.

121 Two main tasks lie before us in making comprehensive community surveys, once the geographical basis is established. The first task, historical in method, is the reliscovery of cultural foundations. These might be compared (as we said at the outset) to the Archaean gneiss laid bare only in the North-west, but still the foundation, albeit a hidden one, of the ice-sculptured rocks of Highland Britain, from the pre-Cambrian to the coal at the margin of the overlying, differently sculptured rocks of the ' Plain '. Understanding of the past can help us to understand not only the evidence of the present, but latent, underlying powers. Regional traditions, dormant for one, perhaps for many generations, may germinate afresh if we can understand the conditions in which they once grew and also those needed to awaken them to new life in finer forms.

The other task of social survey must be to recognise the common efforts of the present, with eyes undimmed by prejudices of class or culture, grasp the relation of personal efficiency and self-realisation to life in teams or groups. The inherent cultural interests of the people of each region in work and leisure must be evaluated. Underlying actual achievements, latent powers may be discovered which must be freed for communal attainment. Better work under better conditions should bring about the flowering of personality in harmonious communities.

St Geddes K-4,5 (1919-1952) 1955 ES10 Highland Scots Lewis and Harris

APPENDIX I

128 An effort has been made to separate crofting from other in-
433 come, and also to average the income from the sources given of
20 the total rural households, numbering 200, comprised from
20 the 3650 *occupied* crofts plus an estimated 1050 others, namely,
cottars and squatters, and ' feuars '—*i.e.* holding land in feu.

431 Finally, to the production income earned on the Island there should be added that received by earnings sent or brought home to dependants, together with pensions, unemployment relief and the like. I am greatly indebted to the appropriate officials for the figures cited for 1937–38 or the year immediately preceding. These sources average £45 per rural household. 128 The figures tabulated all apply to Lewis alone; but many figures having been obtained for Harris also, conclusions are similar there. The concluding Table (pp. 314-315) bears a note on other sources of income, with a similar table for 1953.

(i) *Tweed Industry*

128 After deducting the cost of wool imported from the main-
421 land and certain other costs, the net productive income was
260 taken to be £300,000. The estimate may still err on the high side but it indicates the prime importance of the industry in the Lews. For 1938 the quantity of tweed stamped, and certified as hand-woven by the Harris Tweed Association Ltd., was 2,830,000 yards imperial yard, rising in 1939 and 1940 to 4,000,000 yards, though falling thereafter. The value of the tweed produced in 1938 was approximately £500,000. The total wages paid in 1938 amounted to £140,000 (£139,000), rather more than half of which was paid to the weavers working at home. In 1940 this had risen to nearly £200,000, a slightly higher proportion falling to the weavers.

365 In addition to the wages paid and the price paid for local
651 wool, the industry is a valuable customer of the Electricity Com-
458 pany and directly or indirectly provides much other employment in the Island. The industry also provided a market for a large quantity of Scottish wool and contributed to taxation.

The productivity and earnings of the industry continued to

St Geddes K-4,5 (1919-1952) 1955 ES10 Highland Scots Lewis and Harris

APPENDIX II

RECENT STATISTICS (1933–54)

128 In brief form, the basic economic data can now be reviewed,
433 in the same order, for 1933–38, the period April 1939 to 31 Dec.
20 1954, as available. The results are shown on the second pair
431 of Tables, pp. 318-319.

(i) *Tweed Industry* (1933–54)

431 Taking 3,000,000 yards as the 1933–34 total, and accepting
an estimate of 1s. 2d. paid to weavers per finished, mill-shrunk
288 yard, payments to weavers in Lewis-and-Harris (and a few in
463 the southern Hebrides) would amount to some £891,700. After subtracting the output from Harris, this corresponds to an informal estimate by the Lewis Association for Lewis proper of well over £250,000 and more, probably £275,000 for the period. Adding the wages of spinners in Stornoway mills, and also of carriers, dockers, etc., it is thought safe to double the figure, with £550,000, for Lewis, rural and urban. Most of the weaving is rural. The increased use of daily bus transport allows rural dwellers to come to Stornoway daily to earn and so has increased the ratio of rural to urban wages by spinning and other labour. For rural carriers and mill-employees, a fifth of £275,000 is taken here, making £55,000. As an estimate of the ' net earnings ' in Lewis is available, the same ratio to wages is taken as in 1938, making £1,200,000.

(ii) *Agriculture, Peat-making and House Building* (1953)

128 (a) *Agriculture.*—First, the trend of crop and stock pro-
431 duction can be indicated by selected figures for the Island for
741 1938, 1939 and 1953. The areas both of oats and rotation grass increased, the three successive totals in acres being, for oats: 4460, 5020, 5440; and for rotation grass: 390, 1385,

4: Moisley et al. K-5 (1959) 1962 ES10 Highland Scots ES10 Uig

DUN CARLOWAY

361 Dun Carloway though clearly of a similar type to the other township south of Loch
Carloway has certain features peculiar to itself. The croft land may be divided into
927 two sections: crofts 18 to 25 occupy the deep trench which extends from the Dun Carloway
Hotel to the Loch, and the remainder occupy the slopes of the hill to the south-east.
Soil and rock are divided in broad rectangular bands. The former is the more deeply
entrenched zone where the crofts are long and narrow lying up and down slope like those
of Borrowston. Short steep and narrow lays help both characterise the cultivation which
differs little from that in other townships, although the areas, as has been noted
above, are smaller than in most other townships. Cultivation is more intensive than
this increased size on croft has more than ten acres of oats. The low percentage of
land under cultivation is only in part explained by the difficult nature of the ground and
the limited area which can be made of the cultivable land. Some are willing to attempt
enterprise so long as the income from weaving is satisfactory, but when this
fails they are not equipped to do much other than subsist. Moreover, with this
population at its present level, and with the income from weaving so it is, very few
crofters are prepared to do much more than subsist. Some, of course, have to carry out
difficult and tedious work, and yet they can only earn the minimum wage. The annual call so be produced and to
derive what income Providence rather than predetermined management may allow from the sheep.

427 The total area of individually held crofland is 194 acres which is worked in twenty
311 crofts, the average croft being nearly six crofts, the average croft being 9.7 acres. Of this
311 land approximately 100 acres are cultivated, accomplished by our horse and our tractor, each
in which is owned within the township.

The total running is exceeded, the main causes for this being the gross overstocking
311 of sheep, the lack of fertilizer, the poor quality of the cultivable land, and the lack of
the crofland itself, under-cultivation and disease. The poor quality of the hill
pasture is illustrated by a comparison with the grazings of South Uist where the most
striking feature of the landscape is its greenness after the heavier browse of Western
Lewis. Regeneration by surface seeding would certainly be helpful here.

R.A. Moisley.

SUMMARY AND CONCLUSIONS

128 The figures given in appendices C and D form the basis for much of the comment in the
431 following pages. They serve to underline the great gulf between the good natural resources
which they illustrate in the changing livestock economy units.

(a) Appendix C(1) elucidates the working of the crofts. The picture is somewhat com-
431 plicated by the large number of non-crofting holdings in the area, of which 43 carry
431 with it quotas of these upland crofland lays. The number of lays are tenuously in the
431 process of being increased, and the number of crofts with lays of more than 10 acres
431 been taking place for some time. There are in this connection one or two cases of the
431 of cross-croft lays, a practice unknown in the neighbouring townships. The figures for
431 these units have been included with those of the township where the tenant is resident.

340 Crofts are the most important arable crop. Yet, as regards the grass for hay and
pasture are much lower in comparison. Permanent grass, mostly old arable land, is
in no found on 55% of the total area of land occupied in crofts and feus. A large propor-
tion of this is on very thin soil where bare rock is exposed and on wet land, but even so
the area of good land is not large and it is difficult to do anything about improving it.
The decrease in the number of cattle and sheep in the crofting township is not large
that for the Valine area of South Uig where about 70% of the sheep and cattle are

4: Moisley et al. K-5 (1959) 1962 ES10 Highland Scots ES10 Uig

permanent grass. The pre-eminence of the Carloway area is then only a relative one
where the decline in cultivation is taking place at a slower rate. Isolation, the decline in
fishing and the lack of alternative employment tending to a greater decline in population
may explain the more rapid decline in the Valine area. Whether Carloway will see a
similar decline remains to be seen.

Table 35

Carloway district as a proportion of total acres of each township - Carloway district, August, 1959

TOWNSHIP	All Stock	Cattle	Sheep*
Carloway	63%	53%	76%
Carloway Park	87%	64%	119%
Borrowston	74%	15%	111%
Garenin	97%	39%	169%
Knock Carloway	64%	39%	90%
Gravirig	73%	21%	136%
Dun Carloway	104%	21%	187%

* As recorded in some cases these figures are too low (see Appendix C (2)): the maximum error is probably around 10%.

128 Table 35 summarises the agricultural system; further details of the relations between
431 value of unit, status of tenant, stock of cultivation, will be found in Appendix C (1), (2), (3)
431 and (4). Though the total acreages that is the conversion of both cattle and sheep units
431 into 'new units' expressed as a percentage of the average never fall below 100 the actual
431 stocking is exceeded in five townships and that grossly in two cases. Once again however
431 the figures for Valine and Knock Carloway are not representative of the township as a
431 whole since the figure for Valine. Not does the mere statistical analysis reveal all for
431 picture for it is essential that a proportionate number of cattle be kept so that the grazing
431 of both cattle and sheep may be adequate the growth of the grass. As it is, the relative and
431 absolute increases in the numbers of sheep is having a serious effect on the quality of the
431 pasture.

Sheep are given less attention that the cattle whether they need it or not and few of the
431 crofters are willing to undertake the life of the shielding in the hills of the Forest where
431 the sheep are left to fend for themselves. Lambing is now arranged so that most ewes are
431 most entirely given up to sheep. The shielings are now the property of the crofters and
431 consequently are more close at hand and are used for a much shorter period of grazing than
431 the shielings of the hill landscape has already been mentioned.

Comparison of the totals given in Appendix C (1) shows how the present pattern is unsatis-
431 ping. 187 milk cows are being raised on 177 agricultural units and with these are 113
calves. Appendix C (3) and C (5) indicate that the agricultural unit farming the basis
of farming is the single milk cow and annual calf which carries a subsidy if it passes the
grade test set by the Department of Agriculture. A few crofters are raising young beasts for
sale but for most the cow is the only cattle beast on the croft. The cow is a valuable asset
certain market which can be affected at any moment by an increase in transport costs
which are already very high. Moreover the subsidy such enterprise would barely pay
at all and indeed one could say this of many aspects of life in the island today. Some of
the calves are whitened, but the usual practice is to sell off late in the year.

4: Moisley et al. K-5 (1959) 1962 ES10 Highland Scots Uig

APPENDIX C continued

(f) Additional data relating to township sheep stocks, August 1959

TOWNSHIP:	TOTAL STOCK (including lambs)		LAMBING		STOCKING RATIO (per 100 acres of grazing, summer)

Kirivick	680	550	796	15	15	
Knock Carloway	848	950	746	70	29	
Carloway (including C.Park)	944	1,000	816	42	28	
Borrowston	467	550	356	15	15	
Garenin	957	1,000	676	35	19	

128 NOTES: (a) The last two columns cannot be directly compared because the sheep
431 case per 100 acres of summer grazing does not include lambs.

(b) Acreages have been calculated according to the rent equivalent as
the date. For similar reasons the rent equivalent has been used unless some
other rent is specifically quoted in the regulations.

TABLE 37

The Crofting Structure Re-organised

(a) Holdings

District	Proportion of holdings grouped according to size of intake (acres)				All holdings
	0 - 5 acres	5 - 10 acres	10 - 50 acres		
North Uig	238	38%	15%	15%	100% (105)
Bennaven	148	27%	19%	10%	100% (105)
East Loch Snug	158	30%	16%	9%	100% (105)
Carloway	178	29%	19%	5%	100% (105)
WHOLE PARISH	30%	30%	16%		100% (105)

Note: These are the registered crofts and similar agricultural tenancies as at the 1961 valuation roll. About 50 holdings omitted for lack of data.

(b) Effective agricultural units

District	Proportion of units grouped according to size of intake (acres)				All units
	0 - 5 acres	5 - 10 acres	10 - 50 acres		
North Uig	19%	16%	15%	10%	100% (105)
Bennaven	13%	30%	16%	10%	100% (105)
East Loch Snug	19%	16%	16%	10%	100% (105)
Carloway	21%	30%	16%	10%	100% (105)
WHOLE PARISH	30%	30%	16%		100% (105)

Note: About 30 units omitted for lack of data.

(c) Summer Grazings (Sheiling, sea ware)

	Proportion of holdings (numerically registered crofts)	Proportion of effective agricultural units
Under 2 acres	18%	47%
2 acres and over	82%	53%
All holdings/units	100% (105)	100% (105)

Note: The Carloway district is here excluded because about 50 small in Uig agricultural units without crofter status obtained summer grazings in the 1960 (Sheiling) Ordnance Survey Map.

Sources: Appendices a(2) and (4) and (5) and (6).

Lochmor - Who are the patriotmicrofarm ?

When we recall (Table 13, page 28) that 14% of the crofter tenants are absentees, that 30% are out of years of age but under 65 and are not, and that a further 7% are women under the age of 65, it becomes clear that many of the tenants cannot, or do not, or are not allowed to, or are not encouraged to, or are not expected to, or are not wanted to, or are not able to, or are not willing to, or are not interested in, or are not concerned with, extra resource because it was necessary to decide for every crofter what must be included in the 'crofting' and what must be left out. Nevertheless, in some cases croft work is related to a livelihood and a social structure which is not entirely crofting. Some cases are available for the Barnsley work, which the Ordnance Survey Map (after revision) not being available for the Barnsley work, which the Ordnance Survey Map (after revision) not being available for the Barnsley work, which the Ordnance Survey Map (after revision) not being

by a second cousin. The striking thing to realize here is that the nearest surviving relative always knows his obligation and is ready to fulfill it, without question. Fatherless children are buried by either their paternal or maternal uncle. I have not forgotten the existence of women. The simple fact is, women play no part as mourners. Indeed, the rare woman who goes to the grave becomes the subject of lasting gossip.

Fundamentally, the system of kinship is patrilineal. Linguistically, the terms for relatives may be bilateral, and inheritance of possessions other than the name may be matters of small importance, but the patrilineal emphasis remains. The Sgiathanach lives in a man's world. I shall explore this male dominance further in the following chapter. At present, I want to briefly discuss two additional cliques.

Religious and Age-Grade Cliques. Like the members of any society, the Sgiathanach associates most frequently with those who share his interests and attitudes. It is natural, then, for his associates, other than his kinsmen, to be people who attend his church and people of his own age group. We need not explore the nature of these cliques at this time; but we should have some understanding of their function. The religious clique is primarily a mutual aid group. There is reason to believe that this particular group has lost much of its importance of late, with the coming of the welfare state. Many feel that the government pays people to look after the aged and infirm. As far as doing a favor for someone is concerned, few of the same kirk, other than close friends,

304

crofters, an individual's prestige depends more on what he does for the group than on occupation.

The society has a strong degree of integration. This is shown by the requirement of unanimous consent on all undertakings, even in the village, and by the continued success of the group in exercising social control by positive concerted action and by employing gossip as a negative social sanction. The norms of behavior and the values have remained common and clear.

We are now closer to an understanding of how the Sgiathanach has maintained a continuity. For a full understanding of the social organization and to answer the question why there has been continuity we must take one final step. The religious aspect of the culture holds the key to the unanswered questions.

307

The religion of the Sgiathanach may also be regarded as the logical outcome of a movement which began two centuries ago when the all inclusive bonds of kinship and affection were replaced with tenets introduced from the wider contractual society. This movement, as we know, bore its first fruits over a hundred years ago. The people themselves turned from the ministers who were supporting symbols and values no longer meaningful to the crofters. They embraced the preachers of a dynamic gospel as a means of consolation in their distress. Thus, the religious pattern derived elsewhere and superimposed on the Sgiathanach has been refined with logic and vigor. It has become the one insurmountable barrier to assimilation with Great Britain. No less than four times religious schism has demonstrated the essential unchangeableness of their religion. The process has been carried on with such dedication and success that it now disturbs the unsympathetic laity and the clergy of the Church of Scotland no less than the resistance of the people to Presbyterianism did in the remote past.

We saw in Chapter IV how an understanding of the religious history of Skye is indispensible for the comprehension of the larger problem, the means by which the culture has maintained continuity. In Chapter V and again in Chapter VI we saw how this continuity has been preserved. We have at last come to the point at which we can ask why has there been continuity. The following analysis is concerned with the sanctions of the Presbyterian ethic, particularly as it affects the social structure, religious behavior, and the roles of the ministers and the religious laity in the

contemporary scene. Assuming that few of my readers know any more about the nature of the religion of the Sgiathanach than I did when my wife and I first set foot on Skye, I shall begin with a brief description of formal organization and theology.

Formal Organization and Theology

The Isle of Skye now has four independent Presbyterian Churches, the Church of Scotland which is the official state church, the Free Church of Scotland, The Free Presbyterian Church, and the United Free Church. There are, in addition, a few Catholics, including the one family of the county people who worship by themselves and several government employees in Portree who meet together and hold services in a private chapel. There is also a fairly large number of Episcopals, consisting exclusively of county families and newcomers, who periodically receive a visit from a minister in Fort William but who otherwise attend the services held in the Church of Scotland.

The Presbyterian Churches differ from one another in several fundamental details of their constitution, doctrine, creed, and practice. All claim to be in historic continuity with the Church of Scotland which was reformed in 1560, the liberties of which were ratified in 1592 by the Scottish Parliament, and the security of which was recognized in the Treaty of 1707. All, except the United Free Church, hold to the principle of national recognition of religion,

asceticism is fundamental to the peoples' lives. A brief discussion of the Sabbath will serve to conclude my discussion of religion and to indicate some additional difficulties which the Sgiathanach faces in his attempt to preserve his culture.

Sunday does not exist on Skye. There is the "Continental Sunday" and the Sabbath. On any other day of the week, the greeting is, "It's a fine day," or, more often, "It's a wet day." The Sabbath, however, is "no day to be speaking of days." Keeping the Sabbath is almost a fetish among the people. It is a readily observable test of an individual's religious capacity. All unnecessary work, all unnecessary words, and all unnecessary thought is taboo. Only the barest minimum of worldly activities are permissible. This does not mean a day spent in idleness; the time should be spent in public worship at the kirk, private spiritual contemplation and family worship. The Skyeman's estimation of a newcomer may depend on his keeping the Sabbath. One man was very surprised to learn how long a memory the people have when a man deviates from the expected. A visitor asked a crofter what kind of a man a certain newcomer to Kilmuir was, to which the crofter replied, "He's all right, except six years ago he played the pipes on the Sabbath." Most newcomers, including the few Catholics, respect the Sabbath.

No crofter would ever think of doing any work on this day beyond feeding his cattle as an act of mercy. After weeks of rain, the crop of oats or hay may be ready for harvesting on the Sabbath, but he will not touch it. A man

CHAPTER VIII

SUMMARY AND CONCLUSIONS

My intention in writing this present study has been to inquire whether or not marked population growth and decline is a criterion of cultural discontinuity. To this end we have spanned more than two centuries of the culture history of the Isle of Skye. As we proceeded from a description of the configuration of the culture as it was in the days of the clan, to a narration of the perpetuations and modifications of the content of the culture during four periods of the modern epoch, and finally to an account of the contemporary culture, we have been constantly aware of the swing of the population pendulum. Throughout this study I have attempted to analyze the available facts for evidence which would indicate not only cultural but also social disintegration. In this final chapter I shall draw the sundry threads of my running commentary together to support the aforesaid conclusion that population change is not a criterion of cultural discontinuity.

The Population Cycle

In as much as my purpose is to evaluate cultural continuity within the framework of population change, let me first briefly review the changing size and structure of the population.

3: Geddes K-4, 5 (1919-1952) 1955 ES10 Highland Scots
Lewis and Harris

share their characteristics. So to gain a sense of proportion from the start, we must map the location of Scots countrymen, their numerical importance, and their types of grouping. Let us begin with the first of these three aspects, their regional location (Fig. 2).

The base map on which the data are plotted shows the boundaries dividing the hill masses of the Highlands and Southern Uplands from true 'lowland'. This hill country is mostly covered by rough pasture (left blank on the map) within which lie strips of 'Isolated Arable' with other improved land in the valleys and along the outlying coastlands (shown in black). This hill country includes the Scottish Isles, with the exception of Orkney, which falls rather into the category of 'lowland'. It is largely devoted to sheep farming and crofting, or left to grouse and deer. The lowland area from the Orkneys to the Tweed and Solway is devoted to mixed and dairy farming with lowland types of small-holding, except, of course, for 'Industrial Regions', which include most of the urban area of Scotland.

Within the 'three-mile' territorial limit from the coast lie the inshore waters, in which local fishing was once important, and might again become so; these are left white on the map (Fig. 2). By contrast to their narrow extent on the East Coast, their width is notable in the Northern Isles and on the West Coast.

The problem set in making this map is to show two different worlds, as it were: the Highland and the Lowland. The two are rarely envisaged together, and much confusion of thought and policy results. To master the map, the reader may scrutinise first one part, the Highlands (covering the other with one hand), then the other part, the Lowlands (in the same way): thus each will appear clearly in turn. Both can then be envisaged together.

Chart of Positions of End Map
[Facing End Map]

drawn up for the Crown sometime between 1577 and 1595.[3] In 1630 a short commentary on the social, religious, and economic life of Skye was penned.[4] Finally, at the close of the century a native son wrote the first detailed account of life on the island.[5] Thus, I have had to rely on stray fragments, gleaned from such material as can be found, and on later works. This is a handicap which may leave my interpretation open to criticism, but the statements of these authorities have been used to fill out the details of an established pattern only when their accounts are beyond reasonable doubt.

The Bare Bones of History

Although the Archaeological record for the Isle of Skye can be traced back as far as 2000 B.C., when Neolithic man became the island's first inhabitant, the evidence suggests a series of invasions and withdrawals by people at varying stages of development rather than a continuous local development.[6] Indeed, no one has uncovered any evidence for settlement between the fourth and seventh centuries. At the same

and for each head of cattle, some forty-five acres.

The crops are not only limited in acreage but also in variety. Since there were less than ten acres of barley, which was cut green for silage, it may be said that the only grain is oats. The yield of the 2292 acres of oats was a low twenty-nine bushels per acre. The variety grown (Sandy) is not a threshing oat. It is fed to the cattle in the sheaf. This, of course, means seed oats must be purchased in the spring. The only other crops of any importance were 587 acres of potatoes and 99 acres of turnips. The yield for potatoes was about five tons per acre and for turnips, fourteen tons per acre. These yields do not satisfy the needs of the Skyeman and his cattle. The hay was poor in both bulk and quality.

It will be seen from the preceding discussion that the livestock industry is the basic factor in the economy. The production of crops is of no more than limited secondary importance. Let us now look at the value of the agricultural production on Skye in terms of locally consumed produce and exports. The following figures represent a collation of facts and figures generously provided by the Department of Agriculture for Scotland, the North of Scotland Agricultural College, and local officers of these bodies. For brevity, I have set them out in Table 2.

the economy by subjecting many fertile acres to disuse because of his infirmity. The other factor is the absentee tenant, an individual who has obtained possession of a croft, normally by inheritance, but who has failed to take up his inalienable rights of tenancy. Let us very briefly review the economic trends of the last fifty odd years and, then, try to assess the importance of the absent and the aged.

Although the Sgiathanach has refused to become a specialist, fully involved in a money economy, he has become increasingly dependent on the products of the wider commercial society. Long ago he gave up growing the old staples, barley and oats. Not for many years has he grown enough potatoes or turnips to feed himself and his cattle. In place of these home grown subsistence crops, he now imports a great deal of his food. In an average year Skye imports over 700 tons of bread, 10 tons of vegetables, 300 tons of canned goods, 300 tons of potatoes, 500 tons of flour, and 100 tons of milk. To pay for these products, he exports cattle, once his only marketable produce, and an ever increasing number of sheep.

Hance, writing about the Outer Hebrides, sees the growing tendency of the crofters to buy their food as indicative of an increasing cash income.[16] To a certain extent, this may be true. There are, however, additional factors involved. Ecological limitations have played their role. That the climate and soil together make Skye a grassland suitable for stock breeding rather than an island fit for cultivation is an often repeated

[16] Hance, The Outer Hebrides in Relation to Highland Depopulation, p. 22.

Something has to be done to keep the people here." A Glendale crofter put it more forcibly: "There aren't enough men in Glendale to man a row boat. They've lost experience. One crew after the last war lost their boat because they didn't know how to use it. If depopulation isn't stopped, there soon will be no need for any of these remedies." Fishing, then, is one of those subjects which is often discussed and about which little is done. Let us turn to a consideration of the less traditional occupations open to the men of Skye and their womenfolk.

Minor Supplementary Industries

Diatomite. Diatomite, the siliceous remains of minute organisms laid down in fresh water lake beds, is found in quantity in drained Loch Cuithir, near Staffin. After extracting, drying, and pulverizing, during which process it loses 70 percent of its weight, it has innumerable industrial uses, ranging from filters for the manufacture of beer, sugar, fruit juices, and petroleum products, through abrasives, to fillers and insulation material. Attempts to work this large and high quality deposit go back seventy years. To date, however, the success has been indifferent. The omnipresent lack of capital, difficult access through rugged terrain, and technological barriers have been limiting factors. Within the last few years outside investment, about £180,000, with a limited amount of local capital has stimulated the industry once again. A road was built by the government to replace the old tramway, long in disrepair and

adjustment to the higher society in which the successful individual is the specialist. The Sgiathanach has remained a pastoral-agriculturalist, and when he does seek employment, it is typically as an unskilled laborer.

It is far easier to point out the traits and trait-complexes he has lost than those which he has accepted during the two hundred years since 1745. The sad economic condition under which he labors is not conclusive evidence for disorganization. Integration does not mean smooth functioning. Nor do the changes, important as they are, point to discontinuity. The contemporary economic system reveals a fundamental continuity. As I remarked at the beginning of this chapter, there is something far deeper involved than economic considerations. Let us now turn to the social aspect of the culture in order to seek an answer to the question why has the Sgiathanach remained in the face of all the inadequacies and insufficiencies we have reviewed.

CHAPTER VI

THE ISLANDERS' SOCIETY

The Units of Social Organization

621 632 571 121 128 Since the Sgiathanach has consistently been more bound to his locality groups than the relatively mobile members of the main stream of Western Society, I think that we shall find a pause to review the character of the social systems which are primarily based on territoriality a valuable aid to our understanding of how cultural continuity has been preserved. By now we are all well aware of the fact that the township is the efficient economic unit. It is also a social entity. The members of each township display a consciousness of common interest, symbolized by the communal hill grazing; and their inter-personal relationships, reflecting ties of kinship and friendship, reveal a rate of interaction second only to those of the crofting family. In most of the townships, the people are related and re-related on both sides 361 by descent and marriage. Laid out along the coast or in a fertile glen, with the cottages on the individual crofts, it has a discernible form. The township is a small cluster of five to twenty homes; approximately an equal number of garden-like farms, stretching out behind the houses; and,

CHAPTER III

SKYE IN THE DAYS OF THE CLAN

f we are to understand the continuing distinctiveness 121
contemporary culture, we must attempt to reconstruct
ture of the remote past and point out the plausible
for the more distinctive traits and patterns which,
coming integrated, became characteristic of the culture.
apter, then, is devoted to a description of the social 128
ation, economics, and religion of the Sgiathanach
the influence of the commercial and rapidly expanding
ial society of Great Britain assumed significant
ions.

Sources of Information

There is an almost complete dearth of information about 127
ternal conditions in the Hebrides before the eighteenth
, except for stray accounts of intrigues and rebellions
the Scottish Crown. A combination of causes is re-
ble. First is the relative lateness of the introduction 127
ting. Second, there is the fact that the Western Isles 175
[213]
eld by the Norse from the ninth to the thirteenth century.
is the destruction of Scottish records. The ecclesiastical

Map A

The Seven Crofting Counties of Scotland

634 The Outer Hebrides, a chain of islands over a
• 131 hundred miles long which lie to the northwest of the Scottish mainland, are part of "Ross and Cromarty" and "Inverness," two of the seven crofting counties of Scotland (see Map A). The seven crofting counties
108 (Argyll, Inverness, Ross and Cromarty, Sutherland, Caithness, Orkney and Shetland) constitute the scenically beautiful but agriculturally marginal land often referred to as the Highlands and Islands of Scotland.
101 The word "Highland" also refers to features of social
197 life such as crofting tenure, strong community feeling and Gaelic-speaking which are characteristic of many communities in both the Highlands and Islands as well as in cities such as Glasgow in which persons from the Highlands and Islands have settled. For example, a Gaelic speaker whose parents came from the Islands and settled in Glasgow may be called a "Glasgow Highlander." The first four crofting counties listed above have a large percentage of Gaelic speakers. In the national
162 census of 1961, 82.3% of the 32,607 inhabitants of the Outer Hebrides were Gaelic speakers.

131 Lewis and Harris, a single body of land which is
133 sometimes referred to as two islands because the mountainous southern section called Harris differs markedly from the flat, northern moorland of Lewis, is the northermost island in the Outer Hebrides (see Map B).

000 in the northermost island in the Outer Hebrides (see
161 Map B). The population is concentrated along the
162 coast, like a hat-brim around the great inner core
361 of the island's heather-covered bogland, a population belt classified as "dense rural" (50-400 persons per
226 square mile) in a map based on the 1951 census. The pattern of land settlement reflects the importance of fishing in the economy of the island.

• 131 Lewis lies between 6°10' and 7°20' west longitude, and between 47°50' and 58°30' north latitude. Lewis
131 is as far north as Newfoundland and farther north than
132 Mongolia, but the temperature is mild because of the North Atlantic Drift, or Gulf Stream, which passes the
132 west coast of Scotland. The temperature averages 55°F. in summer, and 44°F. in January. A constant climatic feature of life on the treeless island is the wind, a relentless, insidious presence which often reaches gale force. Winds of 60 m.p.h. and more are common.

Rain, which comes in downpours or light mist,
133 averages 55 to 65 inches per year. The water may be held in colloidal suspension with decomposed organic matter in the compact, spongy material called peat, or pour as rivers and streams off the island's shelf of
131 non-porous Archaean gneiss into the sea. Of Lewis'
133 total area of 437,200 acres, inland water comprises 24,863 acres.

• 131 Lewis is about 40 miles long. The distance from Stornoway to the west side of the island is about 15
361 miles. Along a tar-macadam road through Barvas parish
491 from its northeast tip toward the southwest, about 18 villages are clustered along a relatively flat coast for as many miles until the land becomes hilly. The road then narrows and takes hairpin twists around blind,
361 stony corners. Villages become fewer, and nestle in protected coves or string haphazardly across the face of the hills.

Shawbost (from the Norse sjö or sjo meaning "sea"
632 and bost or bolstadhr meaning "dwelling" or "homestead"), a village in the parish of Barvas, lies on three low hills on the west coast. Shawbost is 18 miles from Stornoway on a circular route in which Stornoway and Shawbost are antipodes.

172 On the south side of Shawbost bay, huddled beside the sea strand, is a cluster of ruins called Sean Bhaile (the old village), believed to have been occupied over 200 years ago when fishing was important in the local
348 economy. Banks of the streams are dotted with the ruins of old grinding mills and ovens for drying grain.
312 Fresh-water springs are still kept clear of rushes, although water is now piped to most houses from a nearby
000 loch. Hundreds of place names are known to the villagers

182 government bodies and industries in cities on the mainland, rather than being relatively self-sufficient as it was at a previous time. The periodic return of
166 relatives to the island reflects this peripherulness,
181 as do feelings of inferiority among the islands. The island has become not only geographically but socially marginal.

A. Geographical Marginality

Geographical marginality refers to the distance of
121 the islanders from various economic and administrative
• 131 centers on which they depend. Because they are distant,
182 they are more likely to suffer breaks in channels of communication with these centers, as when storms prevent boats from docking. They are "marginal" because they depend on central sources rather than being self-contained; and the difficulties entailed in this marginality encourage the retention of techniques and patterns of interaction derived from the days of relative self-sufficiency. The anomalous combinations of old and new found in the township may be attributed to such marginality.

121 A "strategy" may be thought of as a pattern of behavior which develops in a particular history of reinforcement, the parameters of this reinforcement

Chapter 7

Conclusions:

Summary and Theoretical Considerations

A. Summary

105 Crofting townships of the Highlands and Islands of
• 131 Scotland are within a few hours' travel of the major cities
140 of Britain. An extremely high percentage of the young
173 people in the crofting counties attend universities and other institutions of higher education. Politically,
641 administratively, economically and in other ways, the crofting population participates in the larger urban-industrial society of Britain.

105 Despite this participation, the township-qua-village-
232 community is a relatively strongly bounded system. This
621 thesis investigates factors contributing to the strong
124 boundedness. From a relatively self-sufficient economic
105 unit using agricultural practices suited to the extensive
175 cultivation of marginal land by smallholders, the township
632 has during recent decades changed to one dependent on
241 goods and services provided by the larger society.

105 Crofting activities nevertheless persist, in part because
241 of the incentives offered by government bodies such as the
654 Crofters Commission and the Department of Agriculture. The

1 INTRODUCTION

• 131 THOUGH generally referred to as separate islands, Harris and Lewis are geographically speaking one island—the largest landmass in the Outer Hebrides. Its latitude is approximately 57° 40' to 58° 40' N; its longitude 6° to 7° W. Many have expressed surprise at the size of the island, which is over 800 square miles in extent. From top to bottom the crow's flight distance is just over 80 miles, and from east to west about 14 miles. By road, however, the north-south journey (the Butt of Lewis to Rodel in Harris) is a good 80 miles. And by road from east to west (Tiumpan Head lighthouse to Breinish in Uig) is 54 miles.

132 Among the oldest islands of the world Harris and Lewis is
135 founded, like a strong resisting house, on rock, on gneiss said to be the oldest fragment of Europe. From a distance the tough durable Lewisian gneiss is easily recognizable as bare, barren, elongated domes and ridges, giving a hummocky appearance to the landscape. Among other rock types to be found is a patch of a few hundred acres of granite in the parish of Barvas, on the west side of Lewis; some torridonian sandstone showing on each side of Broad Bay, around Stornoway; and the tertiary basalt of the Shiant Isles. These latter islands, pin-points of high land, are geologically speaking insular outliers of Skye, though they are but a few miles or so off the Lewis coastline. Another set of islands, associated with Harris and Lewis, are the St Kildas, composed of gabbros and basalt.

The continual exposure of the rocks on the island makes it easy for those interested in geology to see just what happened those countless years ago. Sands, muds and limestones were formed in an ancient sea, to be later heated and recrystallised as volcanic eruptions occurred. During this boiling, a seasoning touch of molten granite was added. Later, still in an ancient season, the rocks were thrust up and crushed against each other to form today's geological spectacular. Dark-coloured hornblende and

INTRODUCTION

ing thieves, patches of heather, deer-grasses or moorland plants 133
live as they can on thin layers of peaty soil. To relieve the hard 135
scenery there are, on sunny days, glintings of water, lochs or rivers 137
flowing uneasily over beds of primordial rock.

Area (in acres) 131 133

PEAT AND RIVERS

The peat overlays of the island are reckoned to be not much 134
more than 7,000 years old. The largest bed, which is figure, when the
megalithic circle of Callernish, on the west of Lewis, was excavated 172
by Sir James Matheson in 1857-8, a depth of 5 ft of peat was
removed to expose the giant stones. Only the tops of these stones
were showing before excavation was begun; the resultant calculation
confirmed the age of this infertile blanket. Peat is decomposed
organic matter without the sweetening of lime. The resulting
material is sour, and highly acid in character, which checks the
bacterial action necessary for good soil to be made. With compaction
and age, peat becomes colloidal in texture, with a water content
of about 92 per cent. Peat is still being formed in Lewis,
though its progress is imperceptibly slow.

Frequent diggings have uncovered evidence that the island was 137
once densely wooded. The remains of trees, and the bones of cer-
tain animals and birds associated with savannah and woodland,
add point to this. Under the blanket of peat lies what is called 135
boulder clay, glacially deposited on the gneiss rock; many acres 134
of this clay have been exposed through centuries of digging up
peat for fuel. Such skinned ground is called *gearraidh*, and it 134
forms the basis of a soil which, when worked together with shell
sand and seaweed, becomes quite fertile. Of natural soil, so much
taken for granted in richer places in Britain, there are a few
patches in Lewis, at Garrabost and Ness, the valley of Strond,
near Rodel in Harris, has much strong red loam.

A HARRIS VIGNETTE

166 vision of adequate educational facilities in remote spots becomes
871 increasingly difficult.

In its time Scarp has contributed more per head of population
to the professions than has any other community of similar size.
The last of the native Scarp population left the island in 162
November 1971: two families totalling seven people. The island 178
has now attracted the attentions of a hippie community.

Scalpay

195 Scalpay Island, on the east side of Harris, was formerly occu-
361 pied by two or three tacksmen in succession before being 'crofted
429 out'. About 1843 the Harris factor settled twenty crofting families
who managed to make a fair living there, but five years later
another twenty families were added; some had been evicted from
the island of Pabbay in the Sound of Harris. This led to some sub-
division of the available land. The 1861 population was 388, but
the figure rose to a peak of 624 in 1921; in 1951 it had declined
to 541. It is now in the region of 450.
198 Island Scalpay is the last one of the few places in the Highlands
621 and Islands area in which the normal trends associated with re-
mote regions are operating in reverse. The island despite its small-
131 ness—it is a mere 3 miles long and 1½ miles across—supports a
thriving and dynamic community and is the envoy of its neighbours.
(162) Scalpay is retaining its young folk; and it boasts some of the finest
homes in the Hebrides. From the agricultural point of view it is
not greatly different from other islands in the Hebrides. Its forty
241 crofts produce a good crop of oats; but less than 20 acres of the
land are re-seeded.
226 The land being as poor as it is, the men of Scalpay have turned
their faces to the sea—for a living, not for emigration. Scalpay
has the largest number of full-time fishermen and a total of thirty-
505 three boats, twelve of which are ringseiters of over 40 ft. Native
enterprise is also shown in the ship-owning firm whose vessels
carry freight and passengers to many parts of Scotland and on
441 occasion to the Continent. A Harbour Association was formed on
the island in 1966 to work for local amenities for fishermen and

SCALPAY

the community generally—in particular for a landing stage in the 505
North Harbour. The lighthouse at Eilean Glas, Scalpay, was in 441
fact erected as long ago as 1788; for a long time it was the only 502
lighthouse in the Minches. Indeed, in 1792 it was described as 'one
of great utility to the numerous shipping that frequent this
channel [between Skye and the Long Island] on their voyages to
and from the Baltic'.

The independence of the islanders again appears in their atti- 181
tude to the education facilities provided for their children. In 871
1949 Scalpay parents staged a school strike in protest against the
delay in the construction of a road to the school. At present the
island has a junior secondary school but in 1966 the Inverness-
shire County Educational Authority proposed the transfer
of the island pupils to the school at Tarbert; this would mean
each child rising early in the morning to face a trip across Scalpay
Sound and then a road journey to Tarbert. The inevitable
protests against this proposal were rooted in its deeper implica-
tions. The school roll on Scalpay (70 pupils) has maintained a
remarkable level of continuity over the years, reflecting the
general prosperity of the island. Forced attendance at a central
educational facility, the islanders maintain, will introduce an
unsettling urban element into their children's adult views.

The smaller islands

To the west of Scalpay, in East Loch Tarbert, is the one- 361
square-mile island of Scoraway. Its population was 14 in 1861, 162
none in 1881, 18 in 1891, 15 in 1901, and 20 in 1911. In 1921 175*
7 males and 12 females lived there, but none permanently since. 131

On the west of the Harris mainland is a high rocky island, four
miles by once, called Taransay. In 1549 Donald Monro described it
as being 'well inhabit and manuirit', a place where people delved
with spades, and with good barley and corn, and fishing. There
are two old chapels and a burying ground on the island. The
population of Taransay has declined to a handful through the
years; its peak was 76 in 1911.

The Sound of Harris is 'a chaos of rocks and islands', so numer-
ous that they cannot easily be counted. Some are mere pinpoints
of rock; others once supported small populations. Nearest to the

A HARRIS VIGNETTE

Nearest to the
361 southern shore of Harris is the verdant arable island of Ensay,
162 two miles in circumference. The peak population was 15 in 1861,
but in 1951 and 1961 there were two men (seasonal shepherds).
*175 Just south of Ensay is Killegray, two miles long. In 1792 it was described as 'one
• 131 was uncultivated, though a good source of peat; five people lived
on Killegray in 1861, 3 in 1911 and 1921, 5 in 1931 and none
in 1951. An 1865 report mentions that there was only one house
on the island, so the population must have been one family only.
Four to five miles west of Killegray is a low-lying, fertile island
131 of about four miles by 1½. This is Bernera Harris which, though
lying nearer to North Uist, is included in the civil parish of Harris.
It still carries a fairly large population. Until the early eighteenth
century it was occupied by a tacksman at one end and a commu-
nity of crofters at the other. Later there was an influx of people
evicted from Pabbay and the mainland of Harris. Some clearing
of families from Bernera itself took place. In 1861 the population
of Bernera was 315; it rose to 324 in 1901. Three schools were open
89 on the island in 1865: an SSPCK school, a Gaelic School Society
school, and a 'female industrial school' supported by the SSPCK
and 'taught by a venerable Highland lady in receipt of a salary
of £28 per annum'. The school was housed in, to quote an 1865
report, 'the oldest dwelling in the Long Island, and was at one
time inhabited by persons of distinction. In the outer wall is a
marble slab bearing this inscription: "Hic Natus est/Illustris Ille/
Normannus MacLeod/De Bernera/Quam Amavit." (Here was
born that famous man, Norman MacLeod of Berneray, a dis-
tinguished knight.) This illustrious personage and his brother, Sir
Roderick of Talisker, were both knighted by Charles II for dis-
tinguished services . . . A grandson of Sir Norman became known
in the annals of the Bench as Lord Bannatyne."

Three miles north-west of Bernera is Pabbay, also in the parish
of Harris. At one time Pabbay was a rich green island, the
'granary of Harris', and supported a considerable population.
Early last century it was inhabited by 26 families (about 100
people), who lived in comparative comfort, and by 1841 the
population was 338. But Pabbay was cleared of its people. Some
emigrated to Australia, some went to other places nearby, such
as Scalpay, Bernera and the Bays area of Harris. In 1858 only a

THE SMALLER ISLANDS

shepherd's family was left. Pabbay is conical in shape, and about 361
2½ miles in diameter. In recent times drift and sea spray have 162
damaged its fertility. 175*

Just north of Pabbay is Shillay, one mile in circumference, 131
where Martin Martin (1695) says he found sheep with the biggest
horns he had ever seen. Whether Shillay was ever inhabited is
not known.

10 THE OTHER ISLANDS

361 THE continued evacuation of islands is a problem peculiar
162 to Scotland. In the eighteenth century some 8 per cent of
175 Scots lived on islands; today the figure is less than 2 per
*175 cent. Island populations today account for about 30 per cent of
178 the total Highland (crofting counties) population. The difficulty
182 for most islands is the relationship between population density
and potential for economic development.

As though reflecting the relationship of man to man on Lewis-
with-Harris—keeping together in community for survival—the
other islands, the larger island ones have given rise to a sense
at one time or another in recorded history. Most of the socially-
significant islands of Harris have been described in Chapter 9.
Lewis has very few, and these are mostly far-flung oceanic out-
liers.

236 *North Rona*
221 To begin at the northern point of the Lewis parish, about 45
133 miles NNE of the Butt of Lewis is North Rona, a block of horns-
• 131 tone schist with pegmatite intrusions. Though the island has
361 never figured in any Census reports, since the Census began, it has
been inhabited from time to time. Of about 300 acres in extent,
it is cliff-bound and reaches 355 ft at its highest point. It lies in a
part of the Atlantic where a deep swell seems perpetual, and land-
ings can be difficult.

361 Dean Monro comments: 'Towards the north northeist from
*195 Lewis, three score myles of sea, lyes and little ile callit Roney,
laiche maine land, inhabit and manuirit be straple people, scant of
ony religione.' The Dean's 'simple people' were no recent settlers.
They were in fact the continuation of a community which had
inhabited North Rona for at least 700 years previously. Tradi-
172 tion has it that the first inhabitant was St Ronan, who built a
small monastic cell or hermitage there some time during the
eighth century, but there may have been earlier inhabitants.

THE OTHER ISLANDS

*175 Account, there was one family there, that of the person employed
162 by the owner to look after the livestock. The owner was a Ness
522 tacksman who paid £4 sterling rent per annum. The island pro-
duce was corn, butter, cheese, a few sheep and sometimes a cow,
and some wild fowl and feathers.

*175 In 1844 Rona was evacuated, its last inhabitant being, in the
166 seventh year of Queen Victoria's reign, the 'King of Rona',
Donald MacLeod, who lived in almost prehistoric conditions.
Rona was without inhabitants until 1884, when a last attempt
495 at resettlement was made by two men from Ness. This was a self-
imposed exile, after a difference of opinion with the minister of
their parish; in penance, they hied themselves off to Rona. In
1885 a relief boat called and found both men dead, one from
natural causes, the other from starvation and exhaustion after
nursing his friend. By the fireside of their hut was a pot ready
for the preparation of a meal they never ate.

236 Today, man's connection with the island is maintained by the
221 small party of Lewis shepherds who each year make the journey
to shear the sheep which still graze on the green slopes around the
now-ruined village. Otherwise, only the occasional traveller now
659 lands there. In June 1956, North Rona with its associated rock,
185 Sulasgeir, was declared a National Nature Reserve on account
of its importance as a breeding ground for colonies of oceanic
birds—guillemots, puffins, kittiwakes, and fulmars—and for its
seal colony.

133 *Sulasgeir*
• 131 Sulasgeir is twelve miles west of North Rona, a lonely rock in
the Atlantic, bleak and grassless, and tunnelled by caves and
gullies. The only life it has ever supported is seabirds—officially.
495 Yet one of the old buildings is said to be a chapel and is called
173 'Tigh Beannaich' (House of Blessing). According to Ness tradi-
tion, Sulasgeir was once used as a prison for sheep-stealers, and
it is also said that Brenhilda, sister to St Ronan, was left on the
island to perish. Yet another tradition claims that it was at this
rock that Prince Charles Edward made his first contact with his
Scots clansmen, when the ship that carried him to Scotland was
spoken to by a Ness boat making for North Rona.

CHAPTER NINE

THE ISLAND OF BERNERA AND

ADJACENT DISTRICTS OF THE MAINLAND OF

LEWIS

('Bernera and Bernera Shore')

by

P. Wheeler

131 Of the three main sections of the parish of Uig, the Bernera district, consisting of Bernera Island (Breaclete, Croir, Hacklete, Kirkibost and Tobson) and the "Shore" [103 (Earshader, Crulivig and Lundale together with the isolated township of Linshader), presents a number of peculiarities due not primarily to physical conditions, but to isolation. [49 Bernera Island, though central to most of Uig and easily accessible over the sheltered waters of Loch Roag, yet remained relatively inaccessible overland until the recent building of the road bridge; even now it is necessary to travel over six miles to get from the bridge to the main Uig road and a further four miles to Garynahine. Consequently [181 the island, even more than the adjacent mainland settlements, has a very close-knit and self-sufficing population. Whether this community retains sufficient vitality to resist the destructive effect of better communications in addition to the general forces eroding rural and especially Highland life, remains to be seen.

13 The district shares the unpropitious physical characteristics described in the introduction. Like the other districts it has virtually no valuable mineral resources (1), and 228 the herring and white fish industries have all but disappeared and seem unlikely to 121 resuscitated. Lobster fishing is, however, prosecuted with vigour and enterprise; it 464 provides a good living but only for a small group of families. The rest depend on regular or casual employment to eke out the proceeds of the croft. The kinds of work [164 available, and the problems of permanent or seasonal absence in search of employment are common to the whole parish; thus this account is mainly concerned with the problems of crofting agriculture.

Settlement: history and patterns.

172 The pattern of settlement in this inhospitable and discouraging environment is partly very old, and partly very recent. At least four brochs are known on Bernera and various 361 standing stones of even earlier date, while continuous settlement has survived from the early Christian era. Traces of old patterns and practices remain, in tangible form as [173 in the graveyard on little Bernera, or in oral tradition. All this contributes towards the very close network of family relationships that binds the island folk and to a lesser extent those of the adjacent mainland.

With the exceptions of Tobson, Bosta and Breaclete, all Bernera Island had been 175 cleared by 1851. Resettlement began in 1878 when twelve families were moved from 361 Bosta to Kirkibost, and continued at Hacklete in 1880, and subsequently elsewhere. Occasionally (as at Kirkibost) old, pre-clearance lotting patterns were re-adopted, but usually settlement was laid out afresh. The townships of Bernera Shore, were also affected: all the small tenants except those of Earshader and Crulivig were cleared, leaving the land under the sheep farms of West Earshader and Linshader. However, the Bernera Island crofters were allowed to continue their customary use of shellings on the mainland, and the transfer in 1880 of these grazings to their present position marked the

[313 (1) A small deposit of diatomite has been exploited in Kirkibost since 1959. Only a few men are employed and the number is not likely to increase.

[TEXT CONTINUED ON PAGE 61]

THE ENVIRONMENT

13 The district of Park lies in the parish of Lochs in south-east Lewis, almost cut off from the
101 rest of Lewis and Harris by Loch Erisort to the north and Loch Seaforth to the west. The district may be divided into two regions by Loch Shell and the valley to the west; this subdivision is meaningful physically, historically and from the socio-economic point of view.

13 The northern part of Park is a low, mamillated, ice-scraped plateau at an average altitude of 250 feet and a maximum altitude of about 450 feet, developed on Lewisian gneiss, a resistant acid rock of Pre-Cambrian age. Glacial erosion has scoured the area and expanses of bare rock are everywhere apparent. Coarse drift deposits are scattered throughout the area, but are more continuous along the southern shores of Loch Erisort between Shieldernish and Caversta, and at the head of Loch Ouirn. The cool, humid oceanic climate has led to the widespread accumulation of peat, and in the interior there are extensive areas of blanket bog. The Minch coast is rugged with cliffs attaining a height of 350 feet at Kebock Head, but there are several sheltered bays and inlets around which the crofting townships cling to the steep slopes. Along the more sheltered shores of Loch Erisort cliff features are almost absent and the physical landscape is less harsh and uninviting.

The mountainous area south of Loch Shell, an eastward continuation of the North Harris hills, attains a height of 1,885 feet. Glacial erosion has had more spectacular effects than in northern [13 Park and corries and glacially modified valleys are numerous. Southern Park is now uninhabited but during the early ninsteenth century a small population was scattered round the shores of the peninsula on areas of drift deposits.

There are no climatic statistics for Park, but the Stornoway figures can reasonably be applied to northern Park. The mean annual temperature for Stornoway is 47°F. ranging from 41°F in January and February to 56°F. in July. The mean annual rainfall in Stornoway is 50 inches, with May and June the driest months, but on average there are 260 rainy days. Wind, however, is the most notable element in the climate: an average of 155 days have gusts exceeding 38 m.p.h.

Soils are thin and immature, except on isolated patches of deeper drift: vegetation is dominated by heather (calluna vulgaris) purple moor grass (molinia) and sphagnum, and there are few trees, stunted rowans being almost the only species; trees are confined to islands in lochs and cliffs inaccessible to stock.

361 The aspect of Park is thus one of desolate moorland, and the human communities are without exception distributed round the coasts; the Minch coast townships are situated on sheltered bays or inlets and it is clear that the harvest of the sea was the original attraction rather than the agricultural possibilities on steeply sloping, rocky terrain.

181 Park is the most isolated area of Lewis apart from South-west Uig. A sea-journey of only nine miles separates Lemreway in the south from Stornoway but the overland distance is 36 miles, which takes more than two hours by the daily bus service. Until 1924, there was no through-road beyond Habost although the Congested Districts Board provided a grant for the making of a road between Gravir and Cromore in 1901; in 1913 this road was extended to Garyvard. With the coming of the road, and the decline in the numbers of fishing boats, the people of Park have ceased to travel to Stornoway by sea. In terms of distance, Park is now more isolated than ever before.

101 Isolated, poor agriculturally, and without any industry, Park is a "Region of Difficulty" with 13 a rapidly declining population; basically the environment has little to offer in the twentieth 12 century.

131

131 LOCATION--latitude and longitude; position in relation to land and sea (
insular, coastal, interior); area of territory occupied; accessibility by
land and sea routes; boundaries; etc. See also:

Territorial organization . . . . . 63 Maps . . . . . .
Location of group in relation to others . . . 101

Dean Monro, in his 1549 account, refers to the vast numbers of wild fowl and mentions that the men of Ness sail there and stay for seven or eight days and bring back a boat full of dried wild fowl and feathers. The *Old Statistical Account* (1796) says: 'There is in Ness a most adventurous set of people who, for a few years back, at the hazard of their lives, went there in an open six-oared boat without even the aid of a compass.' The boat, says the *Account*, could not be pulled up out of the sea, and therefore, while some of the men worked on the birds, the others had to stay in the boat on the most sheltered side of the sheer-cliffed island. This custom of hunting young gannets (or 'guga') on Sulasgeir still continues. Under the Protection of Wild Birds Act, 1954, the gannet is protected by law, but so that the Ness men could continue their old custom, a Statutory Order was passed making a special exemption (from 31 August each year at the end of the close season) of the gannets on Sulasgeir. With North Rona, Sulasgeir is one of the great breeding grounds for British oceanic seabirds.

The Loch Roag islands

The one large inhabited island off the Lewis coast is Great Bernera, though technically it is not now an island, having been connected to the mainland of Lewis in 1953 by a bridge. It is part of the parish of Uig, as are the other islands in Loch Roag. Its population reached a peak of 730 in 1911, but has now fallen to about half that figure. Off the west of Great Bernera is Little Bernera, which in Dean Monro's time was 'inhabit and manurit', but which has had no population recorded since the 1861 Census. Monro describes it as full of rough little craigs, but with fertile earth between.

Also in Loch Roag are three islands which, now deserted, once supported families: Pabbay had 17 people in 1861, 9 in 1881, and none since; Vacsay had nine men in 1861, and none since; Orasay in 1891 had one man and one woman, but none since.

The Flannans

Belonging again to the parish of Uig is the group of islands known as the Flannans, or Seven Hunters, some twenty miles

CHAPTER I

ENVIRONMENT AND LANDSCAPE

(A) THE GEOGRAPHIC SETTING: THE BRITISH ISLES, SCOTLAND AND THE HIGHLANDS AND ISLES

1. *A 'Heart' of the 'North and West' of Britain*

181 [131] [133] [174] IN the 'Outer' Hebrides, commonly regarded as the most 'outlying' inhabited lands of the British Isles, are revealed not only the most ancient of British rocks, the Archaean, but probably the oldest form of communal life in Britain. This life, in present and past, will interest

102 131 133

FIG. 1.—Global view of the 'Outer' Hebrides, seen as the heart of the 'North and West' of Britain.

181 [171] [133] some by characteristics which may seem unique. But it will interest others by features of underlying universality. These might be compared to the Archaean rock, overlain toward the south-east by a succession of younger strata, but forming their foundation.

181 182 In this rocky land, the roots of Island life are laid bare; the rhythm of work responds to the day's weather and the cycle of the year. Yet the flowering of communal life in song and spiritual tradition may offer a fresh vision of regional, even of national, being. Indeed it is in characteristics latent in the evolution of the whole 'North and West' of the British Isles that Island life is most revealing.

• 131 133 Rising in imagination to a point above the summits of the Harris hills, and viewing the British Isles from the far' north-west, we gain a new perspective (Fig. 1). The Island below us is now the nearest; the 'Outer' Isles, [829] the innermost. To us now, as to the Islesmen, their Island home is no mere fringe, but a heart of Britain.

101 133 Thence, looking to the lands across the Minch, each further from the Isles of home, there appear, in turn, three regions: (1) the rest of the Highlands and Isles; (2) the Lowlands and Uplands of Scotland; and (3) Ireland, Wales and Cornwall, and Northern England—all sculptured in rocks older than those of the Lowland or 'Plain' of England beyond. These three roughly concentric regions, from Harris to the edge of the 'Plain', may be grouped together with the intervening estuarine lowlands—not only Clydeside and the Solway but the 'firth-land' of Mersey-and-Deeside, and that of the Bristol Channel. To these, one might add the shores of an outer Minch, the *Manche* or 'English' Channel, which once linked Devon and Cornwall to Armorica. Beyond

101 133 Britain, on the horizon, the eye may descry the coasts of Scandinavia, the Low Countries, France and Iberia. This far-flung regional grouping within the British Isles—which extends for 800 miles from the Shetland to the Scilly Isles—may be called 'the North and West'.

Four border-lines may be drawn to bound these regions: the hill-foot 'Highland Line', the Scottish Border, the border of Wales with the Pennine-and-Moorland-foot, and lastly, for the whole, a line drawn from the Severn to the Tees. Of these four lines (or border-tracts), the last, which divides the British Isles into two different types of landscape and life, is not the least significant. On one side lies the whole of 'the North and West', with its isles and headlands, its mountains and hills, hewn in old rock, and its firthlands, straths and marginal, hill-foot lowlands, all sculptured markedly both by rivers and ice, and heaped with glacial drift. On the other lies the 'Plain' of south-eastern England, or simply 'the South-east', of which the low scarplands of younger rocks slope smoothly down to mainly river-sculptured vales, and are bounded by smoother coasts.[1]

133 • 131 Geographically, this succession is one of complexes with recurrent features of height and hollow, land and sea, rather than of sharply defined blocks; its marches are tracts of transition rather than boundary lines. But essential characters of the two zones are revealed by the main boundary

[823] [1] Strictly, the alternation of vales with wolds and downs, which characterises England south-east of the Pennines, would justify the term 'lowland'; but with our Scottish and Highland perspective, the English 'lowland' appears a 'plain', and for simplicity, the 'Plain', or simply 'the South-east', is used throughout this book. The physical and geological maps of the British Isles in an atlas may serve to illustrate this perspective; they should be viewed from the north-west by turning the map with the north-west islands towards one, and the plains of England and the Continent furthest away.

133 line; and there can be no doubt of the contrast found at • 131 the extremes. How strikingly different from any view over the English Plain is this, from the air or a mountain-top! It overlooks the ice-scraped rock of the fells; the drift-heaped, ill-drained hollows studded with gleaming lochs and deeply overgrown with peat; and the indented, insular coastline with its widely spaced crofting townships looking seaward, where a few fishers' sails may dot the 161 vast expanse of ocean. In 1951 the population of Lewis-162 and-Harris numbered only 28,000 persons, and that of the entire Outer Hebrides some 36,000; but the small num-182 bers need not lessen the geographical significance of the community.

18 Men have long recognised the homogeneity of the English 'Plain', with its recurring vale and wold, compact within a rounded coastline. In spite of the local variety of landscape, history or dialect, which enriched its heritage and compose its grandeur and charm, men have sensed the unity inherent in this land of a single tongue, centred upon a single capital. By contrast, the diversities in landscape, life and tongues of the lands far-flung to north and west have obscured the elements of a profound, underlying unity in geographic origins and in historic and social [121] evolution. To understand the civilisation of the British Isles, it is vital first to perceive the complementary qualities found in the two great regions, and face their corresponding [178] weaknesses or limitations. Second, within the less understood of the two regions, 'the North and West', it is vital to study the almost bewildering variety in regional types of life—distinguishing, for instance, the uprooted populations all too typical of the rural Lowlands of Scotland or Northumberland from the still deep-rooted communities of the Highlands and Isles.

183 181 185 democratic reorganisation, with loyalty to one's fellows and to a leader.

Here again, Lewis-and-Harris may have something to 178 teach, as one of the last communities in Britain in which 185 much of ancient common right over land and sea has been upheld. Trust ownership of Stornoway estate has strength-[174] ened the possibilities of rural planning there, while the [423] fisheries are a public resource which are partially protected for local fishermen inshore and farther out are closed to none. The useful Lewis Association has published models of local survey for social and economic planning. At a time when democracy is struggling to see its way towards economic and social freedom, such communal initiatives have more than local significance.

121 This sketch of comparisons and questions in rural life • 131 raised by Hebridean evidence, through a wide and varied 182 region of the British Isles, must serve to indicate the geographic setting of the Island and relate the historic and contemporary problems of its own community to wider fields. This book is not directly concerned with the urban and industrial problems of the firth-sides and 'included plains' within the varied land of 'the North and West' of Britain, deeply though they affect the hard-hit fishermen of the Isles and the Island migrants—seamen or labourers, tradesmen or factory workers, nurses, teachers or clergy. 121 Even for the migrants' sake, it is vital to maintain the 185 economic balance, and restore the cultural and spiritual life within each industrial region, in order to maintain that of Britain as a whole. It was not enough to schedule 'the murdered towns' of Tyneside, Wales, Lancashire or Clydeside as 'Distressed', 'Special or Development Areas'. The balance of Britain as a whole must be restored.

FIG. 2.—Map to show (i) the use of land and sea in and around Scotland, with special reference to the Crofting Townships Zone of the NW. Highlands and Isles, and (ii) the average size in each county of labour-teams of farms and small-holdings in the Lowlands

182 Let us begin with the economic and the social signi-
184 ficance of the Highlands and Isles with which we are
311 concerned. Economically the crofters' 'living space' is the narrow interrupted belt of improved land (shown black)
[241] which is generally fronted by the sea and its inshore waters,
[427] and is backed by the Crofters' Grazings (enclosed by line C on the map). Some 700 crofting townships or com-
[361] munities are found in Zetland, the North-west mainland and the Western Isles, each with its Common Grazing; the line C also encloses a small area devoted to other grazings. Deer forests predominate on the eastern, mainland, side of the line. On the remainder of the hill country are to be found the hill-sheep farms, with other small farms and small-holdings.

174 In the past the fishing crew at sea and the joint labour-
621 team on land formed the communal units contained within

(The numbers in brackets are the averages for Scotland.)

3. *The Significance of Lewis-and-Harris*

181 The Highlands and Western Isles today, "The Land
184 of the Gael", may thus be grouped as two regions. The
361 North-west is mainly of 'township crofting' and distant
101 from the Lowlands—the other mainly of farming, living nearer to the Lowlands and in touch with them. Through-
[197] out the North-west, Gaelic is still the common speech,
[198] even of the children. The old community feeling is strong; it is that, indeed, which keeps the people attached to the villages.

101 From the plains and cities of the South it is a far cry to *Ultima Thule*, as Lewis, like Zetland, is sometimes called
• 131 even by its own people. Lying some twenty-five to thirty miles across the Minch from the mainland, its nearest links
[496] with the South lie even farther away. From Stornoway it is some seventy-five miles to Kyle of Lochalsh, the rail-
head for Inverness and North-east Scotland, and 100 miles to Mallaig, the railhead for Fort William and Glasgow. To reach Stornoway over the moors from the west coast
[504] townships is itself a journey. Stornoway is the Island's only port, though passengers are put off at Tarbert, at
[177] Stockinish and at Rodel in Harris. Isolation has always
[178] been a dominant factor in the Island's life. From pre-history through the Middle Ages to modern times, that factor played its changing part.

198 In Lewis, conditions had changed less than elsewhere during the last century; for example, the *New Statistical Account* of South-west Argyll in 1830-35 reads like a description of conditions in Lewis as they were until after 1914! Hence, as already said, the contrasts are very great indeed in the aspect of the country, its fields and houses, and in the number, character and ways of the people. It

241 Scotland had begun to lag since her pioneering effort from
134 1750 to 1880.
178 Fortunately, Scotland is now recognising that in peat
[654] reclamation, on the one hand, and the improvement of rough grazing, or at least its maintenance, on the other,
[185] there lies a problem of national importance. More than
311 half the land surface of the country consists of mountain and heath land used for grazing, not including 'deer forests' from which sheep had been altogether excluded. The arable land of Scotland is less than one-sixth of the whole, with about one-twelfth in addition under permanent grass. Moreover, since most of the enclosed land is distant from the area of rough grazing, the latter is partly wasted. The difficulties of soil and sea and of the whole economic situation are great, and must be understood.

(B) THE ISLAND LANDSCAPE, LAND-FORMS AND GEOLOGY

1. *Aspects of the Isle*

• 131 Lewis-and-Harris, the most northerly isle of the Outer Hebrides, and the largest, is roughly lozenge-shaped. Although only thirty miles in width, it is over sixty miles in length. Attached to Harris parish is the little isle of
[103] Berneray, half a dozen miles farther south. It puzzles the stranger that, while the archipelago of the Outer
[823] Hebrides is best known to the inhabitants as "The Long Island", Lewis (or the Lews) and Harris, which actually form one island, are spoken of as separate islands.[1] Yet nothing could be more natural. Before the making of

[113] [1] "The Long Island", Gaelic *An Eilean Fada*, as a name for the Outer Hebrides has the sanction of traditional usage, as Alexander Carmichael noted in his Introduction to *Carmina Gadelica* (vol. i, 1900; and 1928).

131 632 (1) Stornoway stretches from the town north to Tolsta;
(2) Barvas from the north of the Island southwards, past Barvas village (WNW. of Stornoway) five miles further to Bragar;
(3) Uig covers the rest of the south-west coast; and
(4) Lochs, the remainder of the south-east coast.

131 133 Seen from the sea, the Island chiefly presents dark, gneissic, heath-fringed cliffs whose steep walls become gentle slopes towards the south as we enter the bays, sea lochs and firths which run far inland (Plates I to IV). As one sails northward along the east coast of Lewis, there are few hills to be seen, and these are below 1000 feet; most of the island is rolling moor, rarely rising above 300 feet. Here and there new houses stand out, the 'white houses' (*tighean geala*), which, however, are usually grey 342 or even dark in colour. These dwellings have generally been stone-built and were often slate-roofed; asbestos roofs are now common. Yet even when dark, these new cottages are conspicuous beside the low 'black houses' with their rounded forms of wall and roof, and with thatch overspread by a faint haze of blue peat reek, like the bloom 133 upon a fruit. Their plots of corn, though each may be so [243] tiny as to appear but a spot at a distance, together form a bright patch against the dark brown moor. In the sketch which forms the Key to the Map of Vegetation and Settlements (Fig. 8), an attempt has been made to bring the map and the landscape alive to the mind's eye, from the hills of North Harris north-eastward to the Butt of Lewis.

131 133 Turning the north cape of Lewis, 'the Butt', and sailing southwards along the west coast, we see hills increasing in height in the Uig district, rising to those of Harris with

131 133 summits of up to 2622 feet. South of this chain of hills the ground drops again on a peninsula some twelve miles long and only seven miles wide. This forms the more populous part of Harris with its 'sandy shore', the Machar, facing the Atlantic, and its rocky bays and fishing hamlets [134] on the Minch.[1] Lewis has its 'machars' too, areas of [504] white shell sand, which is so light that it blows up the hillsides, thus improving the pasture-land; but there is little 'machar' on the eastern coast, save for the south-western shores of the great sandy North or Broad Bay, enclosed by the peninsula of I, or Eye, which also acts as the outer breakwater for the harbour of Stornoway.

131 133 361 [137] Landing at Stornoway and leaving behind us the pines, and the wind-pruned sycamore woods around Lews Castle, we find ourselves among the small fields of the villages which are partly suburban to Stornoway. Inland stretch the gently rolling, brown and somewhat melancholy moors that cover so much of the Lews. From the Butt of Lewis to the beginning of the Harris hills one could make a bee-line SSW., midway through the Island for over thirty miles, without passing a house or a strip of corn, and seeing only a tiny, ramshackle hut, a shieling (or *àirigh*), used for six weeks in the year when the cattle are taken to the summer pasture. All the villages are in sight of the sea, and generally close to it, with only one inland exception, Achmore, south-west of Stornoway, founded after 1850. The hills of Harris are not less lonely than the moors of the Lews.

18 131 133 Diversity is one of the fascinations of such an island as this. Although, like the founders of Stornoway, all

[1] *Am machair* ('ch' as in 'loch', also anglicised as 'macher'), n.f. the plain, smooth beach-land or links. A sandy beach or ebb-strand, *tràigh*, n.f., backed by *machair*, contrasts with a pebbly beach, *cladach*, n.m., backed by rougher beach-land, as in the Cladach district of W. Lewis.

18 these communities of 'fisher-crofters' settled at the
131 ing of sea and land, yet differences of topograph
133 situation are still accompanied by differences of em
in their dual way of life. Although insularity migh
one to presuppose homogeneity, actually the seawa
which an island may be reached may bring grou
different race to land at different spots, each spot a
priate to their way of life. Differing social economie
develop there, and differences of race may be mainta
divergences are found along with the convergence d
the elements common to the whole island and t
[178] history. From prehistory to the coming of Leverh
we shall find this crossing of influences in the I
microcosm, the Island drama.

2. *Structure and Rock-types of the Western Highland and Isles*

133 In Fig. 3 are sketched those features of structure
rock-type which have guided the work of ages of ero
influencing both the 'plan' and coastlines of We
Scotland and the surfaces and scenery of the land.
their turn, both surface and mineral composition
influenced the life of plants and animals. This sketch
should be compared to an atlas map of relief, settlem
and routes. This less familiar aspect has been sele
both because rock-type is a factor in the causation of l
forms and soils, and because rock structure is basic to
forms and coasts of the mainland and the Isles.

[131] The parallelism of the main trends on either sid
the Minch is seen in the structural boundaries of its co
which are of Archaean rock or Archaean foundation (A
Fig. 3), as are Coll and Tiree, and South-west Is

102
• 131
133

FIG. 3.—Sketch map of selected features of structure and rock-types of NW. Scotland

133 Except for this fringe, the prevailing rocks of the Highlands include acid rocks: the Moine Schists, the 'Dalradian rocks' of the South-west, and the granite masses such as the Cairngorms. Plateau surfaces and benches, worn, uplifted and stepped at various heights, were veined by torrent and river, cutting narrow valleys; and later these river valleys were gouged and widened by glacier and ice-sheet to become steep-sided glens and wide-floored straths.

• 131 Between the main, parallel coastal trends, Skye stands out as a great extrusive mass of lavas—not acid but basic in composition, almost 'bridging' the Minch and the Sea of the Hebrides.

Forces of stress, strain and shear are betrayed by 'lines of crushing' in the Outer Hebrides, and of faulting (FF) on the mainland. Most notable of these fault lines are those of the Great Glen and of the 'Great Boundary Fault' that divides the Highland from the Lowland rocks, extending from Arran and the Lower Clyde north-eastwards. Still other trends are revealed by the lines of sea-loch and river, lying not only SW.–NE. but W.–E. and also NW.–SE. These lines linked the greater inhabited coastlands, loch-sides and straths of the Moray Basin to the North-
131 west. Finally, a line of overthrust, from near Cape Wrath

Lewis and Harris

Before the making of roads, it was ease of sailing which united island peoples and their territories. One can wade or drive, at low tide, over the fords that unite the Isle of Benbecula with the two Uists, North and South: in fact, a bridge now connects Benbecula with South Uist. But only the roughest of hill tracks led through the hills of North Harris from the 'Tarbert' or Isthmus of Harris to the nearest habitation at the head of Loch Seaforth or Loch Erisort, in the Lews. This is a distance of some twenty miles, or a fair day's tramp for an unloaded man, and far too much for a return journey in one day. Hence separation of territory and name was natural. This separation no longer exists as there is now a good 'bus service from Rodel via Tarbert to Stornoway which links Harris with the daily Kyle to Stornoway steamer. In this book, the Island, or the Islanders, refers to Lewis-and-Harris with its people, as one.

Lewis is included in Ross-shire (of which the county town is Dingwall, north of Inverness) and Harris in Inverness-shire, together with the rest of the 'Long Island'. The county boundary cuts across the six-mile isthmus north of the hills of North Harris, from the in-reaching Loch Seaforth WNW. to Loch Resort (Fig. 8). All the Outer Hebrides are now included in the Parliamentary constituency of the Western Isles. Proposals to unite the Island under one District Council, or the Outer Hebrides under one County Council, are more favourably viewed in Stornoway than in Harris or the Southern Isles. Harris forms one civil parish, while Lewis is divided into four: Stornoway, Barvas, Uig and Lochs. The Lewis parish boundaries traversing the moors are inset in Fig. 8 so that their trends can be readily grasped, and the inhabited portions of the parishes quickly located (p. 50).

PLATE II. AIR VIEW OVER STORNOWAY BAY, LOOKING NORTH

The Point, with the inner harbour behind, is the nucleus of the burgh; nineteenth-century extension filled up the ground inland. Lews Castle is on the left

THE OTHER ISLANDS

north-west of Gallan Head. There are seven main islands, all small, high and cliffbound, and a number of rock stacks and islets. All are uninhabited. Eilean Mhor, the largest, of 39 acres, has an automatic light. Dean Monro's description of the islands as 'nouder manurit, nor inhabit, but full of grein high hills and scheipe' still holds, for sheep are taken annually from Lewis to the grazing on the Flannans. Their name is said to be derived from the ninth-century St Flann, whose saintly influence was recognised during the centuries when men from Lewis visited the islands for their harvest of wool, wild fowl and feathers.

The Flannans were the scene of a great sea-mystery: the complete and utter disappearance of three men from the lighthouse at the turn of this century. In December 1900, the lighthouse, with its 140,000-candlepower beam 283 ft above sea level, was a year old. It had taken four years to build instead of the estimated two. All the materials had to be swung up piecemeal from the boats and hauled up the almost sheer 70 ft cliffs to the top. That month a passing ship, the *Archer*, noticed that the Flannans light was out; a message was sent to the Flannans shore station at Breasclete, Lewis, and the *Hesperus*, preparing to pay a Christmas visit to the lighthouse, got under weigh.

Its crew landed and searched the island, but found no trace of the missing keepers. In the lighthouse was an uncanny silence. The fire was dead. The clock had stopped ticking. The beds had been made up in the clean, clinical way of all sailors. And in the galley, the pots, pans and dishes sparkled their welcome to the searchers. In the lamp-room the lamp was cold. The wicks had been trimmed and the lenses polished. The logbook showed a last entry on 0900 hours, Saturday 15 December. In the subsequent investigation some theories were offered in explanation of the disappearance, but none quite fitted. The mystery remains, a haunting, unexorcised cloud hovering over the island.

The Shiant Isles

Turning to the east coast of Lewis, in the parish of Lochs are the Shiant Isles, about 4 miles off-shore, across the Sound of Shiant (Gaelic: charmed, enchanted). There are three islands in the group: Eilean an Tigh (House Island), Garbh Eilean (Rough

THE SHIANT ISLES

Island) and Eilean Mhuire (Mary's Island). The Shiants are the eroded relic of the same age of volcanic activity that formed the strange-looking columns of Staffa and of the Giant's Causeway in Antrim. The mass of cooling molten rock slowly crystallised and changed in composition: the early-formed crystals sank to the bottom, the later ones being found nearer the top. In 1845 one family lived on Garbh Eilean, the largest, which is joined to Eilean an Tigh by a low storm beach; but the family was lost, falling over one of the great precipices which are a feature of the group. In 1821, 2 males and 4 females lived there; in 1891, 3 males and 5 females; and in 1901, 4 males and 4 females. But in this year the last family upped and went to Tarbert, Harris; for one of its members, a girl of 21, it was the first visit to the outside world. Since then there has been no permanent population. Back between 1811 and 1821 a visitor to the Shiants had some hard things to say about the filth and darkness of the shepherd's dwelling in contrast with the 'loveliness of nature, the bright sand, the fair rock, the enamelled green turf, and the sweetness of the summer breeze'.

Records show that at one time in the islands' history some sixteen people lived there, working small crofts. The ruins of their chapel can still be seen. The author Sir Compton MacKenzie had the house on Eilean an Tigh renovated for a stay there, and later the islands were bought by Nigel Nicholson, author and publisher. Today they are used for grazing sheep.

St Kilda

The St Kilda group of islands, some 45 miles off the west coast of Lewis, belong to the parish of Harris. These islands have an extensive literature and can only be touched on here. When the population was evacuated from St Kilda in 1930, the move broke for all time almost 2,000 years of continuous island living; they were taken off at their own request, after much careful and serious deliberation by the St Kilda 'parliament'. Life in Hirta, the only island in the group with a permanent human settlement, depended on the seabirds that breed in their tens of thousands on the cliffs of Hirta and Boreray, and the great stacks of Stac an Armin and Stac Lee. The flesh of puffins, gannets and fulmars

THE PARISH OF UIG

Isle of Lewis

CROFTING TOWNSHIPS
where a township name is repeated in an inland area the latter is a common pasture, former shielings.

TARRED ROADS B 8011

FARMS AND SPORTING ESTATES ARE NAMED

Figure 1.

/facing p. 1/

INTRODUCTION

131 The parish of Uig, Fig. 1, forms the south-west quadrant of Lewis; it falls naturally into three sections, each almost completely separated from the other by the salt waters of Loch Roag, Little Loch Roag and East Loch Roag.

South-west Uig is almost an island: only four miles separate the southern tip of Little
133 Loch Roag and the head of Loch Resort which, penetrating deeply from the Atlantic, marks the boundary between Lewis and Harris. It is a mountainous area with fifteen miles of exposed Atlantic coast between Loch Resort and Gallan Head. From the ultimate settle-
[491] ments, Brenish and Islivig, the main road (B 8011) takes a tortuous course of some 40
133 miles to Stornoway. Population is concentrated where soil and climatic conditions are
361 mitigated by the presence of machair (wind blown shell sand) and by the shelter afforded by the peninsulas of Aird Mhor Mangersta and Gallan Head. The chief settlements are thus around Uig Bay*, and on the western shores of Loch Roag. In addition each township has common pastures on the interior moors and mountains where shielings were maintained into the present century.

East of Little Loch Roag the road climbs over a moorland plateau at 250'-500' O.D.. More that 12 miles separates Enaclete, the last township on Little Loch Roag, from Garynahine, the first on East Loch Roag. The moor is uninhabited shooting and shieling ground; the population of this area is to be found to the north, on Great Bernera, an island now connected by a bridge, and on the adjacent mainland shore.

Eastwards again the inland continuation of East Loch Roag is a great peat-filled depres-
[491] sion which connects with Loch Leurbost on the east coast. This depression is skirted on its northern side by the main road, to Stornoway, A 858. The boundary between the parishes of Uig and Lochs cuts across this depression, which contains the only inland townships of Lewis - Loch Ganvich and Achmore. On the north-eastern shores of East Loch Roag is to be found more than half the population of the parish of Uig. The succession of densely populated townships from Garynahine to Carloway is much more typical of Lewis than are the more scattered and generally smaller, settlements of south Uig which are more like those of Harris, the Uists and Barra.

The sketch map, figure 1, shows the location and boundaries of the townships and other lands within the parish, and also the main roads. The reader will find it necessary, however, to make constant use of either Bartholomew's Half-Inch, or Ordnance Survey One-Inch to one mile, maps. In general topographic names are spelled in accordance with the latter.

103 * Uig: Vik, Old Norse for a bay.

/p. 2/

133 southwards to Skye, bounds the Archaean gneiss and the
131 stratified Torridonian sandstones of the North-west.

Given the possibility of 'continental drift', Scotland's NW. crustal block may have 'drifted' along the line of the Great Glen south-south-westwards for a distance of some sixty miles, relatively to the rest of the Highland mass. The primary evidence leading to this suggestion is the identification of the Foyers and Strontian Granites, situated on opposite sides of the Great Glen some sixty miles apart, as mechanically displaced portions of one original mass. Such horizontal movement may be related to the great Hercynian mountain-building movements of Carboniferous times so marked in south-east England.[1] This movement would have formed a major factor in leading to the development of the present structure and rock-types, plan and land-forms of the NW. coast and the Hebrides, Inner and Outer.

3. *Structure and Rock-types of the Island*

The axis of the Island lies NNE. to SSW. It consists of an ancient rock mass, the 'block' character of which is revealed by the geometrical mosaic of the coastlines and lochs. In simple terms, the fault lines are comparable to the long, fairly straight cracks to be found in any hard block of even consistency, split under stresses and strains. These systems of faults lie in at least two main directions. The main, axial trend is followed by South Harris and by much of the east coast. Each trend seems to have other faults lying at an angle to it, though not necessarily at right angles. Hence we find more than four main trends for the lines of coasts, lochs, rivers, bounding the hill blocks. These must be due to somewhat different stresses

[137]

Note the low plateau characterising Lewis. A loch-studded, boggy plain and the heights of the Forest of N. Harris (and Uig) divide inhabited Lewis from inhabited Harris.

The truncation of capes by storm waves and the drifted bars across minor bays partly restore the generally rectilinear trends of the coast lines, fretted by sea lochs (drowned valleys).

CHAPTER II

THE SEASONS, PLANT LIFE AND THE CROFTERS' YEAR

(A) CLIMATE, WEATHER AND ANNUAL RHYTHM

132 THE Island climate is 'mild' or 'cool temperate', without strong contrasts of heat and cold in summer and winter, but subject to much wind.[1] Fig. 5 shows how, from October till May, the mean monthly temperatures lie between 40° and 50° F.; and only in July and August do they rise to 55° F. This 'lag' in temperatures tends to make the crops late and brings oats to harvest in September, which has the same mean monthly temperature (51° F.) as June, but nearly twice its rainfall (4 ins.). The total sunshine hours for August average only 130, compared with nearly 150 for July, so that late hay is slow to dry (Fig. 6). These averages characterise the more inhabited areas; among the hills of North Harris rainfall is higher.

Cloudiness is characteristic, the total of bright sunshine being only 30 per cent of the possible even at Stornoway. The annual rainfall of Stornoway is 50 ins. per annum; that at the Butt, recorded as 40 ins., must be rather more than this, as a rain gauge on so windy a site may fail to catch rain driven horizontally in a gale. The rainfall

[131] [1] The latitude of the Island is approximately 57° 40′ to 58° 40′ N., and the longitude 6° to 7° W.

feet. These marshy grass moors, with their mountain pastures above, are the adopted home of the hardy Black-

CHAPTER FOUR

THE ATLANTIC COAST

(Brenish, Islivig, and Mangersta)

by

Pamela M. Gough.

131 Brenish, Islivig and Mangersta are situated in the extreme south-west of Lewis, on the Atlantic coast of the parish of Uig and forty miles from Stornoway.

133 Brenish has a south-westerly aspect whilst Islivick faces north-west; in both the elevation of the crofts decreases seawards from about 125 ft. in the east to 50 - 25 ft. in the west. Only one croft in Islivig, and the eight most southerly crofts in Brenish, run to the sea - the rest obtain some shelter from a line of low hills about 300 yards wide and rising to a little over 100 feet, which forms their western boundary. The land terminates in low cliffs from 25' - 100' in height, and a rocky foreshore. Behind these townships to the east a range of mountains from 1,500' - 1,800' in height and dominated by the highest hill in Lewis, Mealisval, (1,885'), gives protection from easterly influences.

Mangersta lies to the north of these mountains; here the crofts lie in a sheltered
134 valley to the west of which the land rises to over 200 feet. The valley opens southwards to the sea where there is a sandy beach and machair. The crofts range from about 150 feet to 100 feet above sea level; those nearest the sea have soils which contain a substantial proportion of machair sand.

Soils are generally deep, and there are few rocky outcrops on the crofts which are fairly level. In Brenish and Islivig the soils are mainly peaty, becoming wetter in the west. Where visible the sub-soil is gravel or stony boulder clay. In Mangersta the transition from peaty soils on the northern crofts to sandy soils on the southern crofts, is marked by the increasingly continuous cultivation, drains being unneccessary on the latter.

137 There are no trees or shrubs, and vegetation consists of marshy grass moors in the Mealasta area with a considerable amount of cotton grass bog further north. West and south of Mangersta the machair area is characterised by a calceole plant community similar in content to that found in many parts of the chalk and limestone areas of England.

361 Brenish and Islivig are old settlements, never cleared. In both, the sites of the
[172] original clachans can still be seen clustered around the mouths of their respective streams. The houses are now situated at the east end of the crofts, near to the road.

175 To the south, Mealasta - cleared in the 1840's to make a sheep farm - was divided in
632 1921 to give enlargements to the common grazings of both Brenish and Mangersta. The
311 arable land was divided into twenty-nine shares as enlargements to Brenish crofts, and is held in a modified form of runrig.

Mangersta was cleared in 1837 to make a farm; subsequently fishermen-cottars settled on the farm but they moved to Dun Carloway in 1873. In 1910, however, a new township of thirteen crofts was set up by the Congested Districts Board; the new settlers were cottars, mainly from Brenish.

the crofts is by no means realised.

CHAPTER SIX

AIRD

by

Madge Phillips.

of Aird is an isolated and old-established crofting settlement along
steep and narrow valley of the Amhuinn Gil na h-Airde three miles
ter leaving Loch Meacheit, the river flows northward through a
which are the ruins of the old corn-mill), then across a narrow
y bay of Camus na h-Airde. The crofts, roughly fan-shaped in
g in size from 3½ to 7 acres, each originally included a narrow
stretching across from just beyond the right bank of the river, up
bove the left bank and widening out over the more gently slopes
200 ft. contours. A number of the crofts were subsequently en-
nd on the right bank of the stream, whilst others received additional
outh.

(facing p.34) and 17 (facing p.39)--Analyst]

511 It is obvious that crofting no longer affords a livelihood in Aird; the only two fa
464 without ancillary occupations are those where all the members are elderly. Of the
288 with members in the working age-groups, five have one or more members employed
civilian capacity at the R.A.F. station and there are five regular weavers.

621 Aird used to be a self-contained community; the land was fully cultivated and a c
178 amount of fishing was carried on in spite of the difficulty of drawing up the boats ove
rocky beach. Now it is prosperous, but very much dependent on the R.A.F. statio
if this should ever close down, most of the younger people would have to leave in sea
other employment.

CHAPTER SEVEN

VALTOS, KNEEP AND REEF

by

David G. Symes.

131 On the eastern side of the Aird peninsula, facing east to Loch Roag is a secondary
133 peninsula of more moderate, but none-the-less broken relief. This, together with an
adjacent area of the main peninsula, the islands of Pabay, Vacsay, Vula Mor and se
smaller islands, comprises the territorial limits of the townships of Valtos, Kneep an
Reef.

133 This secondary peninsula is accidented in the extreme, with outcrops of bare rock
steeply angled small hills. The relief is greater in the west (summit 450') than in the
east (summit 275'). Relatively level land is to be found only on the machairs of Reef
133 Cliff (the latter only poorly developed) and on the glebe at Uigean. The Reef machair,
134 about 180 acres, consists of a succession landwards of tidal sands, a belt of sand dune
(c. 20' O.D.) and a sandy plain sloping gently inland towards a reed filled lagoon. Th
machair at Cliff is approximately 40 acres in extent; here there are fixed dunes and,
addition, the sand has been blown inland to at least 100 ft. O.D. Except where the ma
sand has drifted upslope to produce a "brown machair" of mixed sand and peat, the thin
soils of the Valtos peninsula are predominantly peaty. Although the length of the pen-
insula faces north the extremes of Atlantic weather are moderated by the protection aff
by the Aird peninsula and the islands of Pabay and Vacsay.

175 In the period before the lotting of crofts the whole peninsula was occupied by some f
429 clachans - Valtos, Cliff, Kneep, Uigean and Reef - some of which shared common pastu
361 During the early part of the nineteenth century and earlier, apparently, than the 1850 lo
633 carried out in most of Lewis, crofts were allotted in each of the clachan areas: Valtos
Cliff shared a common pasture and so became one township; similarly Kneep and Uigea
were combined.

175 In Kneep it seems that the croft boundaries were not accepted by the crofters. Cert
311 basic divisions between groups of crofts (usually three in number) are discernable today
427 and within these basic divisions a certain regularity of distribution of strips persists, b

[Seaforthhead]

161 Table XVII reinforces the idea that there is a striking dichotomy between the agricultural
162 and fishing townships. The former are characterised by a more stable population trend,
166 significantly fewer of the population in permanent employment furth of Park, and a smaller loss by
167 migration. In the fishing townships, where growth and decline have been equally meteoric,
241 there is a larger proportion of persons in permanent employment furth of Park, and migration
255 losses have been greater. It is also significant that there is a smaller natural increase of
552 0.5 per cent in the agricultural townships. The only township which shows a natural decrease over this period is Calbost, one of the fishing townships.

SEAFORTHHEAD AND SHIELDERNISH

Rachel A. Hirst

131 Seaforthhead and Shieldernish are separated by 4,485 acres of rough grazing, the former lying on the northern shore of Loch Seaforth and the latter on the southern shore of Loch Erisort.

SEAFORTHHEAD

135 Seaforthhead, the most isolated of all the Park townships, consists of three crofts and a
361 gamekeeper's holding. The township boundary is situated between the 50 and 75 foot contours which at their furthest extent are only 150 yards from the shore. Immediately behind the road the land rises very steeply in rough uncultivable moorland covered with many boulders but generally below the road the land slopes gently at about 5-10 degrees, in places being
[247] completely flat. Here, however, the lazy-beds are very boggy and rushes have appeared in the ten years since cultivation ceased.

134 The soils are deep near the shore due to soil creep; higher up they are very thin and peat
157 accumulates to at least 3 feet both below and above the road. There is little cover; bracken is rare, but silverweed and heather, moorland sedges and grasses soon colonise disused lazy-beds.

241 Legally there are three crofts but only one is still cropped, the other two being used solely
[233] for grazing. There is, however, a gamekeeper's holding within the township boundary worked as a croft. The other two crofts are used as ancillary grazings to holdings in Airidhvruach and Balalian and have not been lived on for forty years and ten years respectively.

[244] The chief crops are oats and potatoes, though the gamekeeper had a patch of turnips and the other croft had grown them during the last few years until 'finger and toe' developed.
[407] Patches, about half an acre in extent, are drained with stone drains and ploughed by tractor, after which potatoes are grown to clean the soil, followed by oats for one year and then sown hay for three to four years. This is not strictly adhered to and several lazy-beds appeared to be
[314] in natural hay. There is no peat-cutting on the crofts as peat is secured just outside the township fence on the common pasture. Lambing has been poor for the past two years being
[251] only 50 per cent in 1958; the stock carried is twice the sheep scum. The cattle, Highland and Ayrshire or Shorthorn crosses, are below the scum, but previously nine cows and followers have been kept.

161 There has been a great decrease in population and cultivation since the resettlement in
162 1886. In Seaforthhead and Shieldernish as a whole, there were twelve crofters before the
241
178

[Seaforthhead] [Shieldernish] [Habost]

161 suppression of the original townships opposed to six today. As a result, many lazy-beds, now
162 given over to natural grass, are being gradually encroached on by heather and juncus. Out of the present population of twenty-three, one is permanently away and two have migrated
241 since 1939. There is a more healthy population structure, with a large number of males
178 between 15 and 44, due to a large family having returned home and six children, five of school age.

361 In Seaforthhead and Shieldernish all settlement is below the road and house-sites are on
[349] slight elevations. At Seaforthhead is the reputed hunting lodge of the Seaforth's, 'Seaforth Castle',
505 now ruined, but still showing signs of abnormal size and arrangement. When first settled,
491 communication was by ferry (1820). Now a cart-track, deeply rutted, to Eisken Lodge gives
[378] access to the Tarbert-Stornoway road two-and-a-half miles away.

SHIELDERNISH

131 Shieldernish, also consisting of three crofts, is better situated on the Park and South Lochs
361 road. The three houses are situated on a well-drained northerly slope, half-way between the
532 road and the shore, but the three crofts are on better land and greater accessibility has led to better management and new ideas.

241 Cultivation in isolated patches reaches up to nearly 100 feet and the lazy-beds have been put
511 together to permit ploughing by horse or tractor. One croft grows neither oats nor potatoes,
[246] preferring to enclose two one-acre parks, re-seed them, cut the hay in June, and wean the
[231] lambs on the aftermath. By next year, this crofter hopes to have enclosed and re-seeded a further acre and will then use the three in rotation. The other two crofts grow both oats and
[244] potatoes and one is also sowing down. The crofts average fourteen acres in size but although gentle slopes are extensive, the major part of the crofts is in permanent pasture. The total
[226] stocking of the Shieldernish crofts is below the souming. Fishing is now only for domestic use
[288] though there is a small jetty on No. 1. Part-time weaving is performed on two of the six crofts.

The future pattern would appear to progress to more grazing and less cultivation. Two out of the six crofts - both at Seaforthhead - are worked from outside the township and this isolated township, being difficult of access and having little cultivable land, is better suited to grazing. Shieldernish appears more suitable for enclosing parks for fattening lambs, as soils are deeper and slopes gentler, making the use of a tractor feasible. More could be got out of the crofts especially with fertilising and re-seeding for hay and pasture and growing
[185] fodder crops for wintering. It is hoped to fence the common securely, and then stock will be renewed - a great necessity. Daily communication with Stornoway also means that Shieldernish is better placed than Seaforthhead for a flourishing settlement. The crofts are certainly of a workable size - provided part-time work, such as weaving, is maintained, along with the grants from the Crofter's Commission.

HABOST

Rachel A. Hirst

151 Habost is scattered around a small bay on the south shore of Loch Erisort. Settlement
133 stretches for over a mile encroaching on three small hills separated by wide, well-drained
241 valleys which soon rise to the dominating Craigeal (225 feet). Slopes are varied but tend to flatten out at about 100 feet near the road and on this flat, most of the cultivation takes place.
361 Nearer the shore, slopes are much steeper and on the hills there are bare rock faces and thin
[154] soils.

[Habost] [Kershader]

464 Of the 53 residents, 19 are over 65 and only 5 under 15 years, leaving a working population
161 of 29: seven are in permanent employment elsewhere. The population has been steadily
162 declining since its peak of 121 in 1901.
166
167

178 Since 1946, the township has changed considerably. It has been completely fenced and the
241 method of cultivation has changed from spade and horse-plough to tractor and cultivators. A further fence has been erected for a lamb park and much land has been re-seeded; an increasin
281 area has been put down to hay. It would seem that fattening of stock for market is intended, an
[407] better attention is being paid to stock. Yet the population is ageing and there are few young men
[162] to take the place of the older crofters; when working units become larger and stock decreases t a figure nearer the real carrying capacity of the grazing, the croft could become a profitable concern: at the moment, the croft is only maintained through grants and ancillary earnings. Should that happen, however, there must be more re-seeding and an increase of cultivation to p vide winter fodder.

KERSHADER

Philip W. Wheeler, M.A.

131 Kershader is a township of forty-three permanent residents on thirteen crofts, which stretc
161 for a mile along the southern shore of Loch Erisort. The crofts extend up to one-third of a
162 mile from the coast with a two-and-a-half mile deep hinterland of common grazing. The extrem
133 elevation is 270 feet and the average from 125 feet to 175 feet, but the crofts, mostly arranged
361 in rectangular strips at right angles to the coast, are lower (maximum 125 feet) and include three main zones (Fig. 8):
241
134 (a) From the low cliffs of the shore to the road, approximately, a zone mainly below 50 fee
361 dissected by four rejuvenated valleys. The soils of the greater part of this zone have a distinctive profile and tend to be moderately heavy, wet, and unsuited to fertilisation by seaware. The smaller hillocks in this zone have thinner soils of the same sort, but the main hill (crofts 10/11) is an extension of zone (c).

(b) A zone between 50 feet and 75 feet with hills rising to over 100 feet. The lower areas have varied soils, easily fertilised, and intermediate in type between those of (a) and (b), with peaty-loam characteristics, overlying aquiferous gravels. The higher areas have thinner soils of the same kind with poor grassy pasture; in places there are signs of former skinning.

(c) A zone of hollows with deep moss soils requiring intensive drainage and reacting well to heavy fertilisation with seaware and intervening heights covered with blanket bog, partly skinned, heather and grass. This zone passes into the common grazing.

Crofts 10, 11 and 12, irregular in disposition, have a steep coast line with gentler slopes over 50 feet; crofts 2 to 8, steep slopes in parts of zone (b), and crofts 1 and 9, again of irregular shape, are intermediate (Fig. 5).

241 In Kershader, there are thirteen legal crofts and twelve operative units. The crofts vary but-
511 ween 4.4 and 18 acres, with a maximum of 3 acres reputed arable. In all, there are 23.45 acres reputed arable and 110.35 acres outrun. 24.5 acres are in fact under crop (oats 18.5, potatoes 6.0), and 9.5 acres under sown grass; and of the remaining 99.8 acres, mainly natural grass

[Kershader] [Garyvard]

182 common grazings - at present approximately correctly stocked - and cannot therefore provide
241 much employment. Hence it is the standard of agriculture that must be improved. Since the
[215] land does not permit striking extension or improvement of the cultivated area, development
must be directed towards improving pasture, with more re-seeding and controlled grazing
000 similar to that already described. All this, however, is of little avail if prices for cattle, sheep and wool remain low, or at least lower than prices prevailing on the mainland. The first priority, therefore, in the establishment of a prosperous agriculture is a guaranteed market-price. Given this, it might become worthwhile to take steps to increase the carrying capacity of the crofts. It may be assumed that this would involve an all-round improvement which could give a firm basis to the economic existence of the community; until this is achieved, stability and continuity are out of the question.

GARYVARD

Gwenyth R. Page, B. A.

131 The landscape of the south-east coast of Loch Eriseort is a sombre and rugged one. The
133 Quaternary ice sheets left in their wake troughs now filled by the sea loch, innumerable lochs covered in water lilies, a massive area of indeterminate drainage and expanses of bare gneiss.

Garyvard is set on the fringe of this landscape on a 20 to 25° slope with the crofts aligned
[551] from the moor to the sea, on a mantle of drift. Here is the home of the MacLeods, the Mackinnons
121 and the Montgomerys. Life beats out its regular pattern of existence during the winter months
251 on the croft, followed by an increasing tempo and variety of work during the rest of the year. In
241 January and February the animals must be fed on hay or lose the battle to survive. In February there are preparations for the year's tasks, making repairs and improvements to the croft. Next month will find the crofter on the land, making or clearing drains and putting fences and dykes in order. The tempo of life quickens with the year; April sees the first sheep dipping, the land turned over, potatoes and oats sown. From mid-May, the sheep leave the crofts to fend
[314] for themselves on the common grazing. The following three or four months are times of tremendous activity on the moors when the peats are cut, to be stacke later, first in fours, then in eights, so that the wind may dry them, till eventually bee-hive-shaped stacks - some four feet high - can be seen near the peat banks in August. Then begins the wearisome task of carrying the peats home, all too frequently in creels carried on the back, since the peat workings of Garyvard are on the moors up to half a mile from road. Altogether some two miles of roads are needed to prevent the villagers patronising the coal merchants of Stornoway. Two crofters, however, cut peat on their crofts, whilst others have permission to cut from Cromore or Caversta common grazings close to the road. All the while croft work continues, varying from hoeing, weeding and cutting hay to the gathering of sheep for shearing. As there are no fences between the various commons, crofters must travel from one township fank to another, seeking their own. In August the lambs are weaned. Hay making generally ends in August and is immediately followed by the oat harvest in September. By the time both oats and hay have been gathered in, the potatoes are lifted and the sheep are brought in from the common grazing about October 12th. The last sheep dipping takes place in November and is followed by tupping.

241 There are eleven crofts altogether, though one is divided, each portion having a legal tenant
423 who has a half share in the common grazing. Two crofts are 12 acres in extent, the half crofts 2.75 acres only, though the acre cultivated on the common grazing by one of the latter crofters since 1923, has recently been officially recognized. Most crofts are in strips running from the sea-shore up the slope some 500 yards to the township dyke, and are clearly demarcated by fences erected just after the last war. Three crofts have additional strips whilst one croft was an extra strip belonging to another croft. The additional strips date back about 100 years to a
[195] time when the township grew rapidly as a result of evictions in southern Park. One croft is divided and worked in three separate parts so in effect there are fourteen operative units in Garyvard.

[Caversta] [Cromore]

161 The 1914-18 war had a marked effect on the Caversta population - 16 out of 54 (29 per cent) left after
162 1911 and no re-population took place. Since 1939, seven people have migrated to Stornoway or the
166 mainland, (16 per cent of the total 1939 population), and six of these were from Torista (i.e. 50
167 per cent of the 1939 Torista population); only one family now remains there. The demographic position is becoming more acute for there are no young married couples and no youngsters growing
[466] up. The girls have left to marry and most of the men have sought temporary or permanent employment elsewhere, for with better communications, education and the radio, the pull to the towns has become stronger. There are now only two people in the township who could be described as full-time crofters, earning no supplementary income by weaving tweed on commission from the Stornoway mills.

241 Caversta is not one of the most progressive of the South Lochs townships. Although the crofts
233 are fenced, the common pasture is not visibly delimited from either the Cromore or Garyvard
632 pastures. At present, the grazing is fully stocked according to the soum, but the committee has not as yet initiated any re-seeding schemes. As the pasture is not of the best quality, some newly sown grass would benefit every crofter. Lack of manpower may in part account for this deficiency but even a small acreage of re-seeding would be a great asset.

000 The future position of the township is rather doubtful: it is not the best type of land for mechanisation and is badly served by communications. The future of Torista appears to be probably one of abandonment, unless it is more easily linked with Cromore. The possibility of a good road being built here is remote, as there is only one family to serve. The main part of Caversta is also open to question. Amalgamation of the crofts would not necessarily make more efficient units for the present units are not used to their full extent. Amalgamation with Garyvard might benefit the township a great deal, as the Caversta population is rather small to flourish in isolation. The future of Garyvard, Kershader and Habost is one of hope, but unless some change takes place soon, it is not difficult to see Caversta, and Torista, following the same course as Calbost and in thirty to forty years being little more than grazing land.

CROMORE

G. Mary Swindell, B. A., and Dennis F. Fancett, B. A.

131 Cromore is situated on a peninsula between Loch Eriseort and Loch Cromore. Approaching it
561 from the access road, Cromore has the appearance of a nucleated settlement, but in fact each house is situated on the owner's croft. The crofts are so arranged that each has a portion of land on the more level surface of drift deposits; houses 1 to 20 stand at the junction of the drift and the
134 Lewisian gneiss. Soils are poor and thin, and there are numerous outcrops of barren rock amongst
137 the arable land. The natural vegetation is heather moorland with extensive patches of rushes and cotton grass, the pattern of most of the 'outrun' around Cromore.

The township comprises twenty-seven crofts and there are twenty-seven working units; two
241 crofts are subdivided while another four form double crofts. In addition there are five cottars and
632 the Schoolhouse feu. Outside the township dyke there are two feus and four squatters. The croft layout differs from most other townships as each croft is in four non-adjacent pieces, one piece around the house, another above Creag Cromore and two pieces on another area of enclosed land on the common. Two crofts on the eastern side of Loch Cromore, have most of their arable land around the croft-house while three crofts have only one share in the other area of enclosed land.

241 Until this decade all the land around the houses, and much of that above Creag Cromore, was
611 regularly cultivated. Some of the lazy-beds on the higher land are being cut for hay this year but cultivation is limited to the land around the croft houses and is completely unmechanised. The only
[244] crops at present are oats and potatoes and these are usually grown in rotation. The crofters sowed
[246]

[Cromore] [Marivig]

366 butchers' vans call on Wednesday and Friday and a fish van once or twice during the week. Go
[434] are also conveyed by the daily bus. Electricity was brought to the village about four years ago
[437] and the inhabitants now look forward to a supply of piped water in about two years' time. At pr
[312] only three or four houses have bathrooms.

241 The crofts, when worked well, are good enough to provide the existing population with a sat
434 factory subsistence, but each family unit must have some additional source of income. It seem
[228] that the recent subsidies for fishing are good enough to attract fishermen from Cromore and on
288 two boats might be sent out from the bay if the quay were longer. Weaving has brought prosper but, as the Park Association states in its Second Progress Report "there is not sufficient weavi available for the present number of weavers". The proposal to establish a spinning and proces plant in the Park District made in the 1957 Report, would undoubtedly be of great value to the
000 people of Cromore. The village is sited in a most picturesque spot and one of the inhabitants suggested that a hotel built on Crobeg Farm would bring some benefit to the community. Howev even if these three increased sources of income became effective, one wonders whether they w be sufficient to attract the younger generation, already urbanised by schooldays spent in Storno

MARIVIG

Pamela Gough, B. A.

131 Marivig is situated on the western and south-eastern sides of Loch Marivig, a small triang sea loch opening to the north-east and sheltered from storms and swells by Torray Island, mak the loch an ideal anchorage and harbour.

133 The land rises steeply from the shore of the loch for twenty-five feet to fifty feet, then slope more gradually and irregularly, with frequent precipitous rock outcrops, for two hundred to five hundred yards to rise steeply to a line of low hills, two hundred and fifty feet to three hund feet high, surrounding the loch. All crofts thus have an easterly or north-easterly aspect not particularly favourable for agriculture, and only one has any appreciable area of level
134 uninterrupted by rock outcrops. Soils, derived from glacial drift, are unevenly dis thi and very stony, and cultivable areas are thus small and widely dispersed.

137 The surrounding hills, which form part of the eight hundred and sixty-three acre of commo grazing, are mainly covered with heather, moor grass or sphagnum bog, while the lower areas within the township are grassy, but drainage is poor, and rushes are widespread. Bracken is n yet a problem, and only small areas exist, mainly on the lower slopes of the western side of the loch. A few rowans and willows survive here also, but otherwise the area is devoid of cover.

241 There are twenty-four registered crofts in Marivig, twenty-two being inhabited, one vacant
632 and worked by another crofter, and one worked from a house on the common. With the exceptio of two crofts, one of which is on the common, all the boundaries run from the township dyke, wh closely follows the two hundred foot contour, to the sea in radial fashion (Fig. 4). The size of the cro varies from 1.25 acres to 22.25 acres but only seven crofts and less than four or more than eig acres in size. No croft has more than three acres of land which has ever been cultivated, and few now cultivate more than one acre. There are thirteen cottars and squatters, five houses be on the common, three of them cultivating small areas adjacent to their houses.

241 Cultivation is exclusively by spade on the 'lazy-bed' system. Owing to the rocky nature of th
[244] terrain, the 'lazy-beds' are narrow, often only one or two yards wide. Potatoes and oats are
[246] grown in rotation, and hay taken from lazy beds left fallow. Very few crofters sow grass for ha
237 or undersow their crops. Dung and seaweed are used as fertilisers, with potato fertiliser as the
[324] most general 'artificial'. Small enclosed gardens, often somewhat neglected, produce lettuce, carrots, cabbage and soft fruits on about half the crofts, but no garden produce is marketed.

[Marivig] [Calbost]

000 In conclusion, it may be said that the problem of Marivig's future, and that of other crofting townships, is not only one of adverse aspect, soil and weather conditions, and of distance from markets, but a problem of the population finding a stable and viable level where agricultural units are large enough to encourage the active and enterprising section of the population to remain, and a problem of finding capital to equip a modern fishing fleet.

CALBOST

Anne Cooper

131 Calbost is situated five miles to the north-east of Gravir on the Minch coast of Park. It occupies
133 a basin-like hollow in the centre of which is Loch Dubh, and is open to the sea on the east. The
361 croft houses are scattered over a shelf 50 feet above sea-level round the sides of the hollow and along the valleys which enter the township to the north and south-west.

134 The cultivable soil, a mixture of peat and well-drained gravelly drift, is on the higher ground,
137 although here the rock outcrops in many places. On land formerly cultivated, bracken is spreading rapidly and now covers a large proportion of the surface, although twenty to thirty years ago it was unknown. Heather dominates the common pasture and rushes are widespread in the low-lying central area. There are a few willows and rowans round the old buildings, probably planted as wind-breaks.

195 Calbost was originally a single farm but the township was formed about 1820. The pattern of
241 the crofts differs from the usual shore-to-dyke alignment, as six crofts were allotted extra land
311 in the valley which enters from the north, when a part of the common grazing was brought within
361 the township dyke. There are now fourteen crofts of which four are worked by resident crofters
[189] and two by squatters. The remainder are used only for hay and grazing and are sub-let to crofters in Calbost and other townships.

241 Cultivation is entirely by spade and of the 2.6 acres now in cultivation, potatoes account for
[244] 2.37 acres. The small acreage of oats reflects the greatly reduced cattle stock of only two cows and
[246] two calves. Approximately twelve acres of hay are cut as winter feed for the 225 sheep which graze in the township.

311 The lazy-beds in natural hay and the outrun are being rapidly encroached on by bracken. The prevalence of bracken, and the amount of work needed to clear it, is likely to deter any attempt at renewed cultivation.

198 Calbost was originally a fishing township in spite of its harbour being so exposed: boats have to
228 be taken up on the shore instead of being moored in the bay. The decline of the fishing industry whic
504 has prevailed in Lewis has contributed towards the almost complete desertion of Calbost, leaving
434 only a few boats now used only for leisure purposes. Croft income is supplemented by only two of
563 the men in the township, one a weaver and the other in the Merchant Navy. Although there are a few productive gardens, no attempt is made to market any produce.

233 The township dyke is very close to the settlement and in the past shielings were not so widely use
361 in Calbost as elsewhere. The cattle were instead brought near to the dyke for milking and allowed
449 to graze on the common unattended. There are ruins of shielings to be found on the hills around Calbost but a more interesting feature is the second dyke; enclosures were made adjoining the main dyke and in the late summer the cattle were brought to fresh pasture within these dykes before
[178] the opening of the township gates. Following the opening of the gates the stock are free to wander over all crofts but there seems today to be a move towards the complete enclosure of the crofts.

[Calbost] [Gravir] [Glengravir]

161 The present situation in Calbost is best illustrated by reference to the population statistics.
162 There are only 17 people living there at present, seven of whom are squatters and only eight houses are occupied within the dyke. Of the male population, there are three children under fourteen years, one man in the 15-44 age group, three between 45 and 64 years and two over 65. This clearly shows the lack of active men from 15-44 years, necessary for the continuing economic success of
166 the community. However, even these figures are not so striking as the numbers of emigrants as
167 no less than 39 men and 40 women have left Calbost since 1939.

[449] A community of 120 persons has shrunk to less than 20 in only twenty years as the younger
[63] people have left to find employment in Stornoway and on the mainland. The present population structure seems to indicate a continuation of the downward trend.

GRAVIR AND GLENGRAVIR

131 Gravir, the largest Park township numerically in population and crofts, lies astride the major
132 east-west inlet of Loch Ouirn, a glacially modified line of structural weakness. The site of the township is perhaps the most picturesque in all Park, but the steep slopes, lack of cover, the small area of good arable land, and the considerable population existing on slim resources, problems common to Park as a whole, are all epitomised in Gravir.

361 On the south-facing-slope above the loch and the continuation of the trough in the valley to the
241 west, the majority of the crofts have been carved from moor to sea, some before 1800, and some
195 in the process of the abolition of run-rig which was accomplished in the years 1850 to 1852.
78 Originally, there appears to have been thirty crofts, but four were added during the nineteenth century, two at each end of the line, and in 1934 a further fifteen were cut out of the common grazing, a mile to the west of Gravir. On the south side of the loch, the 'clachan' of Tom an Fhuadain, established about 1800, has since developed into a further nine crofts. Thus there are forty-three legal crofts in Gravir and a further fifteen in Glengravir making fifty-eight in all.

The layout of Glengravir, a line of crofts from 3.6 to five acres, typifies the small post-1918 Department of Agriculture holdings. The arrangement of the Gravir crofts is illustrated in Figure 8, and it will be seen that not all the crofts are consolidated. There are three areas of former arable commons which have been lotted in unfenced strips and they may well be reclamations which were necessary to supplement the food producing capacity of the holdings. The method of division and allocation speaks of a period when a subsistence economy under severe pressure from over-population, necessitated fair shares for all. The last of these commons was in cultivation until 1891. Although subsistence crofting has been obsolete since then, there is as yet no move towards a regularisation of the layout.

178 The congestion which necessitated the reclamation of the arable commons developed mainly
195 as a result of a successful fishing industry which prospered from 1860 to 1914 and at one time there
228 were two curing stations in Gravir. With relative prosperity from an ancillary industry, cottars
[181] were tolerated and the population rose from 197 in 1830, to 368 in 1881 reaching a peak of 468
[262] in 1911. The collapse of the industry after 1914 began the downward trend which has certainly not yet ceased. Gravir reverted from 1918 to a township of agriculturalists and a base for employment furth of Lewis, although there have been spasms of successful fishing activity since.

241 Stock raising is now the function of the township and the agricultural resources and conditions
[231] are hardly conducive to the development of economic holdings. The Gravir and Glengravir crofts vary between 3.5 and 26.5 acres in size: no croft has more than four acres of 'old arable'. In the days of subsistence agriculture, and indeed until the 1930's, cultivation, all in narrow lazy-beds, banked up with stones at the downward extremity on the steep slopes, was much more extensive.
[324] All the cultivable land was at one time under crop, heavily manured with seaweed cut as far away as
[137] Cromore or the coast south of Kebock Head. About one-third of the maximum lazy-bed area is now cropped and the more inaccessible areas of the crofts have reverted to pasture; some of the lazy-

[Gravir] [Glenbgravir] [Lemreway]

The urgent need in Gravir is a reduction in the number of holdings. A pre-requisite of such reorganisation would be the creation of employment for a non-crofting population. Weaving and fishing are the more obvious occupations; the former is subject to world trade fluctuations but the latter is now in a more favourable position since the introduction of the herring fishing guaranteed subsidy, although the raising of the initial capital for buying and equipping boats is a formidable problem. It is clear that a division of the community into a crofting and non-crofting sector is essential if the present population level is to be maintained. The most serious aspect of the present trend is that the migrating section of the community comprises the younger and more enterprising people. Unless holdings of economic size can be formed, and stable employment introduced, one can expect the younger men and women to remain in Gravir.

Until a major reorganisation of the crofts is carried out, a vigorous attempt to re-seed large areas of the common pasture and the three former arable commons, and the development of a croft-tourist industry, are interim possibilities. It is not sufficiently realised in crofting districts that there is a demand from the city dweller for simple accommodation and good plain fare in a clean atmosphere, with the possibility of hill walking and fishing on fresh and salt water. Yet, until the proposed water-scheme becomes a reality, tourism on a moderate scale can hardly be contemplated.

One can only conclude that until reorganisation takes place and transforms Gravir into a township of viable agricultural holdings, any stabilisation of the present trends is out of the question. A decline in the number of holdings is inevitable in the long run but a planned reduction over a number of years would bring about a more viable community than the disintegration which will occur without such planning. Until this is achieved, the young men and women have little incentive to remain in Gravir.

LEMREWAY

Beth Blowers, Brenda G. Turner
and John E. Wearmouth

Lemreway, the southernmost township of Park, comprises 290 acres arable and outrun divided into thirty-three crofts and 3,025 acres of common pasture. The township is situated on the northern side of Loch Shell round a bay in the shelter of Eilean Iuvard.

The township consists of three distinct areas. A flat, poorly drained area at about 100 feet, part common pasture and part reclaimed as extensions to the crofts, locally known as 'the Outend', forms the first subdivision. The second area, further west, is of a hummocky nature. To the east, a steep slope rises to an altitude of 400 feet, less than half a mile from the loch shore, forming the third. Two benches are to be seen at about 100 feet on the steeper slope and similar, though wider terraces occur at the same height to the north. It is suggested that the flat area is the bed of a moraine-dammed lake, and that the hummocky sector is partly morainic and partly ice-eroded rock exposure. A channel eroded through this sector allowed the lake to drain southwards leaving a relatively deeply incised valley through which the present stream flows to the sea.

Soils may be divided into two types - a peaty loam and the better drained gravelly loam which is found to the east and along the main stream; the latter is particularly suitable for potato cultivation.

Except on rocky outcrops, the very steep slopes and the drained areas, blanket bog predominates. Sphaghum here is rarely dominant but where the land is badly drained Deer's hair grass (scirpus caespitosus) and cotton grass (Eriophorum vaginatum and Eriophorum angustifolium) are the dominants. On slightly drier land, purple moor grass (Molinia caerulea) and mat grass (nardus stricta) are abundant. Local dominants are bog asphodel (Narthecuim ossifragum) and cross-leaved heather (Erica tetralix) with other common species such as the sundews (Droseera rotundifolia and intermedia), butterwort (Pinguicula vulgaris), Juncus sp., Carex sp. and Carex panicea occurring sporadically. Where the peat has been cut and drained, 'heather moor' usually develops and Calluna

[Lemreway] [Orinsay]

The West Highland Survey Township Card[1] describes Lemreway as "predominantly a fishing township". The remains of an old curing station are visible today and until 1947 there were twelve boats operating from Lemreway. A declining market, increasing cost of gear for obsolescent boats and the lack of a landing stage led to the decline of the industry in this township. Today there is one fishing boat which lands its catch in Stornoway: working with modern equipment, drift and ring nets, it provides a regular income for a crew of six.

An examination of the population statistics proves interesting, especially when compared with those for Orinsay. Lemreway's resident population of just over 70 males and 70 females is large considering that there are six unoccupied crofts. Eleven of the crofts have more than one house and the cottar population forms over a third of the total residents. More than two-thirds of this resident population is in the two important age groups - between 15 and 64. With over forty resident males in the working age group, Lemreway provides a striking contrast to other crofting townships in Park.

Fourteen of these men are full-time croft workers, while nine others find work in ancillary occupations such as weaving and fishing. A further eight supplement their croft work with regular employment - a postmaster and a postman, a bus driver, a lorry driver and several weavers. Just over thirty people work away from the township permanently, fourteen in the Merchant Navy and nine girls in domestic service, while a further nine engage in seasonal work.

Emigration from the township has continued steadily with forty people leaving since 1939. Nevertheless, Lemreway has a larger proportionate resident population than most townships.

Only four thatched houses are occupied and housing conditions generally are good. Every house has electricity, but, with four exceptions, water has to be carried from springs and wells. Most of the present houses were constructed in the 1930s and they are usually near to the road. Ruins of the old houses remain, some being used as byres, and these were built either along the shore or up the slope in the shelter of the hills, where the house was near the sheep, the peat and the springs. Today supplies of food, peat and even seaweed are brought by road.

Mention must be made of the possibilities of the tourist trade in Lemreway with its most attractive situation and reasonable road connections. An approach has been made to the Scottish Youth Hostels Association and while hostellers could not greatly increase the income of the residents, they would stimulate interest in the area. Accommodation for summer visitors, other than relatives of the crofters, is difficult to find but it seems that at least three houses could be used.

It is possible to be optimistic about the future of Lemreway, as at the moment considerable enterprise is being shown. A Ferguson tractor, bought this year by a man returning from whaling, is an example. It is to be hired out and could be put to good use in some parts, especially on the outend. The attempt to improve the common pasture and the new extensions to neatly painted houses all reflect a combined effort to improve conditions. The old economy of crofter-fisherman is being adapted to modern times and crofter-weaver, crofter-postman and crofter-bus driver are the contemporary employment combinations.

The pessimism and apathy noticed in many crofters is to be found in Lemreway but above this is the impression of enterprise. If Lemreway can continue to adapt itself to changing conditions, it may be able to combat the 'drift to Glasgow' and continue as a successful community.

ORINSAY

Beth Blowers, Brenda Turner and John Wearmouth

Orinsay is a small crofting township clustered, in the form of a horseshoe, around the head of a sheltered bay on the northern side of Loch Shell. Most of the houses are situated within fifty yards of the shore on a narrow strip of level land, while the crofts extend from the shore on to the moor.

1. The Directors of the Crofting Survey are grateful to Dr. F. Fraser Darling for granting access to the individual Township Cards, which are a storehouse of information. For detailed contents of the cards, see West Highland Survey p. 247.

CHAPTER NINE

THE ISLAND OF BERNERA AND

ADJACENT DISTRICTS OF THE MAINLAND OF

LEWIS

('Bernera and Bernera Shore')

by

P. Wheeler

131 Of the three main sections of the parish of Uig, the Bernera district, consisting of
103 Bernera Island (Breaclete, Croir, Hacklete, Kirkibost and Tobson) and the "Shore"
(Earshader, Crulivig and Lundale together with the isolated township of Linshader),
presents a number of peculiarities due not primarily to physical conditions, but to isolation.
491 Bernera Island, though central to most of Uig and easily accessible over the sheltered
waters of Loch Roag, yet remained relatively inaccessible overland until the recent
building of the road bridge; even now it is necessary to travel over six miles to get from
181 the bridge to the main Uig road and a further four miles to Garynahine. Consequently
the island, even more than the adjacent mainland settlements, has a very close-knit and
self-sufficing population. Whether this community retains sufficient vitality to resist
the destructive effect of better communications in addition to the general forces eroding
rural and especially Highland life, remains to be seen.

13 The district shares the unpropitious physical characteristics described in the Intro-
228 duction. Like the other districts it has virtually no valuable mineral resources (1), and
171 the herring and white fish industries have all but disappeared and seem unlikely to
464 resuscitated. Lobster fishing is, however, prosecuted with vigour and enterprise; it
provides a good living but only for a small group of families. The rest depend on
regular or casual employment to eke out the proceeds of the croft. The kinds of work
164 available, and the problems of permanent or seasonal absence in search of employment
are common to the whole parish; thus this account is mainly concerned with the problems
of crofting agriculture.

Settlement: history and patterns.

172 The pattern of settlement in this inhospitable and discouraging environment is partly
very old, and partly very recent. At least four brochs are known on Bernera and various
361 standing stones of even earlier date, while continuous settlement has survived from the
early Christian era. Traces of old patterns and practices remain, in tangible form as
175 in the graveyard on little Bernera, or in oral tradition. All this contributes towards the
very close network of family relationships that binds the island folk and to a lesser extent
those of the adjacent mainland.

175 With the exceptions of Tobson, Bosta and Breaclete, all Bernera Island had been
361 cleared by 1851. Resettlement began in 1878 when twelve families were moved from
Bosta to Kirkibost, and continued at Hacklete in 1880, and subsequently elsewhere.
Occasionally (as at Kirkibost) old, pre-clearance lotting patterns were re-adopted, but
usually settlement was laid out afresh. The townships of Bernera Shore, were also
affected: all the small tenants except those of Earshader and Crulivig were cleared,
leaving the land under the sheep farms of West Earshader and Linshader. However, the
Bernera Island crofters were allowed to continue their customary use of sheilings on the
mainland, and the transfer in 1880 of these grazings to their present position marked the

316 (1) A small deposit of diatomite has been exploited in Kirkibost since 1959. Only a few
men are employed and the number is not likely to increase.

CHAPTER TEN

EAST LOCH ROAG DISTRICT

(Garynahine, Callanish, Breasclete, and Tolsta Chaolis)

GARYNAHINE by Anne Iredale and Jennifer Oxenbury.

131 Garynahine is a townships of twelve crofts which are situated on the eastern arm of
632 Loch Ceann Thulabhig. The crofts nowhere extend more than one-third of a mile from
the coast. There is a hinterland of about 1,800 acres of common grazing, which is
133 mostly about 100 ft above sea-level, though it rises to 200 ft in a few isolated areas; the
crofts are lower, and maximum elevation is 80 ft.

Most of the croft land is drained by the stream Allt Mhurchaidh which flows through
134 all but two of the crofts. But the soils are heavy, and several crofters cut peat on their
crofts. Many crofters complained that their land was too peaty for cultivation.

361 The crofts form a regular pattern beside the south side of the main road from
Stornoway to Breasclete, with two small feus and a 21 acre freeholding on the north side
of the road. In addition there is a farm (Garynahine Lodge) of 400 acres east of the
crofts, and likewise stretching along the south side of the Stornoway road. The main
road to Uig passes through the farm, dividing the cultivated area in the west from the
grazing section.

175 The regular lay-out of the crofts dates from the formation of the township in 1935.
361 On the same site, but long cleared, there had been an older village about the same size
i.e. twelve crofts, known to be in existence in the 1850's. The crofts were in a similar
position, but were a different shape, and the ruins of some of the croft houses still remain.
This village was completely burnt out one gusty winter evening when, it is said, a spark
from a crofter's pipe was blown onto one of the thatched roofs, and the wind quickly spread
the blaze to consume the entire village. The crofters left the area, many going to the
neighbouring township of Callanish; Garynahine then became one large farm until 1935
when the land was re-allocated into crofts. The new crofters came from a variety of
areas, several coming from Crulivig, others from Breasclete and Callanish. The
owners of the farm had also opened an hotel which prospered until 1945 when the farm
was sold to its present owner Admiral Drummond, who has since used the house of a
241 private house. Nine acres of the farm land is cultivated, and the remaining 391 acres
311 are used for grazing. In contrast to the usual practice in this area the oats have been
undersown with rye grass. Another beneficial innovation at the farm is the introduction
of shelter belts. Trees have been successfully planted, making it possible to produce
good crops of soft fruits such as raspberries, strawberries etc. Both the crops and
the stock on the farm are of a high standard, showing that with capital and correct
management the land can be remarkably productive.

In contrast to the large scale economy of the farm, the twelve crofts (ten operative
units) are each between 4.6 and 6.2 acres, and the total reputed arable is 67.3 acres.
In all there are only 9.5 acres under crop (oats 6 acres and potatoes 3.5 acres), and
2.25 acres under sown grass. The crofts are worked either by spade, horse (hire from
croft 40 Callanish) or by tractor (hire from the Lodge). The seasonal rhythm of culti-
vation and of stock rearing is that in Callanish.

Enquiries soon reveal that crofting is not the main occupation of the croft tenants.
Another indication of the declining interest in the land is the fencing of the crofts. All
were fenced when they were formed in 1935; since then there has been no refencing.
Now a grant is available to pay 75% of the cost of re-fencing but little has been done.

231 Stock totals (see Appendix C) have declined recently and this trend will probably
continue. There are only four cows and two calves in the township (plus six at the farm).

427 authority, simply moved their fences and enclosed part of the common gr
311 example the crofter at 37, instead of having only the 6.7 acres of the cro

private boats (e.g. Callanish church serves Linshader, and many people
by boat until recently), but gradually it has fallen into disuse.

312 There is no piped water supply and after even a short period of dry weather there is a
[604] water shortage. One prosperous crofter (where the crofter does weaving and one member of the family is periodically away with a Norwegian whaling fleet) bought a large modern Bendix electric washer only to find that there was not sufficient water to use it except on
[359] rare occasions. The croft houses have had electricity since 1954, and even the three remaining inhabited thatched houses now have electricity.

311 Although there are only 4 full-time crofters, most of the crofts are carefully and well worked. Only a few crofts are decaying, and there is a tendency for these to be sub-let to the more agriculturally inclined crofters instead of allowing the land to revert. In
[288] addition to the full-time crofters, 31 other men do part-time crofting. Eighteen men weave and this provides their main income, but this figure fluctuates according to the prosperity of the Harris-Tweed industry; at present the figure is probably higher than
[166] average. Although 32 people have emigrated from the township since 1939 (many of them
[162] young people who have married on the mainland), there are still several young people and young families making their homes here. The dominant age-group of permanently resi-
[162] dent adults is 15 to 44. Total population is steadily declining, but Callanish has always been a prosperous area and seems likely to remain among the more prosperous crofting communities.

BREASCLETE PARK by Margaret Grice and Doreen J. Phillips.

195 Breasclete Park, also known as New Park, Callanish, was settled by people cleared
427 from Reef in the mid 19th century. Two of the six original crofts have been subdivided, making nine. However, there are only five working units and on one there is no cultivation. There is also a feu house built in 1958.

361 The crofts, which are fenced, form broad strips perpendicular to the Breasclete-
241 Callanish road. Cultivation is mainly by tractor, oats, potatoes and some clover being grown. One progressive crofter has successfully experimented with re-seeding one
231 acre of grazing land on his own croft. Common pasture for the 148 sheep and 6 cattle is shared with Callanish, and for most purposes the Park can be considered a part of that township.

162 The total population is 26 of which 4 are permanently away. There are 6 people over 65, and 8 children under 15.

BREASCLETE by Margaret Grice and Doreen J. Phillips.

131 Breasclete is situated on the east side of East Loch Roag on land which rises gently
133 from the seashore to the moorland and is interrupted by rocky outcrops of gneiss in the northern part. It is separated from the township of Callanish to the south, by a small westerly flowing stream, at the mouth of which is the site of a mill.

491 The road on which most of the houses are situated, follows a curve through the
361 middle of the crofts, but newer houses and some feus have been built along the main Callanish-Cartoway road, nearer to the shore. Stornoway is 18 miles away along this road which is turned throughout. Breasclete could be served by the still unfinished Pentland Road, were it to be properly surfaced and this would make the journey shorter
[444] by 4 miles. Two buses in each direction per day connect the township to Stornoway, but high fares make visits to the town infrequent.

312 The township hopes to receive the mains water supply within the next few years, but, at the moment, relies on wells within easy access of most of the houses. Many houses have piped water from private wells, some of which go dry after two or three days good weather although the wells on the lower ground never fail.

Since 1939,
166 54 people have emigrated whereas only 4 have immigrated. Most of the girls have to
462 leave home when they finish school as there is no employment locally. Many of them go into domestic service or nursing in Glasgow. Many of the younger men also spend time away from home, often in the Merchant Navy. Breasclete is also the temporary home of the families of lighthousemen on duty in the Flannan Isles.

288 Although the people live and work on the croft, weaving the Harris Tweed provides the main source of income. This is a rather irregular occupation owing to the uncertain demand for the tweed, and although the men are nominally self-employed they rely on the mills to supply them with work. The tweed is woven on treadle looms which, with ancillary equipment such as bobbin winders, are all owned by the crofters.

[458] As 1959 was a good year for the tweed industry, there was an air of prosperity in the township, and with the aid of government housing grants many new bungalows were being erected. But should there be a slump, the crofts would be unable to support the population and most of the bread-winners will have to leave.

TOLSTA CHAOLAIS by Roger H. Thomas.

131 The township of Tolsta Chaolais lies in a shallow glaciated depression occupied by Loch
133 a' Bhaile and Loch Shader. Most of the crofts are situated near the shore of these lochs, for westwards to the sea the terrain is too rocky and irregular for either settlement or
361 cultivation, whilst to the east of Loch a' Bhaile the land slopes precipitously from 250 ft. to the loch shore. As Figure 36 shows settlement takes advantage of the more gentle drift-covered slopes, generally of small extent.

Cultivation is very noticeably limited to three areas - along the west shore of Loch
137 a' Bhaile, along the north-east shore of Loch Shader, and in the valley of the small stream draining from the north into the head of Loch a' Bhaile. Most of the croft land is com-
[241] posed of rock outcrops, rarely exceeding 100 ft. in height, separated by damp depressions frequently filled by reeds and rushes; bracken was apparent only on three crofts. In particular, the area between the two lochs is badly in need of draining and is largely colonised by reeds and very coarse grasses, of no use whatsoever as pasture. One enterprising person suggested that the township should hire a ditching machine - this could certainly be put to use with great advantage.

632 The settlement comprises 43 registered crofts, 6 feus, 2 squatters, 1 cottar, and
311 2 holiday bungalows, with the croft holdings aligned north-east/south-west between the two lochs and the sea, except for nos. 28 and 29. The 53 holdings are unofficially
427 amalgamated in various ways and so reduced to 35 operative agricultural units. The acreage of crofts varies from 2.2 to 20.75 acres - a considerable variation. Fencing of the crofts - except for 1A, B, and C, and 12A, B, and C which are held 'run-rig' - was carried out between 1945 and 1950, whilst in 1946 the common pasture of 2,700 acres was fenced into two parks - an inner and an outer one, the division coinciding with the Carloway to Breasclete road. An area stretching from crofts 18A to 21 has, however, been most haphazardly divided. The seaward halves of some five crofts were redivided amongst seventeen crofts in the southern half of the township to compensate them for lack of grazing area within their own croft boundaries. This division is said to date from about 1886.

241 Most of the cultivation is carried out with hired tractor, although two crofts owned
[407] small mechanical cultivators. Ploughing by tractor and horse, as opposed to spade cultivation, depends either on the urgency of the operation, or on the accessibility of the plot, for any small patches of cultivation on the rougher terrain are dug by spade, as

[TEXT CONTINUED ON PAGE 95]

full-time crofters; 19 males have other regular employment and two have periodic employment. 8 crofters are aged over 65. It seems that the most successful combination of employment is weaving and crofting; weaving is carried on in twenty of the holdings. Lobster fishing in the evening is still popular but regular small-boat fishing has disappeared: one crofter took up regular fishing when weaving was slack in the autumn of 1958.

Of a resident population of 125, 32 males and 32 females are between the ages of 15 and 64, these representing the effective labour force. Thirteen persons are temporarily away and 16 permanently away whilst at least 46 have emigrated since 1939 and 6 have immigrated. Thus the number that have emigrated is nearly three times the number that are merely permanently away. With a population of 125 and an effective labour force of 64 to work 35 operative units Tolsta Chaolais would seem to be far from a dying township.

If not exactly progressive the township economy seems stable and moderately prosperous, in spite of the fact that the settlement is rather inaccesible, for the roads which join the Carloway-Breasclete road are both very steep and have bad corners. To add to the apparent isolation there is only one Post Office-shop in the village but most commodities are bought from vans. A reallocation of the smaller crofts to younger, more ambitious tenants at the deaths of the older tenants could reduce the number of operative units to about 25. Admittedly, little can be done with the rougher terrain, and although cattle stocks could be increased there would be the added problem of sufficient winter feed. With better drainage more land could be taken into cultivation - especially between the two lochs, an area largely wasted at the moment - whilst weaving might supply a surer source of income, especially in the winter. Tourism on a small scale might be a further possibility for the coastal scenery is very fine and the immediate setting of the village is very attractive. It would be more realistic however for Tolsta Chaolais to find future prosperity within its own boundaries.

CHAPTER ELEVEN

THE CARLOWAY DISTRICT

by

Brian Loughbrough

ftting townships of Upper Carloway, (including Carloway Park), Borrowston, arloway, Dun Carloway and Kirivick form a compact area of land in the h of Uig bordering the coast and Loch Carloway. Here the Lewisian discontinuous covering of glacial drift which is most extensively ately above the head of Loch Carloway. Three valleys help to deter - the townships and settlements (figure 37). The townships to the north- way river are found on more gentle slopes than those to the south east are less uniform and are less uniform and are often broken by short . The north western area therefore offers an environment where almost tion is possible whereas in the south east the frequent rock outcrops ented cultivation on minute plots which are inaccessible to the tractor ed implements.

heavy and acid even on the skinned land of the boulder clay slopes nor air to mitigate the acidity of the peaty areas which descend almost to y in one place is there any trace of the influence of the sand and this is the crofts numbered 1 to 3 Garenin border the small bay in the north of ere the fierce gales have blown some of the finer beach deposits on to

On the upper common pasture en have increased since the abandonment of the shielings and the attle stock; many inhabitants remember that the hills once had a much. Nor is this a feature confined to the common pastures; on one croft in .9 acres are completely covered by heather whilst a neighbouring croft f oats on similar land. At the loch in both Knock and Upper Carloway rable land have reverted to moss, the old lazy beds being picked out by

settlement pattern is one of great interest for it shows in a clear way distrinct phases in the historical geography of the area. The evidence llure stands side by side. Before attempting to justify this assertion it ve a brief account of the physical evolution and distribution of settle-

permanent settlement is believed * to have been the permanent occu- used by people from Bernera until the eighteenth century. Until about was held run-rig and the houses were huddled together in tight little individual crofts were lotted, about 1850, the houses weresattered, and generally up to fifty yards from the present road (which was then ugh track). Sea access was then most important but since the advent ransport new houses have been built nearer to the roads, producing the linear plan. The roads extend at different heights across the slopes

mation supplied by Mr Macleod of 27 Garenin.

TEXT CONTINUED ON PAGE 101

strips running across the slope, which are interchanged each year, whilst a large part of the common grazing lands are divided into interchangeable sections ("quarters") to accommodate each of the groups of crofts. See Figures 22 and 23.

The cultivable croftland at Kneep is relatively flat and the natural drainage is poorly developed; the quality of this land, depends to a very great extent on the upkeep of a dyke running across the croftland from a small marshy loch to the sea. This dyke has not been cleaned for several years, and as a result a large area has been invaded by reeds. Other parts of the croftland have been similarly overrun by 'wild rhubarb'. Such deterioration is almost inevitable when land is so fragmented.

The crofts at Reef are grouped in three separate localities. Crofts 1, 2 and 3, on the edge of the machair have probably never been occupied since the crofts were allotted in 1921 and are now used only for grazing. The main body of the crofts (nos. 3 - 13) face south - they are more compact than those in Valtos and Reef, but they vary in size from 2.9 to 13.25 acres and their boundaries are irregular in shape. Two crofts (14 and 15) are separated from the main parts of Reef: they are both small (2.5 acres) but the size is compensated by their situation on the level terrain of the machair. The old farm house is used as the dwelling for both 14 and 15. Much of the cultivation at Reef, except on the machair crofts, is on lazy beds - but many of these have decayed with the advent of horse and tractor ploughing; 35% of the land is cultivated by spade, and the remainder by horse plough.

The crofting economy is probably at its lowest ebb in Reef. Only eight of the fifteen crofts are occupied and of these five are worked by disabled crofters or crofters over sixty-five. The Reef crofts were settled in 1921 by returning ex-servicemen and today seven are being worked by the original settlers; there is little evidence of a desire among the younger generation to succeed to the crofts.

Until 1956, crofters on Reef used to graze both sheep and young cattle on the Flannan Islands, fifteen miles west of Uig.

Fig: 24 shows the age/sex structure of the population in the three townships. It tells a story familiar to crofting townships: 55% of the resident population are over forty-five years of age; 9% of the total population are permanently away; and since 1939 the population has declined by at least 15% as the result of emigration alone. But perhaps the most significant fact is the very small proportion of women of a child-bearing age and the consequence that only three children are being born each year to replace the older generations.

By their very position, the townships of the Valtos peninsula are isolated. Fifty years ago communication with the rest of Lewis was by boat. The road to Valtos and Kneep was built originally to bring the mails from the pier at Meavaig; the motor road to Reef was completed in 1956. Shopping facilities are provided at Valtos, for the people at Valtos and Kneep, and at Meavaig which serves Reef, Uigean and Cliff. These are supplemented by travelling shops which call once per week, by Indian dealers and by the local 'bus-driver who makes purchases in Stornoway on behalf of customers on the peninsula. The school for the whole area is situated mid-way between Cliff and Valtos and two kirks and the doctor's house lie at the junction of the Valtos and Reef roads.

CHAPTER EIGHT

LITTLE LOCH ROAG DISTRICT

(Meavaig, Caryshader, Ungshader, Geshader, Enaclete and Gisla).

by

Annis Heawood.

33 Little Loch Roag is a narrow sea loch extending southwards about twelve miles inland
[33] from Loch Roag proper. It has been formed by glacial erosion picking out one of the
[134] n.n.e. to s.s.w. lines of weakness characteristic of the Lewisian gneiss. Although generally steep-sided, recent glaciation left much ground moraine and this material, best preserved on the less steep slopes, provides arable land for several small townships on or near its western shores. The eastern shore is the more rugged and although a few small townships once existed there is now only the small farm and shooting lodge of Scaliscro. At the head of the loch is an estate cottage for Morsgail Lodge which is a large mansion with extensive fishing and shooting rights, grandly isolated about a mile inland from the main road.

361 The district here described includes Gisla, near the head of Little Loch Roag, Enaclete
[33] Ungshader, and Geshader, on the western shores of Loch Roag proper. All these are strung out on or close to the main road. Meavaig, like Gisla, is a small farm but also
365 functions as something of a metropolis for south Uig; it has the post-master, whose other functions include registrar and receiver of wrecks it has two churches, a telephone exchange, the district doctor and manse, and a petrol pump. At the time of our visit it was also the base for the 'bus service. Its metropolitan functions arose in the days before the road replaced a ferry boat service from Callanish; here the mails were landed until some date in the 1920s, and here, too, the estate kept coach and horses for transport to Uig lodge, three miles further west.

361 There is no record of the original settlement of the four crofting townships, nor of
365 Gisla, which was a township (or 'joint farm') of five crofters until about 1850. Some modern houses and bungalows have been built, many with easier access to the road than
32 the old black houses, now often used as byres. Water supply does not seem to present a serious problem because of the extensive moorland gathering grounds to the west, but there are not at present any water-supply schemes. Electricity is, of course, available. Caryshader and Enaclete are on the main Stornoway road being served at present by the 'bus and by vans selling meat, groceries and fish at least once a week. Enaclete has a sub-post-office. Geshader is less fortunate since, although vans call regularly, 'buses must be met at the junction of the unsurfaced track and the main Stornoway road, where the school serving this district also stands. The track has been extended in recent years so that it now reaches all the houses. Ungshader, however, is smaller and although it has had similar delivery arrangements, it is now a dying settlement largely due to its inaccessibility.

7 The crofts are mostly regular in shape on the landward side and fenced except where
2 the land is very broken as in northern Enaclete. In Caryshader there are fourteen legal
1 crofts which at present are worked as eleven units; one is used only as a holiday home by its owner-occupier and there is one squatter on the common grazing. In Geshader there are eleven crofts, each worked independantly; Ungshader has four crofts but the

INTRODUCTION

137 isopeths of average wind-speed show an overall figure of 17·5
132 mph. Winds of gale force (8 or more on the Beaufort Scale) occur in Stornoway about twenty times a year, and blow for an annual average of about 378 hours, loosening trees from the shallow ground and stunting growth. Yet another factor is the fine salt spray, 'small rain with salt in it from the sea', which is carried far inland over the island, the prevailing winds blowing straight off the Atlantic Ocean in a south-westerly to westerly direction.

137 The flora of Harris and Lewis merits a full volume on its own.
133 Far from being sterile, the moors, the hills, the machar-lands, the islets in the lochs, all present subjects of great interest. To the botanist, the island is a region of moorland with loch, marsh, bog, burn and high hills, with sometimes extensive patches of the old man's skin protruding to show the Lewisian gneiss. Variation is offered by the addition of rocky hill-slopes, fine sea-cliffs and shingly bays; sandy parts add to the floral variety, richest in the marine outreaches. To catalogue the flora is to list names which can be appreciated only by seeing the plants themselves in the habitat which they have taken as their own, much as the Hebridean *homo sapiens* has taken to himself the 'savage' country which awed early tourists. Rare species have been found by visiting botanists, and are discussed in the work of Professor Heslop Harrison and his group from Durham University. There is colour aplenty at all seasons of the year in the island; one merely needs to train the eye to look for it, to find, for example, those miniature woodlands in such places as the gorge of the river Amhuinn Gillan Tallair, in south Harris. And in particular, one might mention the blaze of whins around Stornoway; the luxuriant wild growth on the sandy machar-lands in Uig; just north of Stornoway, and at Ness; the miniature sieges of growth on the lochs' islands; and the Alpine plants associated with the higher reaches of land in Uig and North Harris.

Whereas the land is a relatively poor place, the sea is rich, and so is the flora and bird-life to be found round its shores. Near the shore line the grass has a sweet taste liked by sheep. Much of the flora is typical of the island, suited to withstanding the lack of humus to act as a sponge for water, and the paucity of soil for roots. Marram grass, scurvy grass, sea pink, sea campion, thrift

INTRODUCTION

135 Headrick's recommendations. However, he promised to make ex-
*175 periments on the economic value of the 'bog-ore of iron' found in many parts of the island, with a view to making bar-iron. Peat was to be used as a fuel for smelting.

376 With so much water on the island, it is natural to expect to find some of it harnessed for the generation of electricity. The Gisla hydro-electric scheme is on the west of Lewis, to the west of the shores of Little Loch Roag. The Harris scheme is at Loch Chliostair, at the foot of the three peaks of Tirgamore (2,227 ft), Ullaval (2,135), and Oreval (2,165). Some 12 per cent of the island's total electricity production is generated thus, the remainder being diesel generation at Stornoway (see Chapter 11).

133 Next to water, the island's most readily available resource is its
134 stifling blanket of peat, which covers more than 80 per cent of Lewis's land area. It has had a more than significant effect on the natural history of the area, its scenery and the human element.
* [175] When the deposits were examined in varying detail in 1910-11, it was estimated that they covered no less than 230 square miles, in depths up to 16·5 ft; the average depth of peat over the whole island was assessed at 5 ft. On this basis the deposits would con-
314 tain approximately 85 million tons of solids. A survey carried out
*175 by the Peat Section of the Department of Agriculture & Fisheries for Scotland in 1952 indicated that the earlier estimates were slightly high.

In 1946-7 the Ministry of Fuel & Power reconnoitred the peat deposits on both sides of the Stornoway-Barvas road and indicated that these were suitable for large-scale utilisation. Yet today, despite these Government-backed investigations, the peat deposits of Lewis are still used only for domestic fuel. One of the points made in a 1952 survey was that the area was generally firm enough to take the weight of various bog machines for digging and milling. Another point was that the calorific values of ten out of twelve peat samples were in excess of 10,000 BTU/lb.

CLIMATE

• 132 The rainfall has already been mentioned, averaging an annual 43 inches, according to readings taken at the Meteorological

CLIMATE

Station of the Air Ministry at Stornoway Airport. About 45 per 132 •
cent of the rain falls during the months of April to September inclusive. The annual average of days without rain is about 122, so that some rain is expected on two days out of every three. May to August is of course the driest period, averaging about fourteen rainless days. The sunshine record shows more sun on the east coast than on the west, as one might expect. The annual

Temperature and precipitation; sunshine and windspeed

INTRODUCTION

• 132 average of hours of sunshine is only 1,100 to 1,200, the long-term monthly average of sunshine hours for Stornoway being; May, 195; June, 173; July, 128; August, 133; September, 111. Reducing temperatures quoted to a mean sea level, the range is about 8° C (55° F), from the mean of 6° C (44° F) in January. This January mean is relatively high—compared with the 3° C (38° F) for Cambridge, some several hundred miles farther south—and is due to the body of warm Atlantic water which originates in the Gulf of Mexico. The winter isotherm trend is north to south, emphasising the predominant influence of the Atlantic Ocean as a source of comparative warmth. Snow lies on an annual mean of five mornings each year (Paisley, 10; Edinburgh, 10; Nairn, 20). Also, summer temperatures are lower than those of the south of Scotland and of England. There are, however, much longer hours of summer daylight, a feature of high latitudes.

CHAPTER II

THE SEASONS, PLANT LIFE AND THE CROFTERS' YEAR

(A) CLIMATE, WEATHER AND ANNUAL RHYTHM

132 THE Island climate is 'mild' or 'cool temperate', without strong contrasts of heat and cold in summer and winter, but subject to much wind.[1] Fig. 5 shows how, from October till May, the mean monthly temperatures lie between 40° and 50° F.; and only in July and August do they rise to 55° F. This 'lag' in temperatures tends to make the crops late and brings oats to harvest in September, which has the same mean monthly temperature (51° F.) as June, but nearly twice its rainfall (4 ins.). The total sunshine hours for August average only 130, compared with nearly 150 for July, so that late hay is slow to dry (Fig. 6). These averages characterise the more inhabited areas; among the hills of North Harris rainfall is higher.

Cloudiness is characteristic, the total of bright sunshine being only 30 per cent of the possible even at Stornoway. The annual rainfall of Stornoway is 50 ins. per annum; that at the Butt, recorded as 40 ins., must be rather more than this, as a rain gauge on so windy a site may fail to catch rain driven horizontally in a gale. The rainfall

[1] The latitude of the Island is approximately 57° 40′ to 58° 40′ N., and the longitude 6° to 7° W.

132 maximum occurs in the winter months and the minimum in spring; the spring sunshine would encourage the

FIG. 6

growth of the crops, were it not for the lag in temperature and the fact that the chill easterly and north-easterly winds check growth.

82 Two sayings sum up the lag of the seasons in the West
824 and its effect on crops. The first runs, "Winter comes
241 not till after New Year, nor Spring till after St. Patrick's
[538] Day" (*Cha tig Geamhradh gu cul Calluinn, no Earrach gu cul Fheill Paruig*). St. Patrick's Day is the 17th of March, but old-style reckoning put both dates later still. The
[538] other runs, "A frosty winter, a misty spring, a chequered summer, and a bright, sunny autumn, never left dearth in Scotland" (*Geamhradh reodhtanach, Earrach ceothanach, Samhradh breac riabhach, us Foghar geal grianach, cha d'fhag gort riamh an Alba*). The retort is that though western summers may often be chequered with sun and showers well suited for growing grass and grain, the autumns are not really sunny, but rainy. Hence 'dearth'—of grain—must result from spoiled harvests. Not so for grass, unharmed by a wet autumn. Hay, if ensilage is not possible, can usually be gathered unharmed in sunny spells
[132] of summer if cut in good time. Agriculturally, the climate favours 'grass' rather than grain.

132 Plentiful rainfall and coolness throughout the year do
137 not allow of complete neutral decomposition of vegetable
[134] matter in the presence of air. Hence, year by year, a residuum of acid humus accumulates as peat on the ill-drained surface. Prehistorically, more favourable phases of climate permitted the growth of pines. Knowledge of present temperature and rainfall alone would suggest the growth of broad-leaved deciduous trees, but these are absent except in the sheltered policies of Stornoway Castle. About 1695 Martin noted 'hazel and birch' occurring on the south side of Loch Stornoway, but nowhere else on the Island. Even there trees are stunted as if pruned by the wind.

132 The further inhibitive influence is indeed the wind

132 (Fig. 6). The anemograph at the Butt of Lewis records one of the highest of British averages for gales and frequent breeze: for 1930–35 the mean frequency of gales (winds over 38 miles per hour) was 62. The mean speed for December and January is 25 m.p.h., which can best be realised by imagining winter travel in an open car with no wind-screen. This mean maximum is a reminder of the difficulty of tree-growth, as gales loosen or quite uproot
[538] the trees. It also helps to explain the proverb: "A long sleep in a big wind" (*cadal fada ri gaoith mhoir*). This is as true for the byre as the bed-closet, for what could cattle-beast or man be doing out of doors in a winter gale? Although the mean speed drops from 18 m.p.h. in April to 13 or 14 m.p.h. in July and August, it rises in September to 18 m.p.h., with ill effects on the harvesting of late crops. Winter winds blow in full force from the end of September to mid-February at an average of 22 m.p.h. or more. The gales make winter fishing dangerous, and their force smashes breakwaters on the west coast.

Yet winds at the exposed cliff-height of the Butt are only slightly greater than those of similarly placed spots on the mainland coast, or islets like the Bell Rock (Firth of Tay), and the east of the Island is comparatively sheltered. For example, the mean annual speed of wind at the Butt was 19·2 m.p.h., and for the same period at the Bell Rock it was 18·2, at Aberdeen 9, and at Kew 7·6. When the anemograph at the Butt was moved even to a 'well-exposed' spot near Stornoway, the average number of gales for 1937–40 dropped to two-thirds of the preceding triennium. With shelter, the difference from the Butt and the approach to normal conditions on the mainland would become greater
[311] still. The planting of shelter-belts would foster crops, comfort and activity on the Island.

133 South of the basalt plateau, the Cuillins and the Red
311 Hills have intruded into the lava. Although the Cuillins
dominate the landscape for many miles, they are absolutely
103 useless agriculturally. Indeed, a case might be made for the
derivation of the name Cuillin from the Welsh coolin (worth-
less).[3] The worthlessness of the mountains in the local
economy is attested by the fact that they are the only mountains
in Scotland with peaks named after men, all of them mountain
133 climbers of the last century.[4] At the same time, however,
311 they have become a valuable asset in the tourist trade.[5] The
[18] Red Hills rise to 2,537 feet. They are mostly covered with
scree and skeletal soils, but they have some pastoral value.
All have traditional Gaelic names.

133 Below the mountainous region a broad limestone valley
extends across the island from Broadford Bay to Lochs Eishort
and Slapin. Like northern Skye, it is a gently rolling region
[31] with few rises which exceed 500 feet in elevation. The po-
tentially good soil is frequently masked by a heavy overlie of
peat.

Sleat, the southernmost peninsula, reveals a compli-
[131] cated structure, a complex of ancient rocks and moraine.[6]

stock grown for local household consumption and export but also the subsidies and grants provided by the national government. I hasten to add that it is impossible to estimate accurately the specific contribution of crofting to the economy of Skye. There is no available means of distinguishing the status of crofter from that of farmer in the annual returns of crops and stock or in the applications of farmers and crofters for subsidies and grants. Before getting down to pounds and shillings, we may find a brief digression to review the acreages of land devoted to crop and stock raising and the yields to be expected helpful in our attempt to understand the many problems under which the Skyeman labors.

The total area of Skye is approximately 447,000 acres. Of this area, 422,415 acres were classified, in 1953, as rough grazing.[7] The land under cultivation, excluding grasses, was only 3,254 acres. There were 6,258 acres of grass intended for use as hay and 12,339 acres of permanent grass or improved pasture. The remainder, about 2,500 acres, was unclassified.

The stock, in 1953, was 1808 dairy cows and heifers, 8,108 cattle, 143,422 sheep, 41,888 fowls, 438 horses, and 319 pigs.[8] The dairy cows are mainly beef breeds which give a low yield of milk. The sheep are primarily the hardy blackface variety but some crofters have cheviots, which produce a finer wool. For each sheep there are about three acres of grazing

is the northernmost island in the Outer Hebrides (see Map B). The population is concentrated along the coast, like a hat-brim around the great inner core of the island's heather-covered bogland, a population belt classified as "dense rural" (50-400 persons per square mile) in a map based on the 1951 census. The pattern of land settlement reflects the importance of fishing in the economy of the island.

Lewis lies between 6°10' and 7°20' west longitude, and between 47°50' and 58°30' north latitude. Lewis is as far north as Newfoundland and farther north than Mongolia, but the temperature is mild because of the North Atlantic Drift, or Gulf Stream, which passes the west coast of Scotland. The temperature averages 55°F. in summer, and 44°F. in January. A constant climatic feature of life on the treeless island is the wind, a relentless, insidious presence which often reaches gale force. Winds of 60 m.p.h. and more are common.

Rain, which comes in downpours or light mist, averages 55 to 65 inches per year. The water may be held in colloidal suspension with decomposed organic matter in the compact, spongy material called peat, or pour as rivers and streams off the island's shelf of non-porous Archaean gneiss into the sea. Of Lewis' total area of 437,200 acres, inland water comprises 24,863 acres.

175 During a huge snow-fall that occurred on
261 Lewis in the 1950's, the mobile grocery vans and other
[132] supply vehicles could not come out to the west side,
[443] and a group of men had to make an expedition into town
for provisions, after which many families made certain
that they always had a good supply of meal, salted
[404] mackerel and herring. Many villagers have gotten deep
[365] freezers to store beef and mutton; others say they do
not trust the freezers, that a failure in electricity--
which occasionally happens in this region of gales and
far-away repairmen--would bring disaster if they depended
458 fully on them for keeping their meat. When the tweed
226 industry is going through one of its periodic depressions,
more men go out more often to fish. "I've been going
out every night for the last week or so. I don't have
a tweed, and I won't have one for the next six weeks.
I don't know what I'm going to do; maybe I'll go back to
sea. Three of us caught one hundred mackerel last
[251] night. I salted my share, and didn't give any of them
away. These are the hard times. We're going to need
them during the next six weeks."

233 A few people raise beef cattle, depending largely
[654] on subsidies for encouragement to do so. A few are
[234] beginning to keep cows again for milk, giving as their
[435] reasons that freight charges make the bottled milk too
[434]
[648]

INTRODUCTION

133 One glance at an island map will show how numerous are the
• [132] lochs. These and the short rivers and streams do their best to drain
the rainwater which averages about 45 inches, with an added 10
inches or so for precipitation in the form of very fine rain or mist.
That the rockbase of the island is much like an impervious saucer
which overflows easily is seen shortly after a heavy rainfall.
Streams and rivers become torrents of brown, foam-flecked waters
tumbling to the sea or to some nearby loch. The watershed of
Lewis runs from north-east to south-west, keeping about the
middle of the island, except in the north where it approaches the
133 eastern side. The rivers, all quite short, have at one time in their
136 history carried good stocks of trout and salmon; some still do.
The Grimersta River, though less than two miles long, is reckoned
to be the best salmon river in Europe. Its waters come from the
great loch and catchment area of Loch Langavat (Norse: Long
Water). The River Creed, just outside Stornoway, is also known
for its salmon which, in the right season of year, can be seen a
tantalising arm's length away, making their way up river. Another
salmon river is that beside Amhuinnsuidhe Castle in North Harris,
where the salmon leap several feet over a sheer rockface to gain
the upper waters. Of the lochs, virtually all abounding with
trout, the largest is Loch Langavat, about six miles in length.

FLORA

137 The first reaction of the visitor to the island is to comment on the
scarcity of trees. 'Treeless' is a relative term, however, for there
are trees on the island. And the island was not always so bare.
After the last Ice Age retreated some thirteen milleniums ago, the
initial tundra was covered by birch scrub which developed into a
wide birch-pine forest with some dense hazel undergrowth. Oak,
alder, birch, pine, ash and rowan could be found. Then, with
the advent of the cool, wet, sub-Atlantic period about 3,000 years
ago, conditions became ideal for the formation of blanket bog
and the accumulation of peat. The trees failed and fell; natural
clearings formed. When the Norsemen visited the Hebrides, they
found substantial areas of woodland, deteriorating, but still
sufficient to attract their attention.

FLORA

*175 Pursuing a 'scorched-earth' policy, a Norse leader, Magnus Bare-
137 leg, on a punitive expedition to Lewis in 1098 destroyed much
[177] of the island's natural surface resources. Trees were a particular
target. Following this wanton destruction, the shrinkage of wooded
areas in the island was accelerated by the requirements of the
[136] population and by the developing peat. Captain Dymes, an
Englishman who visited Lewis in 1630 in connection with Charles
I's fishery schemes, reported 'there are many eagles and hawks in
the isle which breed in the clefts of rocks, for this place is so
destitute of wood that there is not one tree growing in the whole
island.' Martin Martin almost confirmed this a generation later:
'I saw big roots of trees at the head of Loch Erisort, and there
is about a hundred young birch and hazel trees on the southwest
side of Loch Stornoway, but there is no more wood on the island.'
Before Sir James and Lady Matheson came to Lewis in 1844,
the MacKenzie gardens outside the old Seaforth Lodge, where
Lews Castle now stands, had many fruiting apple trees.

The mention in 1695 of the Stornoway plantation is interest-
ing, for it is here that today stands the greatest concentration of
trees in the whole of the Hebrides, in the grounds of Lews Castle.
Some 300 acres of trees here, mostly conifers, but with some hard-
woods and deciduous trees, were planted by Lady Matheson about
a century ago. Soil had to be transported from the mainland to
supplement the scanty layer of peat which overlay the hard Lewis
rock. Another of Lady Matheson's legacies is a small area at
Achmore, one of the few townships to be found inland, far from
the sea. Here, larch and other conifers grew well and would be
there today had not a fierce gale blown them down in 1921. There
137 are some ninety-year-old Corsican pines at the head of Little Loch
Roag. Another plantation of deciduous and coniferous trees can
be found at Grimersta on the Atlantic coast of Lewis, and two
more small areas of trees are at Scalisgro, on the east side of Lewis,
and in Glen Valtos. In Harris, there are some magnificent syca-
mores at Tarbert; and at Borve, on the west side of the island,
are several acres of stunted mountain pines. In addition, dwarf
rowans cover many tiny islands in the lochs.

137 Natural tree growth is impossible in most areas because of the
• 132 peat. The strong and frequent winds are also a deterrent. The

CHAPTER II

A FIRST IMPRESSION OF SKYE

Scotland includes among her distinctive characteristics
e possession and jurisdiction of more islands, 787, than
y other nation in Europe. Stretching along Scotland's
st coast for 200 miles in an inner and outer archipelago,
e Hebrides account for over 500 of these islands. The
le of Skye is the largest of the Inner Hebrides. Reference
the map (Figure 2) will show that Skye is forty-nine miles
ng and from three to twenty-two wide. The coastline measures
) miles. The total area is 643 square miles. Although less
an a mile separates Skye from the mainland at Kyle Akin and
le Rhea, the inhabitants are enisled geographically by the
and culturally by the peripheral position of the Island to
main stream of British society and culture.

The isolation of Skye is due to two basic facts. The
ography of the Highland region, with its scenic valleys, cut
sea lochs and flanked by precipitous mountains, has created
ural barriers to communication with the cities of Lowland
otland and England. The second fact is that the transportation
ilities of the Western Highlands have never been integrated
h Great Britain's main communication system. The problem,
n, is not as much one of distance from the centers of

FICHE

137 found with the dominant are the fine-leaved bell heather, sometimes with crowberry (*Empetrum*) in rocky places, while grass or sedge may be mixed with it in places.

At the very edge of the sea-cliffs, where the moorland pasture or heather thins out, the rock is cushioned with sea pink. Or where a stream has cut a sheltered dell, protected as in the Stornoway policies or not too near a village, one may find a few woody plants—a little hazel, creeping willow or honeysuckle.

137 134 (6) *Sandy Pastures.*—In many bays, as at Valtos (West Loch Roag) the sandy or sand-influenced habitat falls into three zones:

(*a*) The line of storm beach, formed of hummocky dunes, which dams off what was the inner part of the bay. This line is more or less broken where the stream breaks through. At their crown the dunes are partially fixed by marram grass (*Psamma*), but show hollows of loose sand. Just north of Stornoway the Melbost sands have thrown out a high bar which has partly dyked and reclaimed or poldered the bay behind. Almost at the opposite end of the Island, lying in from the Sound of Taransay, near Luskintyre, a sandy dyke is thrust out, but this too is kept open by tide and spate, and the sands within are covered at high tide. Such places could be reclaimed.

(*b*) Behind the dune ridge, where this is virtually complete, is found a dry sandy flat. Even this is liable to inundation by storm, tide and spate, but its sandy pasture is periodically broken for the cultivation of potatoes, or even barley. It is the lightest of soils at the best, while if cultivated continuously it simply

[132]

ISLAND, WORK AND PEOPLE

[233] away, and for a shorter period. The sheep wander over
[31] the moors all the year round, though they hang about the crofts when the winter is severe.

[221] A comparison with mountainous Norway or the Alps
[132] and their high summer pastures suggests itself; but in Lewis altitude is almost negligible, and the shielings may
[171] lie only two to five hundred feet above that of the crofts
[133] beside the shore. The difference between winter and
[301] summer is in any case less, snow being rare and the conditions being such that even in summer the shieling pasture remains poor. Hence it is that while modern Norse and Alpine economy still maintain the summer pasture, the shielings have died out in the Highlands and are slowly decaying in Lewis. Seasonally, stock are transported over longer distances, from Highland to Lowland pastures.

[181] Reasons for the continuance of these and other crofting
[198] ways, or for their abandonment, are not of an economic
[461] order alone: not only the remuneration received for labour, but the feeling for the work counts enormously. Visiting a couple of distant shielings in the summer of 1919, I found that two lads newly home from the Navy had come up from their village "for a holiday", bringing rods for trout-fishing and high spirits for play. By day they fished or flirted. By night they slept in one of the two shielings, while the two laughing lasses they had come to visit shared the none too wide couch of the other shieling with the two older women there. One of these was a matron with a motherly twinkle in her eye, the other was a spinster in whose eyes there shone a memorably vivid light; she was the sister (as I found later) of a noted minister on the mainland. The bare simplicity of shieling life is traditionally softened by fellowship and a gaiety that is not beyond
[538] control. A Lowland poet once coined a famous phrase,

132 summer, despite the long duration of daylight, the average daily
hours of sunshine are six. In winter, the daily hours of sun-
shine are reduced to less than one. In 1953, an average year in
respect to sunlight, the total hours of sun were 1142. Over
132 2000 hours were recorded in June but less than 20 in December. It
182 may be that the philologists are right in insisting that Eilean
Sgeithanach is derived from the Norse ský (cloud). Certainly the
poetic name for Skye, Eilean a Chéo, the Isle of Mist, is in
keeping with the atmosphere.

The prevailing rain and cloudiness are serious handicaps
to agriculture, but they are not the only inhibitive forces.
The wind is another very important factor. Gales are common.
They restrict the number and variety of crops which can be
grown, hinder tree growth, and often make the use of the sea
impossible.

The System of Land Use

34 The Sgeithanach, the Skyeman, is a small farmer who
combines pastoralism with a limited amount of agriculture.
In view of the severe environmental limitations on crop pro-
duction and the markedly disproportionate ratio of arable land
to natural grass land, this ecological adaptation of the culture
172 is by no means surprising. Nor is the fact that this adap-
34 tation has persisted since the first known appearance of man
a startling revelation. This was four thousand years ago when
the culture history of Skye began with the advent of the
Neolithic. This persistence is simply an expression of the

If May is considered a busy month, June duties are even 231
more pressing. Although the winter gales are over, the rain- 232
fall has begun to increase. A succession and variety of de- 234
mands are made on the crofter's time. Once again the sheep
must be brought down to the "fank." This time the purpose is
to mark the lambs. The males, unless one or two healthy
specimens are selected for future use as rams, are castrated
and smeared with a dye to indicate their ownership. The
females are smeared and have their ears cut to signify both
ownership and age. Like the dipping, this operation requires 234
the cooperation of the crofter and his family, the neighbors, 235
and hired hands. Not the sheep without lambs are dipped
once again and given a dose of medicine for liver flukes and
a variety of diseases. At the same time, the early hay and, 241
perhaps, the early potatoes are ready for harvesting. The end 243
of June brings the Highland Wool Fair in Inverness. If he 235
has Cheviot sheep, as most crofters do, the man must go to
arrange for their wintering on the milder and drier east
coast. Although Cheviots produce a finer wool than the more
common Blackface sheep, they do not stand up to the incessant
wind and rain of a Skye winter. If his wife can leave the
children behind, she will accompany her husband. The old
function of the Fair, the sale of wool, has disappeared under
government price control legislation.

It is not unusual to have the early harvest delayed
until July, but even then the mowing may have to wait because 231
sheep must come first. On one of the dry days during the first 236

or second week, the ewe sheep are sheared. Shearing is an- 231
other cooperative task. The men and women work together
with only one significant division in their labor. Women
never shear. Their task is to run the sheep through the pen
and fold the fleece after the two men shear the animal. An-
other chore is added to the crofter's schedule at this time.
He must begin to watch his sheep for maggot.

The haying season runs through July and August, depend- 231
ing on the weather. In August the sheep have to be dipped again 232
this dipping prescribed by law, and the wether lambs (castrated
males) are sent to market. In September, if the weather is
favorable and the season has been good, the harvest of oats
begins. The men works with a scythe. Women never cut. His
wife helps by binding the corn in sheaths by hand and making
stoops in the field. Later she helps her husband build the
stacks for winter storage. As in any summer month, the stock 231
requires attention. Cast ewe sheep (sheep over six years old) 233
and some rams are sent to the Ministry of Food grading station
at Ayle, on the mainland, to be graded for meat or to Dingwall
to be sold at auction. Cattle sales are also held on the
island in September and again in November, but the full-time
crofter prefers the Dingwall auction. The rainy season is 232
now, as noted, reaching its height. The pace becomes slower.
October, November, and, perhaps, even December are spent trying 231
to dig potatoes and turnips. Too often the oat harvest has 233
yet to be completed and the sheep must receive their second
statutory dipping. Sometime before the end of November the 231
236

313 Just outside of Portree was taken (verin 1953), and there are
plans for acquiring additional blocks of land.

One reason for the optimism surrounding the potential
benefits of forestry to the Highlands is the growth of population
which it apparently stimulates. In Glen Brittle the local
school, closed for many years, has been reopened. But, as
in all migration schemes, the average age tends to be low,
and, consequently, procreation is to be expected. Whether or
not the potential benefits will be realized remains to be
seen. Decidedly in favor of forestry is the stable employment
which is offered. Further, a man can be allowed time to carry
on crofting not only in his spare time but also full-time
when seasonal demands require his full attention. Whether or
not there will be enough land left for pastoral-agriculture,
near the plantations if he wants to take the time, is another
question. Then, too, there are natural limitations to the
extension of forests.

313 The difficulties to be faced by forestry on Skye may be
briefly summarized. Above all, conditions for tree growth are
132 far from ideal over much of the island. If the soil is fertile
enough for trees, as in Glendale and Kilmuir, exposure to the
south and west winds may be too severe for a plantation. Shelter
belts might be planted, but they have no commercial value and
offer only fleeting employment. If there is shelter from the
wind, as in Bleat, the soil is either too poor or too boggy
for commercial operations. Beyond the areas already acquired
and the few small plantations on private estates, the land
313 considered plantable is in limited, isolated patches. At this

134 The Outer Hebrides, a chain of islands over a
133 hundred miles long which lie to the northwest of the
Scottish mainland, are part of "Ross and Cromarty"
and "Inverness," two of the seven crofting counties
105 of Scotland (see Map A). The seven crofting counties
(Argyll, Inverness, Ross and Cromarty, Sutherland,
Caithness, Orkney and Shetland) constitute the scenically
beautiful agriculturally marginal land often
referred to as the Highlands and Islands of Scotland.
101 The word "Highland" also refers to features of social
197 life such as crofting tenure, strong community feeling
and Gaelic-speaking which are characteristic of many
communities in both the Highlands and Islands as well
as in cities such as Glasgow in which persons from the
Highlands and Islands have settled. For example, a
Gaelic speaker whose parents came from the Islands and
settled in Glasgow may be called a "Glasgow Highlander."
The first four crofting counties listed above have a
132 large percentage of Gaelic speakers. In the national
162 census of 1961, 82.34 of the 32,607 inhabitants of the
Outer Hebrides were Gaelic speakers.

Lewis and Harris, a single body of land which is
131 sometimes referred to as two islands because the
135 mountainous southern section called Harris differs
markedly from the flat, northern moorland of Lewis,
is the northernmost island in the Outer Hebrides
(see Map B).

The Lewis village of Laxay on Loch Erisort

1 INTRODUCTION

31 THOUGH generally referred to as separate islands, Harris and Lewis are geographically speaking one island—the largest landmass in the Outer Hebrides. Its latitude is approximately 57° 40′ to 58° 40′ N; its longitude 6° to 7° W. Many have expressed surprise at the size of the island, which is over 800 square miles in extent. From top to bottom the crow's-flight distance is just over 80 miles, and from east to west about 14 miles. By road, however, the north-south journey (the Butt of Lewis to Rodel in Harris) is a good 80 miles. And by road from east to west (Tiumpan Head lighthouse to Breinish in Uig) is 54 miles.

33 Among the oldest islands of the world Harris and Lewis is founded, like a strong resisting house, on rock, on gneiss said to be
35 the oldest fragment of Europe. From a distance the tough durable Lewisian gneiss is easily recognisable as bare, barren, elongated domes and ridges, giving a hummocky appearance to the landscape. Among other rock types to be found is a patch of a few hundred acres of granite in the parish of Barvas, on the west side of Lewis; some torridonian sandstone showing on each side of Broad Bay, around Stornoway; and the tertiary basalt of the Shiant Isles. These latter islands, pin-points of high land, are geologically speaking insular outliers of Skye, though they are but a few miles or so off the Lewis coastline. Another set of islands, associated with Harris and Lewis, are the St Kildas, composed of gabbros and basalt.

The continual exposure of the rocks on the island makes it easy for those interested in geology to see just what happened those countless years ago. Sands, muds and limestones were formed in an ancient sea, to be later heated and recrystallised as volcanic eruptions occurred. During this boiling, a seasoning touch of molten granite was added. Later, still in an ancient season, the rocks were thrust up and crushed against each other to form today's geological spectacular. Dark-coloured hornblende and

133 mica-sparkled gneiss show the intense shearing. And crushed rock,
135 known as flinty crush because it splinters so easily, adds another sight for the modern eye. The Stornoway beds, as they are called, are broadly known as torridonian sandstone, old red sandstone, or triassic; some geologists regard them as part of the pre-Cambrian torridonian series.

133 From geological evidence, twice did vast icesheets move over the rock-faces to round off the sharp corners of the island. And, as individually then as now, geologists think that there may have been a third small glaciation—a private Hebridean one. Today, the scenery bears the imprint of glacial striae or scratchings. Polished rocks show scores; lochs are gravel-damned, and there are countless small lochans and tarns formed from deep gouges in solid rock. There is some evidence too of a depression or land-sinking during a much later post-glacial time. Many times have fishermen found, far below the present high-water line, stumps of trees and buried submarine peat, the wasting remains of former land vegetation. Martin Martin, who wrote of the Western Isles
*175 about 1695, said of Berneray, one of the small islands in the
133 Sound of Harris: 'The west end of this island which looks to St Kilda, is called the wooden harbour, because the sands at low water discover several trees that have formerly grown there. Sir Norman MacLeod told me that he had seen a tree cut there, which was afterwards made into a harrow.' These vegetation remains indicate
[134] a former fertility. Volcanic action and deposit, the makings of good soil were, however, largely carried away by glacial movement to leave a thin scraping of boulder clay clinging to the base rock for dear life.

133 Lewis is largely rolling moors of blanket peat with many lochs and rivers. To the west of Lewis, in Uig, high hills begin to raise the eye. In North Harris, the hills are higher, reaching their peak in the Clisham (2,622 ft above sea level). These are not strictly speaking mountains. But they do present not a few problems to climbers, having some formidable rock-faces, and on the seaward side are virtually unscaleable cliffs. Much of the ice-moulded
[135] landscape of South Harris is rocky and barren, gneiss outcrops
[137] cover many acres in places, and are almost completely devoid of any kind of vegetation, except where, in the odd crevice, like lurk-

ing thieves, patches of heather, deer-grasses or moorland plants 133
live as they can on thin layers of peaty soil. To relieve the hard 135
scenery there are, on sunny days, glintings of water, lochs or rivers 137
flowing uneasily over beds of primordial rock.

PEAT AND RIVERS

The peat overlays of the island are reckoned to be not much 134
more than 7,000 years old. To strengthen this figure, when the
megalithic circle of Callernish, on the west of Lewis, was excavated [172]
by Sir James Matheson in 1857-8, a depth of 5 ft of peat was removed to expose the giant stones. Only the tops of these stones were showing before excavation was begun; the resultant calculation confirmed the age of this infertile blanket. Peat is decomposed organic matter without the sweetening of lime. The resulting material is sour, and highly acid in character, which checks the bacterial action necessary for good soil to be made. With compaction and age, peat becomes colloidal in texture, with a water content of about 92 per cent. Peat is still being formed in Lewis, though its progress is imperceptibly slow.

Frequent diggings have uncovered evidence that the island was 137
once densely wooded. The remains of trees, and the bones of certain animals and birds associated with savannah and woodland,
add point to this. Under the blanket of peat lies what is called 135
boulder clay, glacially deposited on the gneiss rock; many acres 134
of this clay have been exposed through centuries of digging up peat for fuel. Such skinned ground is called *gearraidh*, and it 134
forms the basis of a soil which, when worked together with shell sand and seaweed, becomes quite fertile. Of natural soil, so much taken for granted in richer places in Britain, there are a few patches in Lewis, at Garrabost and Ness; the valley of Strond, near Rodel in Harris, has much strong red loam.

133 One glance at an island map will show how numerous are the
[132] lochs. These and the short rivers and streams do their best to drain the rainwater which averages about 45 inches, with an added 10 inches or so for precipitation in the form of very fine rain or mist. That the rockbase of the island is much like an impervious saucer which overflows easily is seen shortly after a heavy rainfall. Streams and rivers become torrents of brown, foam-flecked waters tumbling to the sea or to some nearby loch. The watershed of Lewis runs from north-east to south-west, keeping about the middle of the island, except in the north where it approaches the
133 eastern side. The rivers, all quite short, have at one time in their
136 history carried good stocks of trout and salmon; some still do. The Grimersta River, though less than two miles long, is reckoned to be the best salmon river in Europe. Its waters come from the great loch and catchment area of Loch Langavat (Norse: Long Water). The River Creed, just outside Stornoway, is also known for its salmon which, in the right season of year, can be seen a tantalising arm's length away, making their way up river. Another salmon river is that beside Amhuinnsuidhe Castle in North Harris, where the salmon leap several feet over a sheer rockface to gain the upper waters. Of the lochs, virtually all abounding with trout, the largest is Loch Langavat, about six miles in length.

FLORA

137 The first reaction of the visitor to the island is to comment on the scarcity of trees. 'Treeless' is a relative term, however, for there *are* trees on the island. And the island was not always so bare. After the last Ice Age retreated some thirteen millenium ago, the initial tundra was covered by birch scrub which developed into a wide birch-pine forest with some dense hazel undergrowth. Oak, alder, birch, pine, ash and rowan could be found. Then, with the advent of the cool, wet, sub-Atlantic period about 3,000 years ago, conditions became ideal for the formation of blanket bog and the accumulation of peat. The trees failed and fell; natural clearings formed. When the Norsemen visited the Hebrides, they found substantial areas of woodland, deteriorating, but still sufficient to attract their attention.

137 isopeths of average wind-speed show an overall figure of 17·5
132 mph. Winds of gale force (8 or more on the Beaufort Scale) occur in Stornoway about twenty times a year, and blow for an annual average of about 378 hours, loosening trees from the shallow ground and stunting growth. Yet another factor is the fine salt spray, 'small rain with salt in it from the sea', which is carried far inland over the island, the prevailing winds blowing straight off the Atlantic Ocean in a south-westerly to westerly direction.

137 The flora of Harris and Lewis merits a full volume on its own.
132 Far from being sterile, the moors, the hills, the machar-lands, the islets in the lochs, all present subjects of great interest. To the botanist, the island is a region of moorland with loch, marsh, bog, burn and high hills, with sometimes extensive patches of the old man's skin protruding to show the Lewisian gneiss. Variation is offered by the addition of rocky hill-slopes, fine sea-cliffs and shingly bays; sandy parts add to the floral variety, richest in the marine outreaches. To catalogue the flora is to list names which can be appreciated only by seeing the plants themselves in the habitat which they have taken as their own, much as the Hebridean *homo sapiens* has taken to himself the 'savage' country which awed early tourists. Rare species have been found by visiting botanists, and are discussed in the work of Professor Heslop Harrison and his group from Durham University. There is colour aplenty at all seasons of the year in the island; one merely needs to train the eye to look for it, to find, for example, those miniature woodlands in such places as the gorge of the river Amhuinn Gillan Tallair, in south Harris. And in particular, one might mention the blaze of whins around Stornoway; the luxuriant wild growth on the sandy machar-lands in Uig; just north of Stornoway, and at Ness; the miniature sieges of growth on the lochs' islands; and the Alpine plants associated with the higher reaches of land in Uig and North Harris.

Whereas the land is a relatively poor place, the sea is rich, and so is the flora and bird-life to be found round its shores. Near the shore line the grass has a sweet taste liked by sheep. Much of the flora is typical of the island, suited to withstanding the lack of humus to act as a sponge for water, and the paucity of soil for roots. Marram grass, scurvy grass, sea pink, sea campion, thrift

• 133 and pearlwort are all to be found. It is not often that a plant is
137 given some measure of authority over the affairs of man: but the marram grass—known as 'bent', but not to be confused with the grass botanically referred to as bent *(Agrostis sp)*—is vital in stabilising the sand of the machar-lands; unless grazed or cut, with its dense network of roots it anchors the sand in perpetuity. With
[B24] the marram, the sea-sedge works hard to form a green coverlet over the sand, and acts as host to other plants, the shell-sand grassland offering excellent grazing for crofters' stock.

137 The richness of the flora of the macharland has been sung many times, and little wonder. It holds a multitude of what can be called plebian plants such as ragwort, buttercup, daisy, kidney vetch, bird's-foot trefoil, tufted vetch, gentian and primrose. Unfortunately the heavy grazing of these stretches of land results in many plants never being given the opportunity to develop and flower for the plentiful propagation of their species.

FAUNA

136 The entomologist will also find much of interest. The Hebrides have their own bumble-bee *(Bombus jonellus* var. *hebridensis)*, found nowhere else in the world. Other insects too have found an insular form, adding their rich thread to the weave of natural history in the region: the Dark Green Fritillary butterfly and the Green-veined White. Moths there are in abundance, some such as the Gray Dagger perhaps indicating the existence of woodland conditions in a past time. The abundance of lochs, streams and marshy grounds gives an abundance of dragon-flies and caddis-flies, eight species of which are represented.

Of wild animal life, however, the list is short, due to lack of shelter and poor ground. The red deer is found in the hilly fastnesses of Harris and the Park district of Lewis, though the deer are small, and well poached as one might expect where the density of human population is high. The pine marten, until the 1810s, lived in the region near the Clisham. A rare bat, the pipistrelle, has been found at Rodel. Rats, mice, rabbits, hares and otters are of course to be found.

The interior of the island is poor in bird life, but round the

135 Headrick's recommendations. However, he promised to make ex-
* 195 periments on the economic value of the 'bog-ore of iron' found in many parts of the island, with a view to making bar-iron. Peat was to be used as a fuel for smelting.

316 With so much water on the island, it is natural to expect to find some of it harnessed for the generation of electricity. The Gisla hydro-electric scheme is on the west of Lewis, to the west of the shores of Little Loch Roag. The Harris scheme is at Loch Chliostair, at the foot of the three peaks of Tirgamore (2,227 ft), Ullaval (2,135), and Oreval (2,165). Some 12 per cent of the island's total electricity production is generated thus, the remainder being diesel generation at Stornoway (see Chapter 11).

• 133 Next to water, the island's most readily available resource is its
134 stifling blanket of peat, which covers more than 80 per cent of Lewis's land area. It has had a more than significant effect on the natural history of the area, its scenery and the human element.

* [195] When the deposits were examined in varying detail in 1910-11, it was estimated that they covered no less than 230 square miles, in depths up to 16·5 ft; the average depth of peat over the whole
314 island was assessed at 5 ft. On this basis the deposits would con-
* 195 tain approximately 85 million tons of solids. A survey carried out by the Peat Section of the Department of Agriculture & Fisheries for Scotland in 1952 indicated that the earlier estimates were slightly high.

In 1946-7 the Ministry of Fuel & Power reconnoitred the peat deposits on both sides of the Stornoway-Barvas road and indicated that these were suitable for large-scale utilisation. Yet today, despite these Government-backed investigations, the peat deposits of Lewis are still used only for domestic fuel. One of the points made in a 1952 survey was that the area was generally firm enough to take the weight of various bog machines for digging and milling. Another point was that the calorific values of ten out of twelve peat samples were in excess of 10,000 BTU/lb.

CLIMATE

132 The rainfall has already been mentioned, averaging an annual 43 inches, according to readings taken at the Meteorological

2 ECOLOGY AND PHYSICAL ENVIRONMENT

361 THE population of the island huddles round the coastline
• 133 as round a central hearth. This is mainly because the inland parts of the island are either barren, as in Harris, or infertile bog, as in Lewis. Much of the south Hebrides has, on the west coast, the extremely fertile macharland, but Harris and Lewis do not have these useful patches. The macharland is land built on shell sand and dressed with fertilizing seaweed; it forms a fertile fringe, no more than a belt of varying width between the sea and the acid peat bog on the inland side. Where this land does occur, mainly on the west coast of the island, townships crowd round it for the good growing it can give. The other reason for the
[262] attraction of the coast is the obvious one: the close proximity, on the doorstep, of a change of diet, shellfish and inshore fish such as whiting, cod, haddock and mackerel. The exceptions to this coastal grouping are Achmore, Cliascro, and Lochganvich in Lewis.

133 There is a great physiographical difference between the east and west coasts of the island, this apart from the incidence of macharland on the west coast. The eastern side is steeper to the sea; though sheer cliffs occur at Gallan Head, West Loch Roag. The south-western coastline has high, almost sheer cliffs with few inlets or sheltered harbourages excepting Loch Roag, a magnificent inlet, sheltered at its farthest inland penetration by Great Bernera. The coast on this island side often presents rocky teeth to the Atlantic's buffeting; and often suddenly falls down to sea level to display wide stretches of sand. Uig Bay, where the Red
[463] River runs into the sea, is a breath-taking sweep of whiteness. The eastern coast is generally rocky but has more inlets, lochs which carry townships mainly engaged in fishing or tweed manufacture.

172 of these prehistoric remains indicates that before the Christian era began the island supported a considerable population. Generally speaking, the remains left by unrecorded history indicate three phases of cultural and economic development: the Stone Age, the Bronze Age, and the Iron Age. The dates usually associated with these 'ages' are approximate where the island is concerned. Because of their remoteness and isolation, the inhabitants may well have reached, say, the Bronze Age state of civilisation at a much later date than did people living in more direct contact with civilising influences. It has been conjectured that, where Lewis is con-
• [133] cerned, peat several feet thick may have covered much of the
[124] ground which, in another time, was cultivated and lived on; and that the peat blanket hides the remains of very old constructions. Chambered cairns, duns or forts (round towers) built in lochs, by the seashore and on promontories, galleried duns, earth houses, standing stones, stone circles and ecclesiastical ruins are all to be found.

[112] The duns, or brochs, are believed to have had a defensive function, acting as lookout towers. Primitive dwellings would have been scattered nearby, with generally free-ranging livestock. If attack threatened, inhabitants and cattle together entered the tower, whose double walls held rough but welcome compartments for temporary living during the siege. Sometimes a dun was built on an islet in a freshwater loch, such as Dun Cromore in the Lochs district of Lewis; there is a similar example in Loch Bharabhat in Uig. A stone causeway connects each with the nearest point on the loch shore. Many of these causeways had a rocking-stone, a stepping stone so placed that the weight of a foot on it rocked it enough to warn the inmates of the dun that someone was approaching.

The most famous of the round towers is at Carloway, perched on the crest of a rocky slope on the west coast of Lewis near the crofting township of that name and overlooking much of Loch Roag. Its average external diameter is 47 ft, the walls varying in thickness from 10 to 12 ft. Though in a ruinous state, one side of its wall is still some 30 ft high. Dun Carloway is, after the broch on the Shetland isle of Mousa, the finest example of its kind in the country. About eight miles from Carloway, at Bragar, is Dun

8 STORNOWAY

632 825 STORNOWAY is the only real town in the Hebrides. Some even say that it is the only real town in the world, as its basic living patterns are those of the countryside from which it sprang. It has always been held in high regard by the [539] islanders. In the past it was regarded as one of the most important places in the civilised world: a saying attributed to a primitive native has passed into a proverb: *'Stornoibagh mhor a' chaisteal —baile 'n modha 'th'air an t-seoghal gu leir ach Bail'-ath-Cliath an Eirinn—'s iongantach nach eil an Righ fhein a' tighinn a comhnuigh ann!'* ('Stornoway the great, with its Castle, the largest town in the wide world, except for Dublin in Ireland; surprising it is that the King himself does not reside therein!') The affectionate [105] name for the town is 'Portrona', Port of Seals, which it is. A son [504] of Stornoway once said, 'The founder of Portrona must have been some sea rover with a good eye for a refuge from the storm and the peril of his calling. No matter what winds rage outside, within the bay the mariner may drop his anchor, furl his sails, and take his ease.'

*195 When the Vikings first came to the western isles of what was 132 later in history to become Scotland, they found a sandy spit of • [133] land on which they could beach their longships in a sheltered bay. It was, however, more than a haven; it was a place in which to settle down and rear the first of many generations. Later the Norse-derived MacLeods took advantage of an outcrop of rock beside the beach to build a fortress. Later again a greenheart pier, [504] and later still a concrete wharf, have given the town the outward symbols of economic and social significance.

632 Stornoway owes its origin to the Stornoway Beds, a sedimentary 133 formation much younger than the Lewisian gneiss. These Beds have had two effects. First, their existence and formation allowed a deep indentation, giving a good harbour with a protecting isthmus not far way. The harbour itself is due to the erosion of these

STORNOWAY

rocks about intrusions or dykes of more resistant crinanite. Second, 632 the better nature of the soil derived from the weatherings of the • sandstones and conglomerates has aided reclamation and cultivation.

In the long years of its existence the town has been a focal point 195* of island history, fanning out to many corners of the world, where 632 it has been merged with the wider history of Britain, the Commonwealth and elsewhere. Detached as it was from the rest of [181] Scotland by the Minch, Lewis often went its own way. In the 195* reign of Queen Elizabeth, when England and Sweden plotted 432 against the Scottish crown, the emissaries of these countries met 248 in Stornoway. Later, in April 1719, a council of war was held in a room in Stornoway to plan the counter-move of the Hanoverian dynasty of Britain; included in the assembly were the Earl of Seaforth, the Marquis of Tullibardine, George Keith, the hereditary Earl Marshal of Scotland, and his younger brother James, who was to become the famous Marshal Keith. Prince Charles Edward, though not setting foot in the town, looked at its twinkling lights from across the Bay, at Arnish, while his pilot tried to obtain a boat to take the royal fugitive to France.

The harbour has seen many kinds of ships on its waters. In 504 the twenties, the *Metagama*, the *Marloch*, and the *Canada* came 501 to take away almost a generation of young Lewis folk to the new 532 lands across the seas, because their own island could not support [167] them. The *Islaire* sank within sight and sound of the harbour mouth and dragged about 200 Lewismen with her into an island memory. The *Cerrona*, of Dundee, dropped her anchor just by Arnish lighthouse in July 1904, carrying survivors from the emigrant ship *Norge*, sunk at Rockall with appalling loss of life. The *Victoria and Albert* visited Stornoway in September 1902, [143] the first visit to the town by a reigning monarch. That was a great 701 day, the result of a letter from Provost Anderson of Stornoway in which he pointed out to His Majesty, King Edward, that with less than 30,000 inhabitants Lewis had 2,300 men in the Royal Naval Reserve, trained at the local Battery, the largest in Britain. There were also 1,100 men in the Seaforth & Cameron Militia, all of whom volunteered for foreign service in 1899, and 900 of whom did garrison duty in Egypt. Between 300 and 400 Lewis-

9 A HARRIS VIGNETTE

131 LIKE a Siamese twin, Harris is joined to Lewis in eternal • [133] geographical union. The junction is at the body, however; the head of each island part has always been clear to develop its own characteristic. Thus, Harris has a quite separate personality which has risen above the common factors it has with Lewis. Both have the same historical origin: the Clan Leoid. 614 This clan comprised two leading tribes, the Siol Torquil (Mac- *195 Leods of Lewis) and the Siol Tormod (MacLeods of Harris). [173] Tradition has accorded to them a common progenitor, Leod; though by the time history in the Western Isles was old enough for the recorder's pen the two tribes, or families, were distinct and independent of each other. Malcolm, son of Tormod MacLeod, head of Siol Tormod, had a charter from David II for the lands of Glenelg, on the Scottish mainland, which he and his successors held from the Crown. Also included in his possessions were Skye and Harris, which came to his family after the forfeiture of the Lords of the Isles in 1493. The MacLeods of Harris are, rather strangely, their clan seat at Dunvegan on Skye, and are more commonly known as the MacLeods of Dunvegan or Skye, though 'of Harris' is their correct title.

The MacLeods were, by and large, good proprietors. They held much fertile land and the clan was reasonably wealthy. Tenants' rents were paid mostly in Scots money and, to a lesser extent, in such farm produce as oats, barley, cheese, butter, wedders and marts, and in labour service. Where times were hard for the tenants their rents were often 'eased' by the chief in the hope that subsequent years might prove more fruitful and that the eased rents would be paid in time. In 1705, a bad year, MacLeod actually cancelled 'cases' owing by the Harris tenants, as a gesture to them. In 1712, when some disaster had visited the St Kildans (the islands belonged to MacLeod), their chief provided them with a new boat and the islanders were allowed a two-year delay in payment of their rents to help the recovery of the community.

A HARRIS VIGNETTE

Other tombs inside the church include that of Mary MacLeod, 195* a burdean of the seventeenth century who was also governess to 216 the young MacLeods at Dunvegan. She was probably the first to 764 compose what may be called the 'court' song, in simple words [533] and in the 'strophic' verse-form of rhythm and assonance enjoyed by all Gaels since her time. Her last elegy was composed to Sir Norman MacLeod of Berneray in 1705.

So far as personal characteristics are concerned, there is a 131 marked difference between the Herrach (Harrisman) and the 149 Leodhasach (Lewisman). Their Gaelic dialects are different, the Harris pronunciation being much softer, with an attractive singing lilt. And Harris Gaelic has fewer words of Norse origin. The main reason for this difference has been a topographical one: before a road was cut, the mountain barrier of north Harris divided the inhabitants of the two parts of the same island, who developed in their own distinctive ways.

The character of the land of Harris has also had much to do 181 with the difference. Harris for the most part is infertile, with great 133 • expanses of rock outcrops. The east side of the island is torn in shreds by fiord-like sea-mouths; the west coast is slow-moving, with large expanses of sand and machar-land which look out over the Atlantic breakers rolling from a sea that is oceanic in appearance and in fact. From early times the Harris folk have 195* had to work hard to scarify their snippets of land to make it fer- 181 tile. Regular increases in population forced them to cultivate land 153 extending up to 500 feet above sea level. Some 236 acres, in the 241 form of hard-won lazy-beds. After the clearances early last cen- (126) tury, when the more fertile lands on the west coast were taken over for the formation of sheep farms, the people concentrated on the eastern side of the island, and on some of the higher ground in the west.

On Lord Leverhulme's death in 1925 the ownership of large 423 tracts of Harris passed to absentee landlords. After this, some of [169] the lands which had been cleared in earlier years were purchased by the Government and broken up into crofts again, enabling some of the indigenous population to come back to make 423 use of the more fertile lands of the west. There are some 350 241 crofts in Harris, with 29 regulated common grazings; the total

A HARRIS VIGNETTE

423 acreage of regulated common grazings amounts to 65,000 acres. 241 The working units (as distinct from crofts) in Harris are classified according to the arable acreage; the majority have up to 10 acres arable land. Less than 250 acres of land have been improved.

162 1931

1961

The age structure of the Harris population in 1931 and 1961, showing the decline in numbers and rise in age

631 There are four districts in Harris: North Harris, with its islands; the Bays of Harris on the east coast; the Leverburgh area, with the islands of the Sound of Harris; and the west coast. • [133] North Harris is mountainous country, dominated by the Clisham

A HARRIS VIGNETTE

(2,620 ft); grouped around this are the lesser peaks staring stark (31) and treeless to the skies. At the feet of these hills are the small 133 • villages straggled along the shores of West Loch Tarbert. Much of this area is owned by the proprietors of Aultnamain Castle, a magnificent structure built by the Earl of Dunmore in the last century; the hills lying north of it are rich in red deer. The road [191] past the castle trundles on until it peters out at the far-east village of Hushinish, beside a glorious miniature-like curve of silver sand. Beyond Hushinish is the Island of Scarp.

The road along the shores of East Loch Tarbert ends at the 631 village of Kyles Scalpay which overlooks Scalpay island. The 191 Bays of Harris hold in their centres the scattered groups of houses 241 here and there, where an inlet of the rocky coast affords some 133 anchorage and where a patch of ground is suitable for cultivation. Tortuous, winding footpaths have been gradually replaced by 489 narrow roads connecting the townships. Lack of sufficient re- 161 munerative employment has led to considerable depopulation. 162 Fifty years ago the population of the area was just over 5,400; it is now about 2,900.

The south of Harris is better known for its association with Lord Leverhulme. Obbe, later Leverburgh, became the centre of his schemes. He built a large pier, huge kippering sheds, houses for the workers, roads and lighthouses, and blasted away underwater rocks which hindered free navigation. The bulk of this work was complete in 1924, but when he died (in 1925) his successors, in the cold light of economics, decided to close down the embryo industry and realise its assets. The harbour works had cost £250,000; they were sold for £5,000 to a demolition company. Leverhulme's memorials are still to be seen. The west coast of Harris is now becoming known for the long stretches of shell sand and the green machar-land beside it, a true delight for the tourist seeking isolation.

Tarbert is the central village in Harris, with a population of 631 about 400. It is a thriving community, nestling at the foot of 621 Beinn an Teanga and at the head of the sheltered anchorage of East Loch Tarbert—sheltered from the prevailing south-westerly winds and from the Atlantic storms. The car ferries give direct [505] contact with the Scottish mainland, via Skye, and Tarbert also

A HARRIS VIGNETTE

HARRIS'S OFFSHORE ISLANDS

Scarp

361 Until 1972 Scarp was the most westerly inhabited island in Scotland, separated from the Harris mainland by a strait which is about half a mile across at its narrowest, coursed by strong • [123] tidal currents. The island is about three miles in diameter, rugged, especially in the north and west, with cliffs on all sides; 361 the maximum altitude is nearly 1,000 ft. On the east side lies a 311 tiny marginal belt of good land, machar and soil; on this green [134] shelf, about one-third of a mile long, were all the crofts of the [241] Scarp settlement. Many stand deserted, and abandoned lazy-beds [133] in sites beyond the present settlement indicate a denser population at one time. The island's population-carrying capacity was severely limited by the minute amount of land available for tillage: of a total of about seven square miles only half a square mile can be used. Climatic conditions and soil type also restrict the range and quality of crops grown.

Scarp was originally settled about 1810 and was occupied by *195 eight farming families who were reasonably comfortable. Not 361 only did they have the island to themselves, but they had access [164] to good pasturage on the Harris mainland opposite. About 1823 thirteen small townships between the head of Loch Resort, Harris, and Bunabhainneader were cleared, some of the displaced families coming to Scarp. Some emigration back to Harris took place in the 1840s, but when about 1868 the proprietor divided Scarp into sixteen crofts instead of the previous eight holdings, these were further divided by the people themselves, trying to accommodate their families who had come from elsewhere. In 1861 the population [162] was 151; the peak was reached in 1881 with 213 persons. In 1951 it was 74. Communication with the Harris mainland is by boat, plying between two stone-built jetties.

The local economy was essentially a subsistence one, with self- 133, sufficiency in such products as potatoes, turnips, cabbages, oats, 241 milk and fish. After a break of some years lobster-fishing has 231 recently been reinstated as an occupation. Oil lamps are the only 226 lighting, though a few houses have piped water. The small shop 357

10 THE OTHER ISLANDS

THE continued evacuation of islands is a problem peculiar to Scotland. In the eighteenth century some 8 per cent of Scots lived on islands; today the figure is less than 2 per cent. Island populations today account for about 30 per cent of the total Highland (crofting counties) population. The difficulty for most islands is the relationship between population density and potential for economic development.

As though reflecting the relationship of man to man on Lewis-with-Harris—keeping together in community for survival—the other islands round the larger island mass have played some role at one time or another in recorded history. Most of the socially-significant islands of Harris have been described in Chapter 9. Lewis has very few, and these are mostly far-flung oceanic outliers.

North Rona

To begin at the northern point of the Lewis parish, about 45 miles NNE of the Butt of Lewis is North Rona, a block of hornblende schist with pegmatite intrusions. Though the island has never figured in any Census reports, since the Census began, it has been inhabited from time to time. Of about 300 acres in extent, it is cliff-bound and reaches 355 ft at its highest point. It lies in a part of the Atlantic where a deep swell seems perpetual, and landings can be difficult.

Dean Monro comments: 'Towards the north northeist from Lewis, three score myles of sea, lyes and little ile callit Roney, laiche maine land, inhabit and manurit be simple people, scant of ony religione.' The Dean's 'simple people' were no recent settlers. They were in fact the continuation of a community which had inhabited North Rona for at least 700 years previously. Tradition has it that the first inhabitant was St Ronan, who built a small monastic cell or hermitage there some time during the eighth century, but there may have been earlier inhabitants.

THE OTHER ISLANDS

Account, there was one family there, that of the person employed by the owner to look after the livestock. The owner was a Ness tacksman who paid £4 sterling rent per annum. The island produce was corn, butter, cheese, a few sheep and sometimes a cow, and some wild fowl and feathers.

In 1844 Rona was evacuated, its last inhabitant being, in the seventh year of Queen Victoria's reign, the 'King of Rona', Donald MacLeod, who lived in almost prehistoric conditions. Rona was without inhabitants until 1884, when a last attempt at resettlement was made by two men from Ness. This was a self-imposed exile, after a difference of opinion with the minister of their parish; in penance, they hied themselves off to Rona. In 1885 a relief boat called and found both men dead, one from natural causes, the other from starvation and exhaustion after nursing his friend. By the fireside of their hut was a pot ready for the preparation of a meal they never ate.

Today, man's connection with the island is maintained by the small party of Lewis shepherds who each year make the journey to shear the sheep which still graze on the green slopes around the now-ruined village. Otherwise, only the occasional traveller now lands there. In June 1956, North Rona with its associated rock, Sulasgeir, was declared a National Nature Reserve on account of its importance as a breeding ground for colonies of oceanic birds—guillemots, puffins, kittiwakes, and fulmars—and for its seal colony.

Sulasgeir

Sulasgeir is twelve miles west of North Rona, a lonely rock in the Atlantic, bleak and grassless, and tunnelled by caves and gullies. The only life it has ever supported is seabirds—officially. Yet one of the old buildings is said to be a chapel and is called 'Tigh Beannaicht' (House of Blessing). According to Ness tradition, Sulasgeir was once used as a prison for sheep-stealers, and it is also said that Brenhilda, sister to St Ronan, was left on the island to perish. Yet another tradition claims that it was at this rock that Prince Charles Edward made his first contact with his Scots clansmen, when the ship that carried him to Scotland was spoken to by a Ness boat making for North Rona.

THE OTHER ISLANDS

north-west of Gallan Head. There are seven main islands, all small, high and cliffbound, and a number of rock stacks and islets. All are uninhabited. Eilean Mhor, the largest, of 39 acres, has an automatic light. Dean Monro's description of the islands as 'nouder manurit, nor inhabit, but full of grein high hills and scheipe' still holds, for sheep are taken annually from Lewis to the grazing on the Flannans. Their name is said to be derived from the ninth-century St Flann, whose saintly influence was recognised during the centuries when men from Lewis visited the islands for their harvest of wool, wild fowl and feathers.

The Flannans were the scene of a great sea-mystery: the complete and utter disappearance of three men from the lighthouse at the turn of this century. In December 1900, the lighthouse, with its 140,000-candlepower beam 283 ft above sea level, was a year old. It had taken four years to build instead of the estimated two. All the materials had to be swung up piecemeal from the boats and hauled up the almost sheer 70 ft cliffs to the top. That month a passing ship, the *Archer*, noticed that the Flannans light was out; a message was sent to the Flannans shore station at Breaclete, Lewis, and the *Hesperus*, preparing to pay a Christmas visit to the lighthouse, got under weigh.

Its crew landed and searched the island, but found no trace of the missing keepers. In the lighthouse was an uncanny silence. The fire was dead. The clock had stopped ticking. The beds had been made up in the clean, clinical way of all sailors. And in the galley, the pots, pans and dishes sparkled their welcome to the searchers. In the lamp-room the lamp was cold. The wicks had been trimmed and the lenses polished. The logbook showed a last entry on 0900 hours, Saturday 15 December. In the subsequent investigation some theories were offered in explanation of the disappearance, but none quite fitted. The mystery remains, a haunting, unexorcised cloud hovering over the island.

The Shiant Isles

Turning to the east coast of Lewis, in the parish of Lochs are the Shiant Isles, about 4 miles off-shore, across the Sound of Shiant (Gaelic: charmed, enchanted). There are three islands in the group: Eilean an Tigh (House Island), Garbh Eilean (Rough

THE SHIANT ISLES

Island) and Eilean Mhuire (Mary's Island). The Shiants are the eroded relic of the same age of volcanic activity that formed the strange-looking columns of Staffa and of the Giant's Causeway in Antrim. The mass of cooling molten rock slowly crystallized and changed in composition: the early-formed crystals sank to the bottom, the later ones being found nearer the top. In 1845 one family lived on Garbh Eilean, the largest, which is joined to Eilean an Tigh by a low storm beach; but the family was lost, falling over one of the great precipices which are a feature of the group. In 1821, 2 males and 4 females lived there; in 1891, 3 males and 5 females; and in 1901, 4 males and 4 females. But in this year the last family upped and went to Tarbert, Harris; for one of its members, a girl of 21, it was the first visit to the outside world. Since then there has been no permanent population. Back between 1811 and 1821 a visitor to the Shiants had some hard things to say about the filth and darkness of the shepherd's dwelling in contrast with the 'loveliness of nature, the bright sand, the fair rock, the enamelled green turf, and the sweetness of the summer breeze'.

Records show that at one time in the islands' history some sixteen people lived there, working small crofts. The ruins of their chapel can still be seen. The author Sir Compton MacKenzie had the house on Eilean an Tigh renovated for a stay there, and later the islands were bought by Nigel Nicholson, author and publisher. Today they are used for grazing sheep.

St Kilda

The St Kilda group of islands, some 45 miles off the west coast of Lewis, belong to the parish of Harris. These islands have an extensive literature and can only be touched on here. When the population was evacuated from St Kilda in 1930, the move broke for all time almost 2,000 years of continuous island living; they were taken off at their own request, after much careful and serious deliberation by the St Kilda 'parliament'. Life in Hirta, the only island in the group with a permanent human settlement, depended on the seabirds that breed in their tens of thousands on the cliffs of Hirta and Boreray, and the great stacks of Stac an Armin and Stac Lee. The flesh of puffins, gannets and fulmars

CHAPTER I

ENVIRONMENT AND LANDSCAPE

(a) THE GEOGRAPHIC SETTING: THE BRITISH ISLES, SCOTLAND AND THE HIGHLANDS AND ISLES

1. *A 'Heart' of the 'North and West' of Britain*

IN the 'Outer' Hebrides, commonly regarded as the most 'outlying' inhabited lands of the British Isles, are revealed not only the most ancient of British rocks, the Archaean, but probably the oldest form of communal life in Britain. This life, in present and past, will interest

FIG. 1.—Global view of the 'Outer' Hebrides, seen as the heart of the 'North and West' of Britain.

ISLAND, WORK AND PEOPLE PT. I

some by characteristics which may seem unique. But it will interest others by features of underlying universality. These might be compared to the Archaean rock, overlain toward the south-east by a succession of younger strata, but forming their foundation.

In this rocky land, the roots of Island life are laid bare; the rhythm of work responds to the day's weather and the cycle of the year. Yet the flowering of communal life in song and spiritual tradition may offer a fresh vision of regional, even of national, being. Indeed it is in characteristics latent in the evolution of the whole 'North and West' of the British Isles that Island life is most revealing.

Rising in imagination to a point above the summits of the Harris hills, and viewing the British Isles from the 'far' north-west, we gain a new perspective (Fig. 1). The Island below us is now the nearest; the 'Outer' Isles, the innermost. To us now, as to the Islesmen, their Island home is no mere fringe, but a heart of Britain.

Thence, looking to the lands across the Minch, each further from the Isles of home, there appear, in turn, three regions: (1) the rest of the Highlands and Isles; (2) the Lowlands and Uplands of Scotland; and (3) Ireland, Wales and Cornwall, and Northern England—all sculptured in rocks older than those of the Lowland or 'Plain' of England beyond. These three roughly concentric regions, from Harris to the edge of the 'Plain', may be grouped together with the intervening estuarine lowlands—not only Clydeside and the Solway but the 'firth-land' of Mersey-and-Deeside, and that of the Bristol Channel. To these, one might add the shores of an outer Minch, the *Manche* or 'English' Channel, which once linked Devon and Cornwall to Armorica. Beyond

Britain, on the horizon, the eye may descry the coasts of Scandinavia, the Low Countries, France and Iberia. This far-flung regional grouping within the British Isles—which extends for 800 miles from the Shetland to the Scilly Isles—may be called ' the North and West '.

Four border-lines may be drawn to bound these regions: the hill-foot ' Highland Line ', the Scottish Border, the border of Wales with the Pennine-and-Moorland-foot, and lastly, for the whole, a line drawn from the Severn to the Tees. Of these four lines (or border-tracts), the last, which divides the British Isles into two different types of landscape and life, is not the least significant. On one side lies the whole of ' the North and West ', with its isles and headlands, its mountains and hills, hewn in old rock, and its firthlands, straths and marginal, hill-foot lowlands, all sculptured markedly both by rivers and ice, and heaped with glacial drift. On the other lies the ' Plain ' of south-eastern England, or simply ' the South-east ', of which the low scarplands of younger rocks slope smoothly down to mainly river-sculptured vales, and are bounded by smoother coasts.[1]

Geographically, this succession is one of complexes with recurrent features of height and hollow, land and sea, rather than of sharply defined blocks; its marches are tracts of transition rather than boundary lines. But essential characters of the two zones are revealed by the main boundary

[1] Strictly, the alternation of vales with wolds and downs, which characterises England south-east of the Pennines, would justify the term ' lowland '; but with our Scottish and Highland perspective, the English ' lowland ' appears a ' plain ', and for simplicity, the ' Plain ', or simply ' the South-east ', is used throughout this book. The physical and geological maps of the British Isles in an atlas may serve to illustrate this perspective; they should be viewed from the north-west by turning the map with the north-west islands towards one, and the plains of England and the Continent furthest away.

3: Geddes K-4, 5 (1919-1952) 1955 ES10 Highland Scots
Lewis and Harris

line; and there can be no doubt of the contrast found at the extremes. How strikingly different from any view over the English Plain is this, from the air or a mountain-top! It overlooks the ice-scraped rock of the fells; the drift-heaped, ill-drained hollows studded with gleaming lochs and deeply overgrown with peat; and the indented, insular coastline with its widely spaced crofting townships looking seaward, where a few fishers' sails may dot the vast expanse of ocean. In 1951 the population of Lewis-and-Harris numbered only 28,000 persons, and that of the entire Outer Hebrides some 36,000; but the small numbers need not lessen the geographical significance of the community.

Men have long recognised the homogeneity of the English ' Plain ', with its recurring vale and wold, compact within a rounded coastline. In spite of the local variety of landscape, history or dialect, which enriched its heritage and compose its grandeur and charm, men have sensed the unity inherent in this land of a single tongue, centred upon a single capital. By contrast, the diversities in landscape, life and tongues of the lands far-flung to north and west have obscured the elements of a profound, underlying unity in geographic origins and in historic and social evolution. To understand the civilisation of the British Isles, it is vital first to perceive the complementary qualities found in the two great regions, and face their corresponding weaknesses or limitations. Second, within the less understood of the two regions, ' the North and West ', it is vital to study the almost bewildering variety in regional types of life—distinguishing, for instance, the uprooted populations all too typical of the rural Lowlands of Scotland or Northumberland from the still deep-rooted communities of the Highlands and Isles.

Let us begin with the economic and the social significance of the Highlands and Isles with which we are concerned. Economically the crofters' 'living space' is the narrow interrupted belt of improved land (shown black) which is generally fronted by the sea and its inshore waters, and is backed by the Crofters' Grazings (enclosed by line C on the map). Some 700 crofting townships or communities are found in Zetland, the North-west mainland and the Western Isles, each with its Common Grazing; the line C also encloses a small area devoted to other grazings. Deer forests predominate on the eastern, mainland, side of the line. On the remainder of the hill country are to be found the hill-sheep farms, with other small farms and small-holdings.

Key to use of Land and Sea
(Highland, Island and Urban Areas)

1. The dotted line C .... C encloses the Crofters' Grazings, mainly 'Commons'.
2. Black areas: strips of 'Isolated Arable' within the rough pastures of the Highlands and Southern Uplands (left blank).
3. Horizontal ruling: open sea, outside the 'three-mile' belt of 'inshore fishing' (left blank).
4. Vertical ruling: urban and industrial regions.

Key to Size of Labour-Teams of Farms and Small-Holdings
(in the Lowlands)

The symbols show the average number of employees per team in each county.

(1 symbol = 100 teams)

(a) Per Mixed and Dairy Farm
— 2·2 to 3·8 (3·1)
◆ 4·1 to 5·6 (4·9)
■ 6·4 to 8·2 (7·1)

(b) Per Full-time Small Holding
• 0·7 to 1·0 (0·85)

(The numbers in brackets are the averages for Scotland.)

131 (1) Stornoway stretches from the town north to Tolsta;
632 (2) Barvas from the north of the Island southwards, past Barvas village (WNW. of Stornoway) five miles further to Bragar;
(3) Uig covers the rest of the south-west coast; and
(4) Lochs, the remainder of the south-east coast.

131 Seen from the sea, the Island chiefly presents dark,
133 gneissic, heath-fringed cliffs whose steep walls become gentle slopes towards the south as we enter the bays, sea lochs and firths which run far inland (Plates I to IV). As one sails northward along the east coast of Lewis, there are few hills to be seen, and these are below 1000 feet; most of the island is rolling moor, rarely rising above 300 feet. Here and there new houses stand out, the 'white houses' (*tighean geala*), which, however, are usually grey
342 or even dark in colour. These dwellings have generally been stone-built and were often slate-roofed; asbestos roofs are now common. Yet even when dark, these new cottages are conspicuous beside the low 'black houses' with their rounded forms of wall and roof, and with thatch overspread by a faint haze of blue peat reek, like the bloom
133 upon a fruit. Their plots of corn, though each may be so
[243] tiny as to appear but a spot at a distance, together form a bright patch against the dark brown moor. In the sketch which forms the Key to the Map of Vegetation and Settlements (Fig. 8), an attempt has been made to bring the map and the landscape alive to the mind's eye, from the hills of North Harris north-eastward to the Butt of Lewis.

131 Turning the north cape of Lewis, 'the Butt', and sailing
133 southwards along the west coast, we see hills increasing in height in the Uig district, rising to those of Harris with

131 summits of up to 2622 feet. South of this chain of hills
133 the ground drops again on a peninsula some twelve miles long and only seven miles wide. This forms the more populous part of Harris with its 'sandy shore', the Machar, facing the Atlantic, and its rocky bays and fishing hamlets
[134] on the Minch.[1] Lewis has its 'machars' too, areas of white shell sand, which is so light that it blows up the
[504] hillsides, thus improving the pasture-land; but there is little 'machar' on the eastern coast, save for the south-western shores of the great sandy North or Broad Bay, enclosed by the peninsula of I, or Eye, which also acts as the outer breakwater for the harbour of Stornoway.

131 Landing at Stornoway and leaving behind us the pines,
133 and the wind-pruned sycamore woods around Lews Castle, we find ourselves among the small fields of the
361 villages which are partly suburban to Stornoway. Inland
[137] stretch the gently rolling, brown and somewhat melancholy moors that cover so much of the Lews. From the Butt of Lewis to the beginning of the Harris hills one could make a bee-line SSW., midway through the Island for over thirty miles, without passing a house or a strip of corn, and seeing only a tiny, ramshackle hut, a shieling (or *àirigh*), used for six weeks in the year when the cattle are taken to the summer pasture. All the villages are in sight of the sea, and generally close to it, with only one inland exception, Achmore, south-west of Stornoway, founded after 1850. The hills of Harris are not less lonely than the moors of the Lews.

18 Diversity is one of the fascinations of such an island
131 as this. Although, like the founders of Stornoway, all
133

[1] *Am machair* ('ch' as in 'loch', also anglicised as 'macher'), n.f. the plain, smooth beach-land or links. A sandy beach or ebb-strand, *tràigh*, n.f., backed by *machair*, contrasts with a pebbly beach, *cladach*, n.m., backed by rougher beach-land, as in the Cladach district of W. Lewis.

18 these communities of 'fisher-crofters' settled at the meet-
131 ing of sea and land, yet differences of topography and
133 situation are still accompanied by differences of emphasis in their dual way of life. Although insularity might lead one to presuppose homogeneity, actually the seaways by which an island may be reached may bring groups of different race to land at different spots, each spot appropriate to their way of life. Differing social economies may develop there, and differences of race may be maintained; divergences are found along with the convergence due to the elements common to the whole island and to its
[178] history. From prehistory to the coming of Leverhulme we shall find this crossing of influences in the Island microcosm, the Island drama.

2. *Structure and Rock-types of the Western Highlands and Isles*

133 In Fig. 3 are sketched those features of structure and rock-type which have guided the work of ages of erosion, influencing both the 'plan' and coastlines of Western Scotland and the surfaces and scenery of the land. In their turn, both surface and mineral composition have influenced the life of plants and animals. This sketch map should be compared to an atlas map of relief, settlements and routes. This less familiar aspect has been selected both because rock-type is a factor in the causation of land-forms and soils, and because rock structure is basic to the forms and coasts of the mainland and the Isles.

[131] The parallelism of the main trends on either side of the Minch is seen in the structural boundaries of its coasts, which are of Archaean rock or Archaean foundation (A on Fig. 3), as are Coll and Tiree, and South-west Islay.

102
131
133

FIG. 3.—Sketch map of selected features of structure and rock-types of NW. Scotland

133 Except for this fringe, the prevailing rocks of the Highlands include acid rocks: the Moine Schists, the 'Dalradian rocks' of the South-west, and the granite masses such as the Cairngorms. Plateau surfaces and benches, worn, uplifted and stepped at various heights, were veined by torrent and river, cutting narrow valleys; and later these river valleys were gouged and widened by glacier and ice-sheet to become steep-sided glens and wide-floored straths.
131 Between the main, parallel coastal trends, Skye stands out as a great extrusive mass of lavas—not acid but basic in composition, almost 'bridging' the Minch and the Sea of the Hebrides.

Forces of stress, strain and shear are betrayed by 'lines of crushing' in the Outer Hebrides, and of faulting (FF) on the mainland. Most notable of these fault lines are those of the Great Glen and of the 'Great Boundary Fault' that divides the Highland from the Lowland rocks, extending from Arran and the Lower Clyde north-eastwards. Still other trends are revealed by the lines of sea-loch and river, lying not only SW.–NE. but W.–E. and also NW.–SE. These lines linked the greater inhabited coastlands, loch-sides and straths of the Moray Basin to the North-
131 west. Finally, a line of overthrust, from near Cape Wrath

Note. The map shows selected features relevant to the structure of the Hebrides and the north and north-west of the British Isles, and the rock-types influencing scenery and surface, vegetation and agriculture.

133 southwards to Skye, bounds the Archaean gneiss and the
131 stratified Torridonian sandstones of the North-west.

Given the possibility of 'continental drift', Scotland's NW. crustal block may have 'drifted' along the line of the Great Glen south-south-westwards for a distance of some sixty miles, relatively to the rest of the Highland mass. The primary evidence leading to this suggestion is the identification of the Foyers and Strontian Granites, situated on opposite sides of the Great Glen some sixty miles apart, as mechanically displaced portions of one original mass. Such horizontal movement may be related to the great Hercynian mountain-building movements of Carboniferous times so marked in south-east England.[1] This movement would have formed a major factor in leading to the development of the present structure and rock-types, plan and land-forms of the NW. coast and the Hebrides, Inner and Outer.

3. *Structure and Rock-types of the Island*

The axis of the Island lies NNE. to SSW. It consists of an ancient rock mass, the 'block' character of which is revealed by the geometrical mosaic of the coastlines and lochs. In simple terms, the fault lines are comparable to the long, fairly straight cracks to be found in any hard block of even consistency, split under stresses and strains. These systems of faults lie in at least two main directions. The main, axial trend is followed by South Harris and by much of the east coast. Each trend seems to have other faults lying at an angle to it, though not necessarily at right angles. Hence we find more than four main trends for the lines of coasts, lochs, rivers, bounding the hill blocks. These must be due to somewhat different stresses

113 [1] W. Q. Kennedy, *Q. J. Geol. Soc.*, vol. cii, part i, 1946 (p. 41).

133 and strains at succeeding periods. Comparison should be made with Fig. 4, (*a*) and (*b*).

Like a jointed claw, there is attached to the main island the double peninsula of Stornoway and of Eye: *I* in Gaelic, or 'Point District' in English. This double peninsula is of different structure and rock-type to the rest. Eye or Point District itself might be an island but for the wash of shingle and sands which—caught no doubt in the eddy caused by southerly gales and by the tides—have covered the bottom of Broad or North Bay and formed the spit of sand or isthmus that links Eye to the inner peninsula of Stornoway.

Most of the area is occupied by crystalline rocks belonging to the oldest known division of British rocks, the Archaean or the 'Lewisian Gneiss'. This gneiss, however, represents a great complex including rocks of widely different periods. In South Harris it includes altered limestones, locally improving the derived soils. Of notable interest as a clue to structure is the zone of crushed gneisses bordering the Minch.

In the south-west of Eye Peninsula, and round Stornoway, there occur remains of a sedimentary formation, younger than the Lewisian Gneiss. These Stornoway beds have had a dual effect on settlement. First of all, their existence and formation have allowed of deep indentation, giving a good harbour with an isthmus not far off. Stornoway harbour itself is due to the erosion of these rocks about intrusions or dykes of more resistant crinanite. Secondly, the better nature of the soil derived from these weathered sandstones and conglomerates has aided reclamation and cultivation.

Comparison of the geology with the relief (Fig. 4, (*a*) and (*b*)) will show certain local correspondences of high relief with resistant rock, such as the granite-gneiss at its

Lewis and Harris

131 Before the making of
174 roads, it was ease of sailing which united island peoples
[491] and their territories. One can wade or drive, at low tide,
[505] over the fords that unite the Isle of Benbecula with the
[491] two Uists, North and South: in fact, a bridge now connects Benbecula with South Uist. But only the roughest of hill tracks led through the hills of North Harris from the 'Tarbert' or Isthmus of Harris to the nearest habitation at the head of Loch Seaforth or Loch Erisort, in the Lews. This is a distance of some twenty miles, or a fair day's tramp for an unloaded man, and far too much for a return
[823] journey in one day. Hence separation of territory and name was natural. This separation no longer exists as
131 there is now a good 'bus service from Rodel via Tarbert
178 to Stornoway which links Harris with the daily Kyle to
823 Stornoway steamer. In this book, the Island, or the
494 Islanders, refers to Lewis-and-Harris with its people, as one.

101 Lewis is included in Ross-shire (of which the county town is Dingwall, north of Inverness) and Harris in
131 Inverness-shire, together with the rest of the 'Long
634 Island'. The county boundary cuts across the six-mile isthmus north of the hills of North Harris, from the in-reaching Loch Seaforth WNW. to Loch Resort (Fig. 8). All the Outer Hebrides are now included in the Parliamentary constituency of the Western Isles. Proposals to unite the Island under one District Council, or the Outer Hebrides under one County Council, are more favourably viewed in Stornoway than in Harris or the
632 Southern Isles. Harris forms one civil parish, while Lewis is divided into four: Stornoway, Barvas, Uig and Lochs.
[133] The Lewis parish boundaries traversing the moors are inset
[131] in Fig. 8 so that their trends can be readily grasped, and the inhabited portions of the parishes quickly located (p. 50).

133 tively to the rolling upland in the north. Ages of 'normal' denudation by running water must have worn away most of what later rocks may have overlain the gneiss, smoothing the Island's forms. Glaciation, however, played the latest part in this process, roughly planing its lower surface as it flowed out to the open sea, or widening the stream-veined valleys and gouging out the corries which make the craggy beauty of the Deer Forest of Harris.

A characteristic of many of the lower hills of South Lewis and of Harris is the greater steepness of their slopes to west than to east (or south-east) and the drift material heaped there. Scenically, this lends a feeling of rhythm to the skyline when viewed from north or south, as of westward moving waves. It was the ice-sheet, working upon structure and pre-existing form, which steepened the western slopes 'to lee' of its westward flow, by its 'plucking' action.

133 137 [182] [134] The chief and most important characteristic of the major surface of the Island is its rolling, hummocky topography, so different from that of a river-sculptured land. Negative as is its influence upon the life of plant communities, animals and men, its importance can hardly be exaggerated. Whereas river and stream drain a land, as they etch their way into its surface, and their deposits are laid down in gentle, regular slopes, glacier and ice-sheet leave an irregular, ill-drained surface. Upon this surface, waterlogging takes place, the life of plants and soil bacteria is slowed down, and so peat accumulates, rather than the humus which might enrich the soil in a similar temperate climate upon better drained slopes. Not only the climate of the present, but of the past, hinders the processes of plant life, and all that these can mean to man.

133 Except for the sandy bays hidden beyond the headlands, or the long machar of west South Harris, the coast of the Island at high tide rises straight from the undermining breakers, rugged and uncompromising. A series of sandy 'storm-beaches' links the lower promontories, but the series of raised beaches found on the mainland and the inner isles seem absent round the Island. Along the western mainland and the Inner Hebrides, a secret harmony links the lines of the sea with those of the land, even on their wildest coasts of gneiss. Above the level plane of the sea, the shores of the mainland rise in rhythmic curves, tier above tier, some 10, 25, 50 and 100 feet, above the present line of waves and the triple band of colour which marks the shore at ebb-tide, formed of golden tangle, grey barnacles and pitch-black rock. These tiers are the 'raised beaches' of a coast which has emerged, by stages, to some 100 feet above the sea.

Lacking the raised beaches of an emerged coast, the Outer Hebrides show no clean-cut terraces like those of the mainland, inviting little communities to lay out their homesteads in an orderly way. For this reason, the older, unplanned crofts spot the landscape in an irregular way which is sometimes picturesque, yet often almost uncouth. The raised beaches have given the Gaels living east of the Minch a few precious acres of passable ploughland which would otherwise be lacking. In the Outer Isles compensation is found on the smooth machars of shell sand. These machars lie mostly on the stormy Atlantic shore, so that the more cultivable fringes of the Outer Hebrides turn their back to the mainland—except round Stornoway, a reason for their isolation.

[241] [361] [134]

In detail, the coasts may be grouped in three types: (1) sloping to the sea, by the sides of sheltered lochs;

142
291
133
417

PLATE XII. A MOTHER AND CHILD AT TARBERT, HARRIS

/facing p. 93/

194
613 of the Norsemen, lay a succession of earlier periods. A
172 phase of primitive settlements is traceable in archaeo-
logical remains and in recent and contemporary survivals.
174 It is shown in the physical race-traits distinguishing those in one part of the Island from those in another. Fragments of tradition telling of the first Christian missionaries survived the Norse invasions and settlements, dated from A.D. 800 or before, down to Haco's defeat on the Clyde at Largs in 1256. These fragments can be linked to chronicles and to later tradition, on which they throw fresh light.

(144) A survey of the archaeology has been published,[1] but comparatively little, as yet, on race. Yet different communities are distinguished by marked racial types or strains. Although many, indeed most, of the race-strains of the Island must have entered it in prehistoric times, some are linked to tradition, and history accounts for the more
(141) recent immigrants. The striking element of race in the Outer Hebrides is a broad-headed type prevailing from Barra to the Lews, accompanied by medium stature and dark hair; it is also found across the Northern Minch. But within the Island are notable differences.

829 Variety of race being accentuated by difference in ways, the communities still comment pointedly upon one
(538) another! For instance, an old saying is not forgotten: "The folk of Cladach, but the gentlemen of Uig!" (*Muinntir a' Chladaich, ach daoin' uasaile Uig*),
(433) 'Cladach' being the western 'Beach' district possessing
(632) ploughland but poor fishing, which covers the modern
(133) parish of Barvas (excluding the north-west cliff-promontory

(113) [1] Royal Commission on Ancient Monuments, *Outer Hebrides, Skye* etc.); 1928. V. G. Childe, *The Prehistory of Scotland*, 1935; *Scotland Before the Scots*, 1946.

829 of Ness), while Uig is the most westerly promonto
(433) its natural fishing harbours. The authorship of t
(632) verb may be ascribed to the ladies and gentlemen
(133) yet the personal appearance of the victims, who a
broad-headed, gives the proverb a physical four
174 Again, the tall men of Ness, dark or fair, and rather
172 headed, still form a group apart from those of
141 each having taken root in prehistory, *i.e.* earli
surviving record.
144 Such facts correct several current misconceptio
race and heredity in their relation to Gaelic socie
and possible. First, it is still common to co
'Celtic' with a 'Norse race'. Now, Norse im
belonged to several races, and when they arrived,
race-streams were already mixing and eddying
Isles. After the immigration of Norsemen, the
corded was in 1611, consisting of gentlemen-tacksm
Kintail and burghal settlers to Stornoway, who we
posed of Gaelic-speaking families from Easter Ros
the people of today resemble some Scandinavia
rather than typical broad-headed Lewismen.

Second, it follows that no sweeping generalisat
yet be made as to the ways and habits of particul
The "Celtic race", one reads, have "never take
sea" as have the Norsemen.[1] The facts in the Is
that though the men of Ness, with a possible N
mixture, were considered better fishermen than
Cladach, and the present generation includes
number of seamen, their opportunities have bee
—their cape commanding wider fishing grounds
little port providing relative safety in storm. And
of Lochs and of the 'Bays' of Harris, though th

[1] For example, in the Brand Report on Lewis (1902).

172 of the Isles, and in which the people met, though far from
178 any clergy. On the southern mainland most trace of
346 shrines and chapels seems to have been lost, so small are
[771] the rings of unhewn stone that marked their sites. Little
175 was recorded by salaried clergy about the services conducted
814 there; those who approved tended to let well alone. Hence
written accounts have come down chiefly from those who
were out of touch with rural needs or ignorant of the
language spoken in intimacy, and whose alien training had
[217] removed them from sympathy.[1] As for those whose private
interests, stipend or subservience to patrons bound them
to prelate, lord or king, they roundly condemned free
congregations.

175 Nevertheless, fragmentary records have come down,
814 such as those of Martin, who visited St. Kilda in 1697 and
described the little church where the people still kept a
771 fine brass crucifix and worshipped together, without the
[184] presence of a clergyman. Naturally, the curiosity stimu-
lated by St. Kilda's fabulous isolation led Martin to de-
scribe its little community more fully than any other; but
he mentions similar worship elsewhere. Thus in lonely
North Rona, inhabited by only five families, Martin had

[133] [1] The difficulty of initiation to intimate usages of language is exemplified
in a scholarly and patriotic work, the *Dictionary of the Gaelic Language*
(Gaelic-English, and English-Gaelic) by Malcolm Maclennan, D.D., 1925.
[192] This standard work incorporates all the words of three previous dictionaries,
with many additions. Yet key words of the people's religious heritage, of
immemorial age, of living usage, and recorded a generation or so before in
the collections cited here, are either absent, or are given the more prosaic
or debased of two shades of meaning (not the *higher*). See "*caim*, a case,
sheath" or *shrine*; "*tionnsgann*, a beginning" (a *dedication*); *earna*,
Hail or *salutation*; "*ora*, *orra*, or *ortha*, a charm . . . amulet . . . or
imposture of any kind . . . Irish . . . prayer in verse—from Latin,
oratio" (why prayer in 'Irish' only?); and other vital words. According
to this scholarly dictionary, the title of the supreme Scottish collection of
Gaelic religious tradition, Carmichael's *Ortha nan Gaidheal* (Latin, *Carmina
Gadelica*), is to be translated, not *Prayers*, but "*Charms* . . . or Impostures
. . . of the Gael"!

128 enclosing all, the zone from Severn to Tees. Having po
18 trayed the environment and life of the Island—' innermos
of the regional series, the next step was to extend th
survey beyond the Minch to the Highlands and Isles
a whole, and then to compare these with the regions e
tending south-eastward—' outwards '—from the Isles
the margin of the ' Plain ', through the regional series
group as ' the North-and-West '.

121 Two main tasks lie before us in making comprehensi
community surveys, once the geographical basis is esta
lished. The first task, historical in method, is the redi
[133] covery of cultural foundations. These might be compar
(as we said at the outset) to the Archaean gneiss laid ba
only in the North-west, but still the foundation, albeit
hidden one, of the ice-sculptured rocks of Highland Brita
from the pre-Cambrian to the coal at the margin of t
overlying, differently sculptured rocks of the ' Plain
Understanding of the past can help us to understand n
only the evidence of the present, but latent, underlyi
powers. Regional traditions, dormant for one, perha
for many generations, may germinate afresh if we c
understand the conditions in which they once grew a
also those needed to awaken them to new life in finer form

The other task of social survey must be to recogni
the communal efforts of the present, and with eyes u
dimmed by prejudices of class or culture, grasp the relati
of personal efficiency and self-realisation to life in tea
or groups. The inherent cultural interests of the peo
of each region in work and leisure must be evaluate
Underlying actual achievements, latent powers may
discovered which must be freed for communal attainme
Better work under better conditions should bring ab
the flowering of personality in harmonious communiti

PLATE XI. AIR VIEW OVER STORNOWAY HARBOUR, LOOKING SOUTH TO HARRIS

The original central street of the Point can be seen (cf. Plate II and Fig. 12). The woods of Lewis Castle lie across the Bay, with Arnish Moor beyond

/facing p. 92/

clay is exposed, leaving what is vividly called 'skinned' land. And where drift is exposed, the mineral constituents are leached out, and a hard 'moor pan' is left a few inches below the surface.

Seen from the edge of the crofts, the typical 'skinned lands' of bare, blue or brownish clay, littered with stones, suggest a desert. Often, only a few blades of grass or tufts of heather grow on them. Indeed, 'skinned land' seems at first too mild a term, for on it the stones—thickest on top when undisturbed, and bleached by the acids of the peat that overlay them—suggest the prophet's 'field of bones'. One can only ask, is the rest of his vision ever to be fulfilled and life to spring again? In some hilly parts to south and west, not only the 'skin', the topmost layer of peat, but the very soil, the flesh as it were, is still being stripped bare to the bone, the actual rock. The evacuation of the islet of Bernera Beag (Uig) was largely due to this stripping. In the more level parts to the north, however, roadside pits show sections of clay with few stones, covered with perhaps six inches of clay with many stones. It is this top layer which gives the skinned land such a hopelessly stony appearance, and shows that reclamation is less miraculous than it seems.

With the coming of carts and lorries the increasing use of shell sand has become possible, whether for spreading on the land or for slipping into pockets, together with fertilisers, for potato seed. As to soils, shell sand and boulder clay possess complementary qualities in texture and chemical composition. The shell sand of the machars provided an early home for man, the light soil allowing rye, a poor variety of oats, and herbage, to ripen early and mature in late, wet seasons when the clays are sodden with rain. Yet the sand itself is so light that drought is

2. *Plant Life in Lewis-and-Harris*

Lewis has been dismissed by many as a floating peat bog, and its name has even been derived from *leodus*, a bog! For good or ill, peat influences the Island, its history, the distribution of its people and the economic and social features of their life. In Lewis, peat once covered everything except the narrow fringes of sandy machar, the surface of the inland waters, jutting rocks and steeper hills where drainage is rapid. Man's encroachment on that carpet has so far been mere nibbling. Except for the machar lands, every acre of ground occupied or cultivated by man has been reclaimed from peat.

133 137 182 [185] [311]

137 The Map of Vegetation and its Key portray the distribution of the main plant communities (Fig. 8).[1] All plants are of low habit with small leaves, well protected from excessive transpiration. They are mostly perennials or biennials; annuals are comparatively few. There is no burst of flowering save where the heather blooms on better-drained slopes, or where shell sand has blown, enabling clovers, vetches and meadow-sweet to give colour and scent. Moss, sedge and dwarfed heather prevail widely in tussocks.

137 Constant cropping by sheep and cattle, and also deer, tends to keep vegetation low, but on the wide, boggy moors this is a minor factor. Nor is there much systematic heather-burning. Even upon the islets of inland lochs, untouched by grazing animals, and in spite of better drainage due to the undercutting of the waves, growth is not really luxuriant. Bracken, however, is found on the islets, and a little on some former sheep farms, but not on the heavily grazed common pastures, for cattle keep down bracken.

/p. 50/

there is frequently found the most thriving of the vegetation types of Lewis and the best grazing ground. It includes grasses such as those already named, together with purple *Molinea*, meadow soft grass (*Holcus*), and mat grass (*Nardus*); sedges (*Scirpus* and *Carex* spp.); with the field wood rush (*Luzula*) and a fair number of flowering plants. Heather is common in this and the following community (3).

With true 'hill' pastures, found especially to the east of the Forest of Harris and between Loch Seaforth and Loch Shell, are included fair pastures with good grasses on the rocky hillocks near the villages around Loch Roag and also on the low, steep hills northward to Shawbost. The 'skinned land' lies in strips too narrow to be shown on the map, but may form a ring of desolation round the village. The hard moor-pan resists natural seeding of plants unless broken by the pick, but broadcasting of a cheap seed-mixture with a little fertiliser can work marked improvement.

(3) *Marshy Grass Moors.*—Where the slopes are gentle, and the acid humus has accumulated to form peat, is found coarse, tussocky, damp pasture, of sedges and grasses, grading from the 'fair' and 'hill pastures' to the beginnings of hummocky peat hags and smooth sedge moss. It covers the slopes of hills such as Ben Barvas and Muirnag and the hillocks that emerge from the great central trough of brown peat moor. It also characterises the low but broken areas in southern Lewis. This type forms a belt below the 'hill' and 'rocky' pastures of Harris. At its best its prevailing hue is olive-green turning to a silvery shade and then to russet later on. Annuals are few and the grasses are coarse.

(4) *Peat Moors, Mosses and Peat Hags.*—The most

widespread plant community in Lewis is undoubtedly the *sedge and cotton grass moors* (or 'mosses' as they would be called in the Lowlands), which overlie deep peat generally at low levels, on flat or slightly rolling grounds. The peaty floor is waterlogged and boggy, and the carpet rises into tufts, dense cushions or mops, out of which bristle innumerable stalks, thread-shaped, sheathed, fibrous and elastic. There are few flowers apart from the bog asphodel, while heather does not thrive but is stunted. On the slopes, sedges (*Scirpus* and *Carex* spp.) and cotton grass (*Eriophorum angustifolium*) dominate, and in the hollows, sphagnum moss. Owing to slope and consequent erosion, the surface may break into hags (or 'bruachs'), separated by deep and more or less broad channels of bare peat with puddles.

For reclamation by tractor and peat plough, smoothness is essential, combined with some slope for drainage. From observation of the fragments of poor pasture topping the hags in channelled eroded peat, it can be noted that drainage alone is not enough to create good pasture, though it is the first step. In order to complement the work of drainage, fertilisers must be applied to encourage plants which absorb water in quantity and transpire it freely in the course of rapid growth. For it may be said that plants like heather—adapted to withstand drought, physical or 'physiological'—do not transpire water in any great quantity. Thus they fail to 'drain the ground from above', as juicier grasses or fodder plants do by the vigorous ascent, transpiration and renewed absorption of water.

(5) *Heather Moor.*—The common heather (*Calluna*) dominates on many steep slopes and rocky bluffs, sometimes on acid humus, or again on decomposed rock and screes, generally at low levels. Among the chief plants

away, and for a shorter period. The sheep wander over the moors all the year round, though they hang about the crofts when the winter is severe.

A comparison with mountainous Norway or the Alps and their high summer pastures suggests itself; but in Lewis altitude is almost negligible, and the shielings may lie only two to five hundred feet above that of the crofts beside the shore. The difference between winter and summer is in any case less, snow being rare and the conditions being such that even in summer the shieling pasture remains poor. Hence it is that while modern Norse and Alpine economy still maintain the summer pasture, the shielings have died out in the Highlands and are slowly decaying in Lewis. Seasonally, stock are transported over longer distances, from Highland to Lowland pastures.

Reasons for the continuance of these and other crofting ways, or for their abandonment, are not of an economic order alone: not only the remuneration received for labour, but the feeling for the work counts enormously. Visiting a couple of distant shielings in the summer of 1919, I found that two lads newly home from the Navy had come up from their village 'for a holiday', bringing rods for trout-fishing and high spirits for play. By day they fished or flirted. By night they slept in one of the two shielings, while the two laughing lasses they had come to visit shared the none too wide couch of the other shieling with the two older women there. One of these was a matron with a motherly twinkle in her eye, the other was a spinster in whose eyes there shone a memorably vivid light; she was the sister (as I found later) of a noted minister on the mainland. The bare simplicity of shieling life is traditionally softened by fellowship and a gaiety that is not beyond control. A Lowland poet once coined a famous phrase,

33 (2) cliff-cut, where exposed stretches have been undermined by the Atlantic storms; and (3) sandy, where bays like Broad Bay have been filled in, or where shingle bars have enclosed a sheet of fresh water, as on the west coast (north-west of Stornoway) from Barvas southward to Dalebeg. The types of coast are illustrated by Plates II to V.

As to the sea floor—so important to fish-life and to navigation—the west coast of the Outer Hebrides borders a well-featured continental platform, which is higher in the north and south but lower in the middle. The irregularities suggest a former land-surface dissected by rivers with mature drainage systems.[1] The contours are revealing, as shown in the coloured map at the end, at intervals of 10 fathoms (60 feet). The sandy machar beaches of western South Harris, visible at low tide, form part of a wide, shallow shelf extending for a dozen miles off west South Harris to a depth of no more than 20 fathoms, and thence southwards along the machars of Uist to Barra; but the coast falls away steeply round most of Lewis and along the rocky east coast of 'the Long Island'.

5. *Glacial Drift or Boulder Clays, and Shell Sand*

Underlying the peat is the drift, which is spread over
33 all but the rockiest parts of the island. This is not only
14 exposed at every roadside cutting but is laid bare in wide areas around the villages. Here peat-cutting during the centuries has removed the peat, layer after layer, to the
56] topmost turf, left aside after cutting until the last. When
34] even this turf is removed for annual thatching, the bare

INTRODUCTION

131 The parish of Uig, Fig. 1, forms the south-west quadrant of Lewis; it falls naturally into three sections, each almost completely separated from the other by the salt waters of Loch Roag, Little Loch Roag and East Loch Roag.

• 133 South-west Uig is almost an island: only four miles separate the southern tip of Little Loch Roag and the head of Loch Resort which, penetrating deeply from the Atlantic, marks the boundary between Lewis and Harris. It is a mountainous area with fifteen miles of [491] exposed Atlantic coast between Loch Resort and Gallan Head. From the ultimate settlements, Brenish and Islivig, the main road (B 8011) takes a tortuous course of some 40 133 miles to Stornoway. Population is concentrated where soil and climatic conditions are 361 mitigated by the presence of machair (wind blown shell sand) and by the shelter afforded by the peninsulas of Aird Mhor Mangersta and Gallan Head. The chief settlements are thus around Uig Bay*, and on the western shores of Loch Roag. In addition each township has common pastures on the interior moors and mountains where shielings were maintained into the present century.

East of Little Loch Roag the road climbs over a moorland plateau at 250'-500' O.D.. More that 12 miles separates Enaclete, the last township on Little Loch Roag, from Garynahine, the first on East Loch Roag. The moor is uninhabited shooting and shieling ground; the population of this area is to be found to the north on Great Bernera, an island now connected by a bridge, and on the adjacent mainland shore.

Eastwards again the inland continuation of East Loch Roag is a great peat-filled depres- [491] sion which connects with Loch Leurbost on the east coast. This depression is skirted on its northern side by the main road, to Stornoway, A 858. The boundary between the parishes of Uig and Lochs cuts across this depression, which contains the only inland townships of Lewis - Loch Ganvich and Achmore. On the north-eastern shores of East Loch Roag is to be found more than half the population of the parish of Uig. The succession of densely populated townships from Garynahine to Carloway is much more typical of Lewis than are the more scattered and generally smaller, settlements of south Uig which are more like those of Harris, the Uists and Barra.

The sketch map, figure 1, shows the location and boundaries of the townships and other lands within the parish, and also the main roads. The reader will find it necessary, however, to make constant use of either Bartholomew's Half-Inch, or Ordnance Survey One-Inch to one mile, maps. In general topographic names are spelled in accordance with the latter.

CHAPTER I

THE PHYSICAL BACKGROUND

Lewisian Gneiss is ubiquitous, though often concealed by peat or, more rarely, by glacial drift. It is a grey foliated rock consisting of quartz, feldspar and ferro-magnesian minerals; the foliation varies from a vague alignment of the minerals to a strong banding of dark and light constituents. Minor variations in the mineral constituents give rise to lumps, lenticles and bands of basic and ultra-basic character; differential erosion may pick these out to form ridges and hillocks up to half-a-mile in extent. In the south-west occurs an area of foliated granite of Lewisian age, part of a larger complex which, cut by Loch Resort and West Loch Tarbert, extends into North and South Harris. At first sight the contrast between the mountainous south-west and the relatively plain central and northern parts of the parish might be attributed to the occurrence of this foliated granite but examination shows that this is by no means invariably the case. Indeed, the highest mountains of Harris are formed of gneiss, not granite; a similar plutonic intrusion north of East Loch Roag has only a slight physiographic manifestation.

The Lewisian is broken by a complicated network of lines of weakness; these are presumably faults, though their displacement can seldom be detected. Differential erosion, particularly by ice, has developed these bands, etching out a fantastic pattern of interlocking depressions, some filled by sea and fresh-water lochs, some by peat. These fall into two main groups: firstly an arcuate series dominated by the depression which runs from Loch Leurbost, by Loch Achmore and Loch Ganvich to the head of East Loch Roag and thence westwards by the straits of Bernera (Loch Barraglom), between Reef and Flodday, through Glen Valtos to Uig bay. Another member of this series is represented by Loch Ouirn, on the Minch coast, by the curious east-west head of Loch Seaforth, by the hollow occupied by the s-bend of Loch Langavat, by Loch Resort and Caolas Scarp. Secondly, a more numerous group of generally smaller depressions represents the etching out of lines of weakness which vary from north - south (in the west e.g. Uig bay - Loch Raonasgail - Loch Tamanavay, also Loch Suainaval) to N. N. W. - S. S. E. (in the centre and east, e.g. Little Loch Roag, East Loch Roag and numerous smaller depressions).

During the earlier and more extensive glaciations ice from the mainland must have pushed right across this part of Lewis. To this westward-moving ice must be attributed the differential erosion of the east-west depressions and, in all probability, the deposits of deeply weathered boulder clay found to the north-east of East Loch Roag. Later local glaciation has clearly affected the southern mountains. Here, as in North Harris, there is plentiful evidence of the retreat stages of a local ice cap or group of inter-connected mountain glaciers. Ice accumulation probably centred on the Morsgail Forest basin, between the south Uig mountains and those of North Harris; the northerly outflow of ice was responsible for the overdeepening of such valleys as Loch Suainaval, Loch Raonasgail, and Little Loch Roag. Extensive deposits of gravelly drift around Uig bay, and less extensive deposits near Valtos are the deposits of such glaciers. Their relatively recent age is attested by their fresh morphological character with numerous unsilted kettle lakes (despite the high rainfall of this region). Associated with them is the huge and spectacular Carnish kame-moraine, and the deep, steep-sided Valtos Glen. The former is a deposit of fluvioglacial water flowing from the south round the west side of Uig bay, the latter is the result of erosion by water flowing round the east of Uig bay to Loch Roag. One can only conclude that both features originated when Uig bay was occupied by a great mass of ice which must have blocked direct outflow to the sea.

153

Figure 3.

The diagram illustrates the essential contrast between Uig and the rest of Lewis. Uig has extensive uplands and mountains (26% above 400') whilst Lewis as a whole is characterised by low plateaux (21% below 400').

133 Over most of the parish the natural landscape is a series of low plateaux, generally below 250' O.D. around East Loch Roag, but rising westwards to an extensive platform with many summits around 500'-700'. Into this platform, towards its western edge, is incised the narrow trough containing Little Loch Roag. Above it rise the deeply dissected mountains of North Harris and south west Uig, with many precipitous slopes reaching to 1,500' or more and summits to 1,885'. The discontinuity between plateau and mountain is particularly well displayed along the Atlantic coast, where it corresponds roughly with the junction of granite and gneiss; an even more severe discontinuity, but formed entirely in gneiss; it is to be seen near the south end of Loch Langavat. Listhaid (1,611' O.D.) rises more than 1,400' in less than a mile. The mountains, although lacking height, are therefore spectacular in appearance. The low plateaux are far from featureless, too; their surfaces have been roughened and scraped bare by ice action and numerous hollows preserve shallow lochans and a few larger lakes. Occasional rocky hillocks rise 20'-100' above the plateaux; their abrupt discontinuity with the smooth surfaces is entirely comparable, though in miniature, with that of the mountains. They resemble nothing more than tropical inselberge and have no apparent structural explanation.

135 Unconsolidated superficial material, such as would provide sub-soil drainage and suitable raw material for soil formation, is rare. The characteristic surface almost everywhere is bare rock, often blanketed by peat at lower levels and on gentle slopes. Morainic material is most commonly preserved in hollows; peri-glacial conditions and, more recently, heavy rainfall have swept clear most of the higher and steeper places. In the east and north east, e.g. around Loch Carloway, a sticky grey clay with large boulders is sometimes seen; the coarse gravelly drifts of south Uig have already been mentioned. It is impossible to make any useful generalisations regarding the characteristics and distribution of the boulder clays because their occurrence is so sporadic and exposures, beneath the peat blanket, are rare. Very occasionally, e.g. in Bernera, a finely bedded 137 dull bluish or greenish grey clay is seen which is said to have been used for coarse pottery. This may be a lacustrine deposit of late glacial or early post glacial times or it might be a marine clay of the same period; there is however, no clear example of a raised beach in the area, which, were it present, might support the latter suggestion. 317 Since visit a lacustrine deposit of diatomite has been exploited on a small scale in Bernera.

Extensive deposits of fine white sand occur around Uig bay and in the Valtos-Kneep-Reef area; smaller deposits occur at Mangersta and Mealasta. Except at Cliff bay, Valtos, where it contains a high mineral content, the sand consists largely of finely broken shell debris. This blows readily and is found inland for half a mile or more and as high as 100' O.D., thus providing a natural surface dressing rich in lime. There are extensive machairs (sandy plains) at Kneep and Reef, and smaller ones at Uig bay, Mangersta, and Boeta (Berners). Little cultivation takes place on the machairs nowadays.

133 In the whole parish little soil, such as would be recognised by a lowland farmer, is to 134 be found. The most usual surface features are bare rock and blanket bog; arable land, hay 137 meadows and improved pastures are generally made on peat, gathered together into long 140 narrow beds - so-called "lazy beds" - separated by deep ditches. This expedient may 123 mean that the use of tractors is impossible; since horses have almost disappeared, 133 cultivation in such cases, if carried out at all, must now be by the spade alone. This is the traditional method of lazy-bed work; it may be very productive in terms of yield per 134 square yard but it is pathetically unproductive in terms of man-hours. In some areas it 141 is clear that it has led to soil erosion. Even where the size and lay-out of the beds permits tractor work the tractor probably spends as much time manoevering into position and turning, as it does ploughing. In a few places, e.g. some of the East Loch Roag

[TEXT CONTINUED ON PAGE 7]

133 townships and at Islivig and Brenish, the peat is thin (or has been stripped) to reveal a 134 gravelly drift. Free-draining on suitable slopes. In such places a black loamy soil has 134 been developed by cultivation; the many ditches of lazybed cultivation are not necessary 140 and, if the area is large enough, it can be worked by tractor. Such soils, in the climate 140 of west Lewis, are usually suitable for rotation grass, for hay or pasture, and much more could be done with them under knowledgeable management. Where shell sand has been blown inland on to peaty soils the natural top-dressing has had a remarkable 134 ameliorating effect on texture and acidity. Such areas are all too limited, the most 134 important are at Valtos, Kneep and Reef, and around Uig bay; smaller areas are at 124 Mealasta, Mangersta and Boeta (Berners). The hill grazings are dominated by a thin heather cover, blue moor grass and, in wetter places, sphagnum and cotton grass. Since the cattle population has been declining many older residents claim that the pastures, particularly near the townships, have deteriorated, the proportion of grass declining and coarse heather increasing. "The hills that were green when I was a boy", said one, "are now black". Neglected arable and pasture land, too, soon reverts. Rushes and flags invade the ditches between the old lazy beds and, if the ground is at all waterlogged, soon invade the beds as well. Drier ground, if not well grazed, soon reverts to heather. The limited machairs are little better; almost devoid of humus, they show little development of soil profile, only a thin grey layer of turf roots; rabbits, or injudicious cultivation readily set off wind erosion. Only where the wind has provided a natural blend of peat and machair are conditions better. Such areas are very limited.

132 The climate is in many respects severe; no local statistics are available, but some 133 for Stornoway and Benbecula are appended. The frequency of high winds has a baleful effect on both vegetation and stock, but to some extent wind counteracts excessive moisture. Near sea-level, where all the townships are situated, frost and snow are almost unknown. Thus it is exposure to the wind that limits the outwintering of stock, not low temperatures; this suggests that if pastures could be improved in suitably sheltered places far more advantage might be taken of the relatively mild winter temperatures. It is believed that 248 the sunshine received is particularly poor in the south, where clouds can frequently be seen hanging over the mountains when the sun is shining on Bernera and the area north 221 east of East Loch Roag. The relatively dry and sunny period which commonly occurs in May and June ought to yield a good hay harvest; unfortunately the natural meadows, such as they are, are late starters, and the custom is to cut the grass when it has gone to seed. Thus hay is often being taken in September - one of the wettest months in the year.

CHAPTER TWO

SOME HISTORICAL ASPECTS

172 Evidence of pre-historic and other early settlements in the parish is afforded by the occurence of standing stones, brochs and duns. The Callanish circle and its satellites are by far the most remarkable ancient monument in the Hebrides, and testify to the 174 former importance of the site even though today their precise significance may not be clear. Most of the duns are now little more than circular heaps of stones, but in that at 173 Dounc Carloway the double walls still stand to a considerable height. A later phase of 163 settlement is recorded in the place names, a very large proportion of which contain Norse 162 elements such as -nish, -vick, -bost and -shader; it seems probable that most of the present township sites have been more or less continuously occupied since Norse times.

1. [Presumably the author means "drift"--Analyst]

CHAPTER FOUR

THE ATLANTIC COAST

(Brenish, Islivig, and Mangersta)

by

Pamela M. Gough.

131 Brenish, Islivig and Mangersta are situated in the extreme south-west of Lewis, on the Atlantic coast of the parish of Uig and forty miles from Stornoway.

133 Brenish has a south-westerly aspect whilst Islivick faces north-west; in both the elevation of the crofts decreases seawards from about 125 ft. in the east to 50 - 25 ft. in the west. Only one croft in Islivig, and the eight most southerly crofts in Brenish, run to the sea - the rest obtain some shelter from a line of low hills about 300 yards wide and rising to a little over 100 feet, which forms their western boundary. The land terminates in low cliffs from 25' - 100' in height, and a rocky foreshore. Behind these townships to the east a range of mountains from 1,500' - 1,800' in height and dominated by the highest hill in Lewis, Mealisval, (1,885'), gives protection from easterly influences.

Mangersta lies to the north of these mountains; here the crofts lie in a sheltered 134 valley to the west of which the land rises to over 200 feet. The valley opens southwards to the sea where there is a sandy beach and machair. The crofts range from about 150 feet to 100 feet above sea level; those nearest the sea have soils which contain a substantial proportion of machair sand.

Soils are generally deep, and there are few rocky outcrops on the crofts which are fairly level. In Brenish and Islivig the soils are mainly peaty, becoming wetter in the west. Where visible the sub-soil is gravel or stony boulder clay. In Mangersta the transition from peaty soils on the northern crofts to sandy soils on the southern crofts, is marked by the increasingly continuous cultivation, drains being unnecessary on the latter.

137 There are no trees or shrubs, and vegetation consists of marshy grass moors in the Mealista area with a considerable amount of cotton grass bog further north. West and south of Mangersta the machair area is characterised by a calcole plant community similar in content to that found in many parts of the chalk and limestone areas of England.

361 Brenish and Islivig are old settlements, never cleared. In both, the sites of the 172 original clachans can still be seen clustered around the mouths of their respective streams. The houses are now situated at the east end of the crofts, near to the road.

175 To the south, Mealasta - cleared in the 1840's to make a sheep farm - was divided in 632 1921 to give enlargements to the common grazings of both Brenish and Mangersta. The 311 arable land was divided into twenty-nine shares as enlargements to Brenish crofts, and is held in a modified form of runrig.

Mangersta was cleared in 1837 to make a farm; subsequently fishermen-cottars settled on the farm but they moved to Dun Carloway in 1873. In 1910, however, a new township of thirteen crofts was set up by the Congested Districts Board; the new settlers were cottars, mainly from Brenish.

233 no road and access by foot is difficult. To reach the grazings the crofters travel by boat from Mealasta several times a year and stay in one of the two houses at Aird Sheag which, although vacant, is still in repair. These houses were formerly occupied by estate employees who had crofter status.

511 From the above account, it is evident that in this district as in others, a single croft is not sufficient to support a crofter and his family. On an average, each resident crofter has acquired the equivalent of two crofts, and in addition each crofter supplements the meagre income obtained from his croft by some other occupation, e.g. weaving, labouring, or driving.

CHAPTER FIVE

THE UIG BAY DISTRICT

(Carnish, Ardroil, Timsgarry and Crowlista)

by

Elizabeth Blowers.

134 Uig bay, in which low tide reveals several hundred acres of pure white sand, is surrounded by crofting townships. There are no extensive machair plains but the shell-sand forms a fringe of easily cultivated, lime-rich soils on all sides except Crowlista, and, blown inland by the Atlantic winds, it modifies and improves the texture and acidity of the 361 peaty soil as much as 2,000 yards from the shore. It is not to be wondered at that 175 this bay at one time formed one of the most important centres of population in Lewis. Signs of ancient cultivation, and the ruins of old clachans, are widespread, but most of the present settlements are less than forty years old; almost the whole area was cleared to make farms in the early nineteenth century. Only in Crowlista, with its thin, rocky, 121 arable land and almost complete absence of machair, were the small tenants left undisturbed. Consequently the district provides an opportunity to compare "old" and "new" townships, both as to lay-out and operation.

133 Carnish, in the south-west, is dominated by a huge gravel ridge - probably an esker, - 361 over a mile long and sloping steeply to the estuary of Amhuinn Chaslabhat with the rocky headland of Machair Carnish to the north. The arable land and houses of Ardroil are situated on the landward side of the hummocky machair land between the esturies of Amhuinn Chaslabhat and the Forea river which drains Loch a Suainaval and Stacsaigh. To the north of the bay the old settlement of Crowlista is situated on the rocky headland to the west of the Rethall embayment; there is a good deal of level land in the centre of the township but the slope to the estuary in the north is steep and rocky outcrops occur on the headland. Timsgarry, to the east of Rethall, stretches inland between the headlands of Tolenish and Borranish along the valley of the Eriesta river.

134 There is a mantle of gravelly drift over this area; the Carnish esker has been mentioned and exposures of up to 120' were also seen in gravel pits in Ardroil and Timsgarry. Along the coast blown shell sand rests on this drift and reaches inland for up to half a mile.

134 Alluvial soils have developed along the lower reaches of Amhuinn Thorabhair and the Eriesta river.

There are no trees apart from an occasional stunted rowan or willow - willows for 134 cattle shelter may grow still in some old garden enclosures. Hedges, too, are rare so, although 124 individual houses are often carefully sited, there is little cover and the townships as a whole are very exposed to westerly gales. The natural vegetation developed on the machair is of fine closely matted grasses with a good deal of natural clover - very similar to that found on chalk downland. On the peaty moorland the usual moor grasses mosses and heather are dominant, though little encroachment by bracken was noticed.

In Crowlista the strip layout of the crofts dates from a letting about 1850. (Figure 14) 311 In the new townships, laid out about 1921 (Figure 15) the majority of the crofts are 361 less strip-like and do not run to the shore. Indeed in Ardroil and Timsgarry only five 127 out of twenty-two reach the shore and the rocky headlands with their machair are valuable parts of the common pasture. The six crofts in Carnish run from the shore at the foot of the esker up its flank towards the southwest and almost to its summit. They also have one or two small plots each on the machair.

133 Crofts in Ardroil are in one piece. An old cattle road forms the north west boundary; from this they rise, steeply in places, to undulating moorland just over 200' high. Numbers 5 - 8 Timsgarry are strips across the Eriesta valley, rising northwards to just over 170'; 2, 3 and 4 are allotted to make use of arable land on the lower slopes of Knock Valabrie. The houses of crofts No. 1 Timsgarry and No. 1 Ardroil are the former farmhouses.

417 In Crowlista most of the crofts remain unfenced but in Carnish, Ardroil and Timsgarry all are fenced and many of the fences were being repaired or replaced in 1959. They are 134 not open for common grazing during the winter. Patches of sown hay are fenced within each croft.

There are six recognised croft-holdings in Carnish; one is sub-let so that there are 136 only five "operative" units; two of those are not worked. One has been resumed by the proprietors and is being quarried as an extension of the main quarry between the township dyke and main road. In Ardroil each of the fourteen crofts is worked as a unit - though two carry no stock; in Timsgarry eight crofts are worked as seven units.

In contrast to the above, the old settlement of Crowlista has twenty-five recognised crofts but, by amalgamation and sub-letting these are worked as fourteen units. The Crowlista crofts are small - fourteen are 4.0 acres or less and of those only one is worked as a unit. Crofts as small as 1.5 acres and with a score of eight sheep can never have been intended to support a family; they are the result of sub-division in earlier generations; the remains of two piers and a curing house point to the importance of 468 fishing in the past. Twenty-one men were employed in fishing boats about 1914. Subletting usually takes place between relatives; of some of the fourteen operative units are quite complicated. One example will suffice (croft numbers are here replaced by letters to prevent publication of personal matters):-

Crofts a, b, c and d are worked as a unit (although they are not adjacent). The tenant of a and b sub-lets c and d for grazing; he also helps with the work on yet a fifth croft. The present b is half of an original croft. West of the road the original croft is held in fixed runrig between b and another croft, not part of this multiple "working" unit; east of the road it has been divided into separate strips. The tenant lives on b.

484 As yet the tourist trade is almost entirely restricted to visiting relations but many
485 houses offer suitable accommodation for people who would appreciate quiet holidays in
these very beautiful surroundings. The distance from Stornoway, the difficulty of obtain-
486 ing varied food supplies - and the weather - were cited as disadvantages! Passengers on
a weekly coach tour from Stornoway are supplied with meals at an Ardroil house which has
good access to the beach but otherwise the crofters show little interest in the possibilities
of tourism.

162 In common with other crofting townships, the greatest problem here is that of an ageing
population because the younger people seek employment outside their township. The
166 diagrams illustrate the age-heavy structure of the permanent resident group and also the
464 numbers of the insurable population periodically or permanently away. The lack of suit-
able work for young women particularly, is also shown. The age of the tenants also
illustrates this problem. Of the thirty-seven tenants here, twenty or 34% are over sixty-
five. Serious, too, is the loss by emigration of people between fifteen and sixty-five. Of
the total 'working population', 35% have left this region since 1939. The corresponding
figure for Crowlista alone, the older settlement with smaller crofts, is as high as 42%.

241 We found in this part of Uig some crofts efficiently and energetically worked by young
239 tenants, and if reasonable stock prices are obtained the larger crofts can be worked
175 profitably. However no croft will fully support a family; ancillary employment is always
311 sought by crofters with growing families yet many crofts are carrying less stock than they
might because some tenants are not interested in, or able for, agriculture. The croft is
incorrectly thought of as a home, at part-time employment - often for older members of
the family - and as a place for retirement.

009 It is easy to list schemes for improvement and change:- dairying to supply Stornoway
with milk, poultry and pig keeping on a commercial scale, cultivation under glass, the
tourist industry, forestry on a small scale, lobster and crab fishing, etc. Such schemes
would require capital not available in the townships, careful planning, and tactful admini-
tration by people with real knowledge of this area and its people. Meanwhile even the
potential production of the crofts is by no means realised.

CHAPTER SIX

AIRD

by

Madge Phillips.

131 The little township of Aird is an isolated and old-established crofting settlement along
the western side of the narrow valley of the Ambuinn Gil no Ard-Aird, three miles
133 north of Crowlista. After leaving Loch Meacheit, the river flows northward through a
gorge (at the mouth of which are the ruins of the old corn-mill), then across a narrow
flood-plain into the rocky bay of Camus na h-Airde. The crofts, roughly fan-shaped in
421 arrangement and varying in size from 32 to 7 acres, each originally included a narrow
133 strip of the flood-plain, stretching across from just beyond the right bank of the river, up
the steep, rocky slope above the left bank and widening out over the more gently slopes
between the 150 ft. and 200 ft. contours. A number of the crofts were subsequently en-
larged, gaining extra land on the right bank of the stream, whilst others received additional
ground to the north or south.

1. [See figures 12 (facing p.34) and 17 (facing p.39)--Analyst]

133 The 1,700 acres of common pasture stretch to the east and west of the crofts, across
231 the peninsula which terminates in Gallan Head, extending to those of Crowlista and Valtos
in the south. The whole coast is broken and rocky, the land inland is peaty, and Aird
651 lacks the advantages of the machair land found further west. To the north of the village
there is now an R.A.F. radar station on Rudha Caol, built on what was part of the common
pasture. It dominates the landscape and makes a considerable difference to the life of the
inhabitants.

341 The township, though isolated, is reached by a good road which leaves the main road
at the western end of Glen Valtos. Grocery vans call on Wednesday and Friday, a
491 butcher's van on Saturday, and the local people are also allowed to shop at the N.A.A.F.I.
493 within the Camp. The road through the village approximately follows the line of the 100
ft. contour and all the houses are built directly on to the road, with byres, wearing sheds
and other buildings behind, whilst in most cases hens are kept on the steeper slopes below
235 the road. Thus the settlement has far more of the appearance of an English village than
342 have most crofting townships, but there is no shop or post office. The majority of the
houses are stone with slate roofs and fairly large, though some of them have been built for
359 more than fifty years. All have electric light and their own water supply and several have
127 modern byres.

427 There are ten crofts, as the enlargement of one of the original nine was subsequently
311 split off to make a separate croft. Of these, one tenant is an absentee and another an
447 sidesman who does no cultivation. In both these cases, grazing is let to others so
that there are actually eight operative units. The crofts are fenced in their upper portions,
but in most cases the fencing does not extend down to the river and there is free access to
the single concrete footbridge which spans the stream.

The only crops now grown are oats and potatoes and a few vegetables, with some sown
241 grass; natural grass provides most of the hay crop. Lime and shell sand and artificial
fertilisers are used; the two former particularly on the ground near the river where the
cultivation is in narrow strips separated by drainage ditches and ploughing is done by horse.
407 Most of the cultivated land is on the gentler slopes behind the houses, where the use of a
142 tractor is possible. Before 1914 most of the land within the original turf dyke was culti-
824 vated; here was grown and ground at the mill for meal for barley bread. Seaweed was
233 extensively used as a fertiliser and most of the families kept eight or nine cows, so that
there was a more plentiful supply of manure. Now, six of the families each keep one cow
for domestic milk supply (two of the others each keep a goat). The township possesses
no bull, but make use of those at Valtos or Ardroil.

253 On the other hand, the sheep sown is generally exceeded; instead of the entitlement
of about 200, the total flocks grazed on the township pastures are approximately 500. The
lambs are weaned early in August and put on Rudha Caol (Air Force use has not prevented
this) and wedders are usually sold at the age of two or three years in Stornoway - many
in October to reduce the numbers that must be pastured during the winter.

162 The total resident population of Aird consists of fifteen males and sixteen females.
Of these, twelve are over 65, six are aged 45 - 64, 11 are in the 15 - 44 age-group (there
are only three married couples) and there are two children under 15. Nevertheless, most
of them are complete families; only one person lives alone; no members are reported as
166 periodically working away, no men and only two women are permanently away. Neither
has there been much emigration since 1939 - five women only have married out of the
parish. The tenants of seven of the crofts are over the age of 65, the only one in the 15 -
44 age-group is a new-comer to the district and does little croft work.

591 It is obvious that crofting no longer affords a livelihood in Aird; the only two families
146 without ancillary occupations are those where all the members are elderly. Of the others
280 with members in the working age-groups, five have one or more members employed in a
civilian capacity at the R.A.F. station and there are five regular weavers.

62 Aird used to be a self-contained community; the land was fully cultivated and a certain
173 amount of fishing was carried on in spite of the difficulty of drawing a boat over the
rocky beach. Now it is prosperous, but very much dependent on the R.A.F. station, and
if this should ever close down, most of the younger people would have to leave in search of
other employment.

CHAPTER SEVEN

VALTOS, KNEEP AND REEF

by

David G. Symes.

131 On the eastern side of the Aird peninsula, facing east to Loch Roag is a secondary
133 peninsula of more moderate, but none-the-less broken relief. This, together with an
adjacent area of the main peninsula, the islands of Pabay, Vacsay, Vuia Mor and several
smaller islands, comprises the territorial limits of the townships of Valtos, Kneep and
Reef.

138 This secondary peninsula is accidented in the extreme, with outcrops of bare rock and
steeply angled small hills. The relief is greater in the west (summit 450') than in the
east (summit 275'). Relatively level land is to be found only on the machairs of Reef and
133 Cliff (the latter only poorly developed) and on the glebe at Uigean. The Reef machair,
134 about 180 acres in extent, consists of a succession landwards of tidal sands, a belt of sand dunes
(c. 20' O.D.) and a sandy plain sloping gently inland towards a reed filled lagoon. The
machair at Cliff is approximately 40 acres in extent; here there are fixed dunes and, in
addition, the sand has been blown inland to at least 100 ft. O.D. Except where the machair
sand has drifted upslope to produce a "brown machair" of mixed sand and peat, the thin
soils of the Valtos peninsula are predominantly peaty. Although the length of the peninsula faces north the extremes of Atlantic weather are moderated by the protection afforded by the Aird peninsula and the islands of Pabay and Vacsay.

175 In the period before the letting of crofts the whole peninsula was occupied by some five
424 clachans - Valtos, Cliff, Kneep, Uigean and Reef - some of which shared common pastures.
134 During the early part of the nineteenth century and earlier, apparently, than the 1850 letting
133 carried out in most of Lewis, crofts were allotted in each of the clachan areas: Valtos and
Cliff shared a common pasture and so became one township; similarly Kneep and Uigean were combined.

175 In Kneep it seems that the croft boundaries were not accepted by the crofters. Certain
311 basic divisions between groups of crofts (usually three in number) are discernable today,
427 and within these basic divisions a certain regularity of distribution of strips persists, but

432 strips running across the slope, which are interchanged each year, whilst a large part of
427 the common grazing lands are divided into interchangeable sections ("quarters") to
accommodate each of the groups of crofts. See Figures 22 and 23.

133 The cultivable crofland at Kneep is relatively flat and the natural drainage is poorly
developed; the quality of this land, depends to a very great extent on the upkeep of a dyke
133 running across the crofland from a small marshy loch to the sea. That dyke has not been
512 cleaned for several years, and as a result a large area has been invaded by reeds. Other
parts of the crofland have been similarly overrun by 'wild rhubarb'. Such deterioration is almost inevitable when land is so fragmented.

The crofts at Reef are grouped in three separate localities. Crofts 1, 2 and 3, on the edge of the machair have probably never been occupied since the crofts were alloted in 1921 and are now used only for grazing. The main body of the crofts (nos. 3 - 13) face south - they are more compact than those in Valtos and Reef, but they vary in size from 2.9 to 13.25 acres and their boundaries are irregular in shape. Two crofts (14 and 15) are separated from the main parts of Reef: they are both small (2.5 acres) but the size is compensated by their situation on the level terrain of the machair. The old farm house
241 is used as the dwelling for both 14 and 15. Much of the cultivation at Reef, except on the
401 machair crofts, is on lazy beds - but many of these have decayed with the advent of horse and tractor ploughing: 35% of the land is cultivated by spade, and the remainder by horse plough.

433 The crofting economy is probably at its lowest ebb in Reef. Only eight of the fifteen
728 crofts are occupied and of these five are worked by disabled crofters or crofters over sixty-five. The Reef crofts were settled in 1921 by returning ex-servicemen and today seven are being worked by the original settlers; there is little evidence of a desire among the younger generation to succeed to the crofts.

233 Until 1956, crofters on Reef used to graze both sheep and young cattle on the Flannan Islands, fifteen miles west of Uig.

162 Fig. 24 shows the age/sex structure of the population in the three townships. It tells a story familiar to crofting townships: 55% of the resident population are over forty-five years of age; 9% of the total population are permanently away; and since 1939 the population has declined by at least 15% as the result of emigration alone. But perhaps the
165 most significant fact is the very small proportion of women of a child-bearing age and the consequence that only three children are being born each year to replace the older generations.

131 By their very position, the townships of the Valtos peninsula are isolated. Fifty years
20 ago communication with the rest of Lewis was by boat. The road to Valtos and Kneep was built originally to bring the mails from the pier at Meavaig; the motor road to Reef was completed in 1956. Shopping facilities are provided at Valtos, for the people at
493 Valtos and Kneep, and at Meavaig which serves Reef, Uigean and Cliff. These are
supplemented by travelling shops which call once per week, by Indian dealers and by the
local 'bus-driver who makes purchases in Stornoway on behalf of customers on the
346 peninsula. The school for the whole area is situated mid-way between Cliff and Valtos and two kirks and the doctor's house lie at the junction of the Valtos and Reef roads.

CHAPTER EIGHT

LITTLE LOCH ROAG DISTRICT

(Meavaig, Caryshader, Ungshader, Geshader, Enaclete and Gisla).

by

Annie Heawood.

133 Little Loch Roag is a narrow sea loch extending southwards about twelve miles inland
173 from Loch Roag proper. It has been formed by glacial erosion picking out one of the
194 n.n.e. to s.s.w. lines of weakness characteristic of the Lewisian gneiss. Although generally steep-sided, recent glaciation left much ground moraine and this material, best preserved on the less steep slopes, provides arable land for several small townships on or near its western shores. The eastern shore is the more rugged and although a few small townships once existed there is now only the small farm and shooting lodge of Scalascro. At the head of the loch is an estate cottage for Morsgail Lodge which is a large mansion with extensive fishing and shooting rights, grandly isolated about a mile inland from the main road.

361 The district here described includes Gisla, near the head of Little Loch Roag, Enaclete
134 Ungshader, and Geshader, on the western shores of Loch Roag proper. All these are
strung out on or close to the main road. Meavaig, like Gisla, is a small farm but also
365 functions as something of a metropolis for south Uig: it has the post-master, whose other functions include registrar and receiver of wrecks it has two churches, a telephone exchange, the district doctor and manse, and a petrol pump. At the time of our visit it was also the base for the 'bus service. Its metropolitan functions arose in the days before the road replaced a ferry boat service from Callanish; here the mails were landed until some date in the 1920s, and here, too, the estate kept coach and horses for transport to Uig lodge, three miles further west.

361 There is no record of the original settlement of the four crofting townships, nor of
365 Gisla, which was a township (or 'joint farm') of five crofters until about 1850. Some
modern houses and bungalows have been built, many with easier access to the road than
134 the old black houses, now often used as byres. Water supply does not seem to present a serious problem because of the extensive moorland gathering grounds to the west, but there are not at present any water-supply schemes. Electricity is, of course, available. Caryshader and Enaclete are on the main Stornoway road being served at present by the 'bus and by vans selling meat, groceries and fish at least once a week. Enaclete has a sub-post-office. Geshader is less fortunate since, although vans call regularly, 'buses must be met at the junction of the unsurfaced track and the main Stornoway road, where the school serving this district also stands. The track has been extended to Ungshader so that it now reaches all the houses. Ungshader, however, is smaller and although it has had similar delivery arrangements, it is now a dying settlement largely due to its inaccessibility.

427 The crofts are mostly regular in shape on the landward side and fenced except where
the land is very broken as in northern Enaclete. In Caryshader there are fourteen legal
632 crofts which at present are worked as eleven units; one is used only as a holiday home
311 by its owner-occupier and there is one squatter on the common grazing. In Geshader there are eleven crofts, each worked independantly; Ungshader has four crofts but the

CHAPTER TEN

EAST LOCH ROAG DISTRICT

(Garynahine, Callanish, Breasclete, and Tolsta Chaolis)

GARYNAHINE by Anne Iredale and Jennifer Oxenbury.

131 632 133 Garynahine is a townships of twelve crofts which are situated on the eastern arm of Loch Ceann Thulabhig. The crofts nowhere extend more than one-third of a mile from the coast. There is a hinterland of about 1,800 acres of common grazing, which is mostly about 100 ft above sea-level, though it rises to 200 ft in a few isolated areas; the crofts are lower, and maximum elevation is 80 ft.

134 Most of the croft land is drained by the stream Allt Mhurchaidh which flows through all but two of the crofts. But the soils are heavy, and several crofters cut peat on their crofts. Many crofters complained that their land was too peaty for cultivation.

361 The crofts form a regular pattern beside the south side of the main road from Stornoway to Breasclete, with two small feus and a 21 acre freeholding on the north side of the road. In addition there is a farm (Garynahine Lodge) of 400 acres east of the crofts, and likewise stretching along the south side of the Stornoway road. The main road to Uig passes through the farm, dividing the cultivated area in the west from the grazing section.

195 361 241 311 The regular lay-out of the crofts dates from the formation of the township in 1935. On the same site, but long cleared, there had been an older village about the same size i.e. twelve crofts, known to be in existence in the 1850's. The crofts were in a similar position, but were a different shape, and the ruins of some of the croft houses still remain. This village was completely burnt out one gusty winter evening when, it is said, a spark from a crofter's pipe was blown onto one of the thatched roofs, and the wind quickly spread the blaze to consume the entire village. The crofters left the area, many going to the neighbouring township of Callanish; Garynahine then became one large farm until 1935 when the land was re-allocated into crofts. The new crofters came from a variety of areas, several coming from Crulivig, others from Breasclete and Callanish. The owners of the farm had also opened an hotel which prospered until 1945 when the farm was sold to its present owner Admiral Drummond, who has since used the house of a private house. Nine acres of the farm land is cultivated, and the remaining 391 acres are used for grazing. In contrast to the usual practice in this area the oats have been undersown with rye grass. Another beneficial innovation at the farm is the introduction of shelter belts. Trees have been successfully planted, making it possible to produce good crops of soft fruits such as raspberries, strawberries etc. Both the crops and the stock on the farm are of a high standard, showing that with capital and correct management the land can be remarkably productive.

In contrast to the large scale economy of the farm, the twelve crofts (ten operative units) are each between 4.6 and 6.2 acres, and the total reputed arable is 67.3 acres. In all there are only 9.5 acres under crop (oats 6 acres and potatoes 3.5 acres), and 2.25 acres under sown grass. The crofts are worked either by spade, horse (hire from croft 40 Callanish) or by tractor (hire from the Lodge). The seasonal rhythm of cultivation and of stock rearing is that in Callanish.

Enquiries soon reveal that crofting is not the main occupation of the croft tenants. Another indication of the declining interest in the land is the fencing of the crofts. All were fenced when they were formed in 1935; since then there has been no refencing. Now a grant is available to pay 75% of the cost of re-fencing but little has been done.

231 Stock totals (see Appendix C) have declined recently and this trend will probably continue. There are only four cows and two calves in the township (plus six at the farm).

231 There is no bull in Garynahine; the Department of Agriculture bull from Callanish is borrowed. Most crofters buy their milk either from the Admiral at the Lodge or from Stornoway whence a dairy delivers daily.

233 Eight crofters keep sheep; stocks vary between 5 and 30 per holding. Two crofters exceed their souming (there is no equivalence in Garynahine because there has always been plenty of pasture). With a total of only 166 sheep and lambs on 1800 acres common pasture there is no danger of over-grazing.

312 399 491 The village has a good piped water supply from Loch Mhurchaidh, and has had electricity since 1954. There are excellent communications: 4 buses a day to Stornoway and also one bus from Uig and one from Bernera passing through Garynahine. These good communications have probably contributed to the declining interest in crofting.

463 [178] There are only three full-time crofters (two of whom draw war pensions). Of the remaining 12 adult men permanently resident, 10 have regular or part time work, the remaining two being to old. Employment is either in Stornoway or at the Lodge. Only two people do part time weaving. Crofting is rapidly decaying in Garynahine. The croft land is reverting to rough grazing, and there is no indication of renewed interest in the land. Instead, life is becoming increasingly orientated towards Stornoway.

CALLANISH by Anne Iredale and Jennifer Oxenbury

172 133 [361] Callanish must be one of the original settlement sites of the Hebrides, as it boasts an impressive standing stone circle and two other groups of stones. The stone circle is on a promontory, which projects into East Loch Roag. The promontory rises to about 125 ft, and then the land drops almost to sea-level at the neck (less than half a mile wide) which joins the promontory to the mainland. The township extends inland for about six miles in a belt roughly two miles wide. This inland area forms the common grazing; it is rough hummocky moorland with the general height rising gradually inland; the highest point is 425 ft.

195 427 34 241 The early crofts were situated close to the stone circle overlooking the Loch. The area was given to crofters who had been cleared from Linshader in the eighteenth century, and it is said that until the Crofter's Act the Callanish crofters had to return to Linshader to work for one day a year in return for this grant of land. But later the crofts on the more exposed westward facing side of the promontory were cleared and replaced by the 90 acre Callanish Farm. Some ruins of the croft houses still remain. The crofts then spread across the low lying neck to the main road from Stornoway to Breasclete, which now forms the boundary between the croftland and the common pasture. The croftland varies in quality, but it is mainly quite good potential arable. Fertilizer and manure are extensively used. Seaweed was widely used in the past but in more recent years the labour of gathering the seaweed has been out-balanced by the lower price of the artificial fertiliser. The main problem of the crofters is one of drainage, and in some parts the drainage channels have to be as wide as the strips of cultivation. Croft 29, situated on a small peninsula from the neck of low lying land, is almost cut off from the mainland at high tide.

175 361 427 The croft houses were then in two nuclei; one on each side of the narrow neck. Much later a third nuclei developed, known as Callanish New Park, further north along the Stornoway road, formed by evicted crofters from Bernera; they had put to sea in small boats with their belongings, and they happened to land at this point. They first became squatters on the common grazing but later gained crofter status.

427 311 There are 47 crofts in Callanish which vary in size from 2 acres to 9.7 acres. Some of the larger crofts are a result of private enterprise; the crofters have, without any

[TEXT CONTINUED ON PAGE 89]

312 [Map] [359] There is no piped water supply and after even a short period water shortage. Only a few crofts are decaying, and there is a tendenc to the more agriculturally inclined crofters instead of allowing t addition to the full-time crofters, 31 other men do part-time cro weave and this provides their main income, but this figure fluctu prosperity of the Harris Tweed industry; at present the figure i average. Although 32 people have emigrated from the township [166] young people who have married on the mainland), there are still [164] young families making their homes here. The dominant age-gr [162] dent adults is 15 to 44. Total population is steadily declining, been a prosperous area and seems likely to remain among the m communities.

BREASCLETE PARK by Margaret Grice and Doreen

195 427 Breasclete Park, also known as New Park, Callanish, was from Reef in the mid 19th century. Two of the six original crof making nine. However, there are only five working units and o vation. There is also a feu house built in 1958.

361 241 231 The crofts, which are fenced, form broad strips perpendicul Callanish road. Cultivation is mainly by tractor, oats, potatoes grown. One progressive crofter has successfully experimente acre of grazing land on his own croft. Common pasture for the is shared with Callanish, and for most purposes the Park can be that township.

162 The total population is 26 of which 4 are permanently away. 65, and 8 children under 15.

BREASCLETE by Margaret Grice and Doreen J.

131 133 Breasclete is situated on the east side of East Loch Roag on from the seashore to the moorland and is interrupted by rocky o northern part. It is separated from the township of Callanish t westerly flowing stream, at the mouth of which is the site of a n

491 361 [Map] The road on which most of the houses are situated, (follows a middle of the crofts, but newer houses and some feus have been Callanish-Cartoway road, nearer to the shore. Stornoway is 1 road which is turned throughout. Breasclete could be served b Pentland Road, were it to be properly surfaced and this would m by 4 miles. Two buses in each direction per day connect the to high fares make visits to the town infrequent.

Since 1939,
166 54 people have emigrated whereas only 4 have immigrated. Most of the girls have to
462 leave home when they finish school as there is no employment locally. Many of them go into domestic service or nursing in Glasgow. Many of the younger men also spend time away from home, often in the Merchant Navy. Breasclete is also the temporary home of the families of lighthousemen on duty in the Flannan Isles.

288 Although the people live and work on the croft, weaving the Harris Tweed provides the main source of income. This is a rather irregular occupation owing to the uncertain demand for the tweed, and although the men are nominally self-employed they rely on the mills to supply them with work. The tweed is woven on treadle looms, which, with ancillary equipment such as bobbin winders, are all owned by the crofters.

[458] As 1959 was a good year for the tweed industry, there was an air of prosperity in the township, and with the aid of government housing grants many new bungalows were being erected. But should there be a slump, the crofts would be unable to support the population and most of the bread-winners will have to leave.

TOLSTA CHAOLAIS by Roger H. Thomas.

131 The township of Tolsta Chaolais lies in a shallow glaciated depression occupied by Loch
133 a' Bhaile and Loch Shader. Most of the crofts are situated near the shore of these lochs,
361 for westwards to the sea the terrain is too rocky and irregular for either settlement or cultivation, whilst to the east of Loch a' Bhaile the land slopes precipitously from 250 ft. to the loch shore. As Figure 36 shows settlement takes advantage of the more gentle drift-covered slopes, generally of small extent.

137 Cultivation is very noticeably limited to three areas - along the west shore of Loch
[241] a' Bhaile, along the north-east shore of Loch Shader, and in the valley of the small stream draining from the north into the head of Loch a' Bhaile. Most of the croft land is composed of rock outcrops, rarely exceeding 100 ft. in height, separated by damp depressions frequently filled by reeds and rushes; bracken was apparent only on three crofts. In particular, the area between the two lochs is badly in need of draining and is largely colonised by reeds and very coarse grasses, of no use whatsoever as pasture. One enterprising person suggested that the township should hire a ditching machine - this could certainly be put to use with great advantage.

632 The settlement comprises 43 registered crofts, 6 feus, 2 squatters, 1 cottar, and
311 2 holiday bungalows, with the croft holdings aligned north-east/south-west between the two lochs and the sea, except for nos. 28 and 29. The 53 holdings are unofficially
427 amalgamated in various ways and so reduced to 35 operative agricultural units. The acreage of crofts varies from 2.2 to 20.75 acres - a considerable variation. Fencing of the crofts - except for 1A, B, and C, and 12A, B, and C which are held 'run-rig' - was carried out between 1945 and 1950, whilst in 1946 the common pasture of 2,700 acres was fenced into two parks - an inner and an outer one, the division coinciding with the Carloway to Breasclete road. An area stretching from crofts 18A to 21 has, however, been most haphazardly divided. The seaward halves of some five crofts were redivided amongst seventeen crofts in the southern half of the township to compensate them for lack of grazing area within their own croft boundaries. This division is said to date from about 1886.

241 Most of the cultivation is carried out with hired tractor, although two crofts owned
[167] small mechanical cultivators. Ploughing by tractor and horse, as opposed to spade cultivation, depends either on the urgency of the operation, or on the accessibility of the plot, for any small patches of cultivation on the rougher terrain are dug by spade, as

CHAPTER ELEVEN

THE CARLOWAY DISTRICT

by

Brian Loughbrough

The seven crofting townships of Upper Carloway, (including Carloway Park), Borrowston, Garenin, Knock Carloway, Dun Carloway and Kirivick form a compact area of land in the north of the Parish of Uig bordering the coast and Loch Carloway. Here the Lewisian gneiss has a thin discontinuous covering of glacial drift which is most extensively developed immediately above the head of Loch Carloway. Three valleys help to determine the layout of the townships and settlements (figure 37). The townships to the north-west of the Carloway river are found on more gentle slopes than those to the south east where the slopes are less uniform and are less uniform and are often broken by short steep rocky faces. The north western area therefore offers an environment where almost continuous cultivation is possible whereas in the south east the frequent rock outcrops have led to fragmented cultivation on minute plots which are inaccessible to the tractor or other mechanised implements.

The soils are heavy and acid even on the skinned land of the boulder clay slopes nor is there any machair to mitigate the acidity of the peaty areas which descend almost to the shores. Only in one place is there any trace of the influence of the sand and this is to be found where the crofts numbered 1 to 3 Garenin border the small bay in the north of that township. Here the fierce gales have blown some of the finer beach deposits on to the croft land.

Much of the peat has been cut from the inner common pastures except in the case of Upper Carloway where active cutting is still taking place in the valley whose flanks are occupied by squatter settlements, to the east of the football pitch. On the common pasture the vegetation varies from peat moss and heather with bracken to fescue and close turf on the skinned land by the road to Dalemore. On the upper common pasture heather and bracken have increased since the abandonment of the shielings and the reduction of the cattle stock; many inhabitants remember that the hills once had a much greener aspect. Nor is this a feature confined to the common pastures; on one croft in Upper Carloway 1.9 acres are completely covered by heather whilst a neighbouring croft has a good crop of oats on similar land. At the loch in both Knock and Upper Carloway areas of former arable land have reverted to moss, the old lazy beds being picked out by lines of reeds.

Settlement. The settlement pattern is one of great interest for it shows in a clear way the effects of the distrinct phases in the historical geography of the area. The evidence of success and failure stands side by side. Before attempting to justify this assertion it is necessary to give a brief account of the physical evolution and distribution of settlement.

The origin of permanent settlement is believed * to have been the permanent occupation of shielings used by people from Bernera until the eighteenth century. Until about 1850 arable land was held run-rig and the houses were huddled together in tight little clusters. When individual crofts were lotted, about 1850, the houses werescattered, each on its croft and generally up to fifty yards from the present road (which was then no more than a rough track). Sea access was then most important but since the advent of modern road transport new houses have been built nearer to the roads, producing the modern markedly linear plan. The roads extend at different heights across the slopes

* based on information supplied by Mr Macleod of 27 Garenin.

[NEXT CONTINUED ON PAGE 101]

ground. Some of these provide for a much larger area and indeed the policeman serves the whole of the parish of Uig. Three buses per day in each direction operating on a circular route provide transport to Stornoway.

UPPER CARLOWAY

The township comprises 51 registered crofts and 28 feus and allotments which are situated on the drift covered slope which rises from the head of Loch Carloway. The crofts are each about half a mile in length and from 5 to 25 yards in width aligned up and downslope. The lowest portion of the croftland is just above sea level and the highest approaches 225 feet O.D. The key crofts are numbers 30 and 31 whose boundaries come to a point thus enabling the crofts to be accommodated on the arcuate hill face. In the east are the crofts of Park Carloway which were lotted at a later date than the main area of croftland (numbers 1 to 40).

Only two crofts are fragmented ('fixed runrig'), these occupy lowlying hummocky land near the river where fencing would be difficult. Elsewhere fencing has been almost completed between the roads, but above the upper road fencing is less common, usually only being undertaken by the more enterprising crofters with more promising land; the bare rock surface of crofts 9 and 10 precludes any such attempt there. Almost all the fencing has taken place since 1946.

The 51 crofts and 28 feus and allotments are operated in 56 working agricultural units. The total land reputed arable 134.4 acres and the outrun 82.65 acres which gives a total of 217.05 acres of individually held ('croft') land. The method of working is controlled by the relationship of slope, soil and elevation. Three zones may be distinguished, namely

(1) Below the road;
  a) well drained and fairly accessible,
  b) poorly drained and often far from the croft house
(2) Between the roads; a main zone of cultivation
(3) Above the main road an upper zone
  a) with bare rock and thin soil
  b) drift covered - similar in character to (2), but more exposed

Crofts 1 - 32 occupy all three zones
" 33 - 40 and 46 occupy zones (2) and (3)
" 49 is in zone (2)
" 41 and 42 are in zone (1)a and are in 'fixed runrig'.

In nearly all parts of these zones it is possible to use a tractor and so the cultivation of oats and cutting of hay is accomplished. It is usual to work the potatoes by horse, but only one man preferred to do all his ploughing by horse. This widespread use of the tractor is in marked contrast to the townships southeast of the Loch where it is almost impossible to use the tractor in many places. The significance of this in the contrasts in methods and efficiency need hardly be emphasised.

Life in a crofting township is governed by a very distinctive pattern of working that is so strong that it even influences the operations of the mills in Stornoway, for each crofter, if he continues to work his croft fully, must take time off for the communal operations such as the shearing or dipping of the sheep and inevitably at certain times of the year he will be anxious to work the croft. The table attempts to set out the pattern of the agricultural year in this group of townships (Figure 40).

361 the main area of cultivation at the head of Loch Carloway, is similarly divided into long
427 narrow crofts which traverse the broad valley which falls to the sea from the low water-shed marking the boundaries of Upper Carloway, Borroston and Garenin. The settlement is to be found on either side of the road which rises from the bay to join the two major township roads of Upper Carloway.

181 The township has a very individual character, especially at the seaward end which is
427 exposed to violent winds and spray in the winter and where the dwellings are mostly black houses. Tenanted by old ladies two of these are partly sublet and the future seems to suggest that a complete subletting will take place, which contrasts with the activity of many of the other crofters in the township. One man was prepared to carry all the fertiliser for the croft on his back because it was impossible to gain access for the tractor.

427 The twenty eight crofts, one feu and one allotment are worked in twenty five units.
311 Extensive improvements have been made on two crofts with the introduction of sown grasses in their rotations. A general increase in fencing is now taking place with the consequent closure of the crofts which were formerly open for common grazing in the winter. By far the most striking feature in the figures gathered for the township are those for the sheep stock. Although the total souming for all stock is not quite reached, the sheep soum is exceeded by 60.3%. This does not worry the crofters one of whom spoke of a 'natural souming' pointing to the fact that the total souming was not exceeded and he continued that 'if the land is overstocked animals die'; this they do all too frequently. The assertion seems to be based on the belief that the equivalence of one cow equals three or even five sheep gives an accurate assessment of the potential of the grazing. The evidence of the heavy sheep losses does not bear this out. That sheep eat a different herbage and in a different manner to cattle seems to be either unknown or is ignored.

The whole agricultural operation of the township is complicated by its situation; long journeys were necessary to go to the shielings and are still needed for bringing home the
[286] peats. Once again the emphasis is on weaving as an occupation and many of these people
161 are ageing. It is a measure of the decline in the population that now only fifteen children
[162] go to school whereas one crofter could remember up to fifty in the school before the First War.

The main features which emerge from this examination of the townships to the north west of Loch Carloway may be summed up quite briefly. The croftland is a compact area of well cultivated land on the even slopes which rise to over 200 ft. O.D. It is divided into long narrow holdings which ensures that each has a fair share of the different types of land. Careful attention to much of the land shows that this is far from being a
000 dying community. In spite of the defects which can be noted in the animal husbandry, the decreased population and the reduced number of working units (a result of the sub-letting) could allow of a much more efficient working than does take place at the present time. The potential is there. Carloway has many of the basic social services which help to stabilise a community and with the advantage of its strategic position the concentration of settlement could be assured if additional employment and/or more efficient agricultural methods could be adopted.

KNOCK CARLOWAY

● 133 If the north west presents a picture of relative prosperity the area to the south may be described as one that is showing signs of decay and decline. Knock Carloway itself
[181] occupies part of the area with less evenly graded slopes (although a westerly outlier of the township extends to the northern flank of Loch Carloway). The eastern section rises steeply to a rocky crest which marks the beginning of the common pasture. In
361 consequence the crofts are less regular than those already described and three are
[427] worked in 'fixed runrig' with a pattern of much more fragmented cultivation. Situated on the lowest shoulder of the ridge are the churches and school close to the road junction

[TEXT CONTINUED ON PAGE 109]

361 at Carloway Bridge. In addition to the main settlement which is irregularly disposed on either side of the two roads, a group of Swedish timber Council houses has been built in a somewhat forbidding situation on the common pasture adjoining the 'Pentland' road.

427 The thirty three registered crofts and thirteen feus or allotments (of which only five
311 are non-agricultural) are worked in thirty four units. Three of the tenants of the Swedish houses have crofts, two in Knock Carloway and one in Upper Carloway.

311 The land use figures show that Knock Carloway has a much greater percentage of permanent grass than has Borroweston on the opposite shore of the loch. These figures reflect not only the less rewarding physical environment on the south shore, but also the lower intensity of cultivation which bears a direct relationship to the type, number and quality of the stock. The township has less than the total number of animals permitted by the souming though the higher figure for sheep than cattle reflects the general trend for the area. No horses are kept but the township has the bull which serves the area - a privately owned beef-shorthorn.

464 Weaving remains the major occupation but the emphasis is less heavy than in the other
[286] townships for the community services centred here employ a number of the inhabitants.
[632] it may be that here lies part of the answer to the problems of the community as a whole: but even if employment in services were to be increased it could never be very significant in a district with a total population of only 600.

KIRIVICK

361 Adjoining Knock Carloway is the small township of Kirivick which has forty one per-
[162] manent residents. It occupies the least rewarding agricultural environment of the area. Crofts 1 to 13 rise from the shore of Loch Carloway on the broken hill face to the Carloway-
● [133] Breaaclete road, whilst number 14 occupies the head of a small valley which was once part of the common pasture beyond the road.

361 The houses are set back from the road occasionally sheltering in the lee of the frequent
133 knolls of bare rock which are exposed on the croft land. These rock surfaces together with the irregular deposition of the drift account for the fragmentation of the cultivated strips in small hand-dug lazy beds on the upper parts of the crofts inaccessible to the tractor.

361 There are fourteen crofts, three feus and one squatter settlement and all but two of
427 these are fenced. Two of the crofts are held in 'fixed runrig' and the small sections in
311 which the land is cultivated are shown in figure 41 which also illustrates the regular distribution of sections between the two. Though it used to be the normal practice the crofts are not now open to common grazing in the winter.

311 The restricted amount of land available for common grazing ensured the continued use of the shielings until 1939; small patches were cultivated on the common grazing about forty years ago and this fact too is the only recorded instance of a practice that was a community by the size of the working unit and the land available. At the moment there is no proposal for reseeding of any part of the common pasture* because of the difficulty of getting access for tractors. As in the case of Knock Carloway the total souming is not exceeded, but the sheep stock is 25% above the sheep soum.

162 The population figures emphasise the problem of the whole of this southern area and here is the most extreme case of incipient decline. There are two fulltime crofters, six crofters who weave and five crofters over sixty five. Seventy per cent of the population is over 45 and only two children attend the school neither of which is likely to take up crofting.

1. [Figure 42--Analyst]

[Seaforthhead]

161 Table XVII reinforces the idea that there is a striking dichotomy between the agricultural
162 and fishing townships. The former are characterised by a more stable population trend,
166 significantly fewer of the population in permanent employment forth of Park, and a smaller loss by
167 migration. In the fishing townships, where growth and decline have been equally meteoric,
241 there is a larger proportion of persons in permanent employment furth of Park, and migration
222 losses have been greater. It is also significant that there is a smaller natural increase of
632 0.5 per cent in the agricultural townships. The only township which shows a natural decrease over this period is Calbost, one of the fishing townships.

SEAFORTHEAD AND SHIELDERNISH

Rachel A. Hirst

131 Seaforthhead and Shieldernish are separated by 4,485 acres of rough grazing, the former lying on the northern shore of Loch Seaforth and the latter on the southern shore of Loch Erisort.

SEAFORTHEAD

135 Seaforthhead, the most isolated of all the Park townships, consists of three crofts and a
361 gamekeeper's holding. The township boundary is situated between the 50 and 75 foot contours which at their furthest extent are only 150 yards from the shore. Immediately behind the road the land rises very steeply in rough uncultivable moorland covered with many boulders but generally below the road the land slopes gently at about 5-10 degrees, in places being
[247] completely flat. Here, however, the lazy-beds are very boggy and rushes have appeared in the ten years since cultivation ceased.

134 The soils are deep near the shore due to soil creep; higher up they are very thin and peat
137 accumulates to at least 3 feet both below and above the road. There is little cover; bracken is rare, but silverweed and heather, moorland sedges and grasses soon colonise disused lazy-beds.

241 Legally there are three crofts but only one is still cropped, the other two being used solely
[255] for grazing. There is, however, a gamekeeper's holding within the township boundary worked as a croft. The other two crofts are used as ancillary grazings to holdings in Airidhvruach and Balallan and have not been lived on for forty years and ten years respectively.

[244] The chief crops are oats and potatoes, though the gamekeeper had a patch of turnips and
the other croft had grown them during the last few years until 'finger and toe' developed.
[407] Patches, about half an acre in extent, are drained with stone drains and ploughed by tractor, after which potatoes are grown to clean the soil, followed by oats for one year and then sown hay
[314] for three to four years. This is not strictly adhered to and several lazy-beds appeared to be in natural hay. There is no peat-cutting on the crofts as peat is secured just outside the
[251] township fence on the common pasture. Lambing has been poor for the past two years being only 50 per cent in 1958; the stock carried is twice the sheep sown. The cattle, Highland and Ayrshire or Shorthorn crosses, are below the sown, but previously nine cows and followers have been kept.

161 There has been a great decrease in population and cultivation since the resettlement in
162 1886. In Seaforthhead and Shieldernish as a whole, there were twelve crofters before the
241
178

[Seaforthhead] [Shieldernish] [Habost]

161 suppression of the original townships opposed to six today. As a result, many lazy-beds, now
162 given over to natural grass, are being gradually encroached on by heather and juncus. Out
of the present population of twenty-three, one is permanently away and two have migrated
241 since 1939. There is a more healthy population structure, with a large number of males
178 between 15 and 44, due to a large family having returned home and six children, five of school age.

361 In Seaforthhead and Shieldernish all settlement is below the road and house-sites are on
[609] slight elevations. At Seaforthhead is the reputed hunting lodge of the Seaforth's, 'Seaforth Castle',
505 now ruined, but still showing signs of abnormal size and arrangement. When first settled,
[491] communication was by ferry (1820). Now a cart-track, deeply rutted, to Eisken Lodge gives
178 access to the Tarbert-Stornoway road two-and-a-half miles away.

SHIELDERNISH

131 Shieldernish, also consisting of three crofts, is better situated on the Park and South Loche
361 road. The three houses are situated on a well-drained northerly slope, half-way between the
632 road and the shore, but the three crofts are on better land and greater accessibility has led to better management and new ideas.

241 Cultivation in isolated patches reaches up to nearly 100 feet and the lazy-beds have been put
311 together to permit ploughing by horse or tractor. One croft grows neither oats nor potatoes, preferring to enclose two one-acre parks, re-seed them, cut the hay in June, and wean the
[246] lambs on the aftermath. By next year, this crofter hopes to have enclosed and re-seeded a
237 further acre and will then use the three in rotation. The other two crofts grow both oats and
244 potatoes and one is also sowing down. The crofts average fourteen acres in size but although gentle slopes are extensive, the major part of the crofts is in permanent pasture. The total
[226] stocking of the Shieldernish crofts is below the souming. Fishing is now only for domestic use
[288] though there is a small jetty on No. 1. Part-time weaving is performed on two of the six crofts.

The future pattern would appear to progress to more grazing and less cultivation. Two out of the six crofts - both at Seaforthhead - are worked from outside the township and this isolated township, being difficult of access and having little cultivable land, is better suited to grazing. Shieldernish appears more suitable for enclosing parks for fattening lambs, as soils are deeper and slopes gentler, making the use of a tractor feasible. More could be got out of the crofts especially with fertilising and re-seeding for hay and pasture and growing
[325] fodder crops for wintering. It is hoped to fence the common securely, and then stock will be renewed - a great necessity. Daily communication with Stornoway also means that Shieldernish is better placed than Seaforthhead for a flourishing settlement. The crofts are certainly of a workable size - provided part-time work, such as weaving, is maintained, along with the grants from the Crofter's Commission.

HABOST

Rachel A Hirst

131 Habost is scattered around a small bay on the south shore of Loch Erisort. Settlement
135 stretches for over a mile encroaching on three small hills separated by wide, well-drained
241 valleys which soon rise to the dominating Craigeal (225 feet). Slopes are varied but tend to
361 flatten out at about 100 feet near the road and on this flat, most of the cultivation takes place.
[134] Nearer the shore, slopes are much steeper and on the hills there are bare rock faces and thin soils.

[Habost] [Kershader]

464 Of the 53 residents, 19 are over 65 and only 5 under 15 years, leaving a working population
161 of 29: seven are in permanent employment elsewhere. The population has been steadily
162 declining since its peak of 121 in 1901.
166
167

Since 1946, the township has changed considerably. It has been completely fenced and the
178 method of cultivation has changed from spade and horse-plough to tractor and cultivators. A
241 further fence has been erected for a lamb park and much land has been re-seeded; an increase
281 area has been put down to hay. It would seem that fattening of stock for market is intended, an
[407] better attention is being paid to stock. Yet the population is ageing and there are few young men
[162] to take the place of the older crofters; when working units become larger and stock decreases a figure nearer the real carrying capacity of the grazing, the croft could become a profitable concern: at the moment, the croft is only maintained through grants and ancillary earnings. Should that happen, however, there must be more re-seeding and an increase of cultivation to provide winter fodder.

KERSHADER

Philip W. Wheeler, M.A.

131 Kershader is a township of forty-three permanent residents on thirteen crofts, which stretc
161 for a mile along the southern shore of Loch Erisort. The crofts extend up to one-third of a
162 mile from the coast with a two-and-a-half mile deep hinterland of common grazing. The extre
135 elevation is 270 feet and the average from 125 feet to 175 feet, but the crofts, mostly arranged
361 in rectangular strips at right angles to the coast, are lower (maximum 125 feet) and include three main zones (Fig. 8):

241
154
361

(a) From the low cliffs of the shore to the road, approximately, a zone mainly below 50 fe dissected by four rejuvenated valleys. The soils of the greater part of this zone have distinctive profile and tend to be moderately heavy, wet, and unsuited to fertilisation b seaware. The smaller hillocks in this zone have thinner soils of the same sort, but th main hill (crofts 10/11) is an extension of zone (c).

(b) A zone between 50 feet and 75 feet with hills rising to over 100 feet. The lower areas have varied soils, easily fertilised, and intermediate in type between those of (a) and (b), with peaty-loam characteristics, overlying aquifermus gravels. The higher areas have thinner soils of the same kind with poor grassy pasture; in places there are signs of former skinning.

(c) A zone of hollows with deep moss soils requiring intensive drainage and reacting well to heavy fertilisation with seaware and intervening heights covered with blanket bog, partly skinned, heather and grass. This zone passes into the common grazing.

Crofts 10, 11 and 12, irregular in disposition, have a steep coast line with gentler slopes over 50 feet; crofts 2 to 8, steep slopes in parts of zone (b), and crofts 1 and 9, again of irregular shape, are intermediate (Fig. 5).

241 In Kershader, there are thirteen legal crofts and twelve operative units. The crofts vary be
311 ween 4.4 and 18 acres, with a maximum of 3 acres reputed arable. In all, there are 23.45 acr reputed arable and 110.35 acres outrun. 24.5 acres are in fact under crop (oats 18.5, potatoes 6.0), and 9.5 acres under sown grass; and of the remaining 99.8 acres, mainly natural grass

[Kershader] [Garyvard]

132 common grazings - at present approximately correctly stocked - and cannot therefore provide
241 much employment. Hence it is the standard of agriculture that must be improved. Since the
[213] land does not permit striking extension or improvement of the cultivated area, development
must be directed towards improving pasture, with more re-seeding and controlled grazing
900 similar to that already described. All this, however, is of little avail if prices for cattle, sheep and wool remain low, or at least lower than prices prevailing on the mainland. The first priority, therefore, in the establishment of a prosperous agriculture is a guaranteed market-price. Given this, it might become worthwhile to take steps to increase the carrying capacity of the crofts. It may be assumed that this would involve an all-round improvement which could give a firm basis to the economic existence of the community; until this is achieved, stability and continuity are out of the question.

GARYVARD

Gwenyth R. Page, B. A.

131 The landscape of the south-east coast of Loch Erisort is a sombre and rugged one. The
133 Quaternary ice sheets left in their wake troughs now filled by the sea loch, innumerable lochs covered in water lilies, a massive area of indeterminate drainage and expanses of bare gneiss.

Garyvard is set on the fringe of this landscape on a 20 to 25° slope with the crofts aligned
[551] from the moor to the sea, on a mantle of drift. Here is the home of the MacLeods, the Mackinnons
121 and the Montgomerys. Life beats out its regular pattern of existence during the winter months
351 on the croft, followed by an increasing tempo and variety of work during the rest of the year. In January and February the animals must be fed on hay or lose the battle to survive. In February
241 there are preparations for the year's tasks, making repairs and improvements to the croft. Next month will find the crofter on the land, making or clearing drains and putting fences and dykes in order. The tempo of life quickens with the year; April sees the first sheep dipping, the land turned over, potatoes and oats sown. From mid-May, the sheep leave the crofts to fend
[347] for themselves on the common grazing. The following three or four months are times of tremendous activity on the moors when the peats are cut, to be stacked later, first in fours, then in eights, so that the wind may dry them, till eventually bee-hive-shaped stacks - some four feet high - can be seen near the peat banks in August. Then begins the wearisome task of carrying the peats home, all too frequently in creels carried on the back, since the peat workings of Garyvard are on the moors up to half a mile from road. Altogether some two miles of roads are needed to prevent the villagers patronising the coal merchants of Stornoway. Two crofters, however, cut peat on their crofts, whilst others have permission to cut from Cromore or Caversta common grazings close to the road. All the while croft work continues, varying from hoeing, weeding and cutting hay to the gathering of sheep for shearing. As there are no fences between the various commons, crofters must travel from one township fank to another, seeking their own. In August the lambs are weaned. Hay making generally ends in August and is immediately followed by the oat harvest in September. By the time both oats and hay have been gathered in, the potatoes are lifted and the sheep are brought in from the common grazing about October 12th. The last sheep dipping takes place in November and is followed by tupping.

241 There are eleven crofts altogether, though one is divided, each portion having a legal tenant
423 who has a half share in the common grazing. Two crofts are 12 acres in extent, the half crofts 2.75 acres only, though the acre cultivated on the common grazing by one of the latter crofters since 1923, has recently been officially recognised. Most crofts are in strips running from the sea-shore up the slope some 500 yards to the township dyke, and are clearly demarcated by fences erected just after the last war. Three crofts have additional strips whilst one croft was
[175] an extra strip belonging to another croft. The additional strips date back about 100 years to a time when the township grew rapidly as a result of evictions in southern Park. One croft is divided and worked in three separate parts so in effect there are fourteen operative units in Garyvard.

[Garyvard] [Caversta]

532 At the moment Garyvard appears to be a go-ahead village, carrying out communal schemes
[162] which will benefit the township as a whole. However, the age structure of the population is abnormal since 60 per cent of the population is over 45 years. The future in Garyvard offers young people
192 hard work, little money and no entertainment, making the attractions of the cities and industries of the mainland quite irresistible. Unless some industry can be started the future bodes ill for the area, since most crofters are of the opinion that a weekly wage packet would more than compensate
191 the loss of their independence. Perhaps it is symptomatic of the age of National Assistance and subsidies that man cares more for momentary rewards and the luxuries of life. This is well understood by parents who encourage their children to leave the islands to seek employment either in Britain or within the Commonwealth. The Lewisman is no sentimentalist clinging to dying traditions and a way of life. His present desires have been re-cast as a result of his increasing contact with the world beyond the Hebrides and he is prepared to abandon his home where it defeats his aims and purpose. Unless prosperity can be brought in by way of industry, tourism or increased croft efficiency, possibly through co-operation in working and marketing, it is possible that we are witnessing the end of a community.

CAVERSTA

Helen Mackenzie

131 Caversta lies along a southern inlet of Loch Erisort, five miles from the Minch and is partially sheltered from east winds by the Cromore peninsula and Eilean Chaluim Chille.

133 The physical nature of the terrain is irregular, rising steeply from the water's edge to a level
361 of approximately 225 feet. To the west and to the east, the land slopes to the river estuary and it is here that the settlement occurs. Particularly in the north-west, two marked breaks in slope are visible at 75 feet and 100 feet above the loch, which is here bordered by a 25 foot rock face. The resulting platforms are separated by faces of bare rock. The valley of the Caversta River is a noteworthy feature. Below a small loch, the river follows an irregular course though a wide and shallow moraine-strewn depression and a quarter-of-a-mile from its estuary, has cut through some low hills rising about 30 feet above the depression. At this point, its course becomes steeper as it passes through a small gorge, which is probably an overflow channel.

137 Trees are non-existent and the natural vegetation consists of Sphagnum on the peat bogs in the hollows and grasses and sedges on the gentler slopes. The steeper, less waterlogged slopes, often broken by rocky bluffs, have heather cover; bracken growth is kept in check by heavy grazing.
134 Forty-six acres of land have been reclaimed by clearing heather and removing peat to form the
411 crofts, but the soil, which varies in depth from a few inches to a few feet, is very acid.

The six legal crofts vary in acreage from 4.75 to 8.5 acres and a squatter has 5.5 acres of
129 enclosed land. The township is in two parts: Torista, with the two smallest crofts, lies at the east-
241 ern extremity, while the other five holdings, also bounded by a dyke, border Tob Caversta, an
632 inlet of Loch Erisort. The crofts, which run from the shore to the township dyke, were set prior
[175] to 1861; originally the township formed part of Crobeg Farm. The legal units are, in fact, operative units except that one of the Torista crofts, now unoccupied, is used for wintering lambs by the absentee's brother, a resident of Caversta.

342 There are no occupied black houses remaining in either Torista or Caversta, as during the past fifty years new dwellings have been erected in dressed stone or corrugated iron, usually with roofs of asbestos slate, tarred felt, or corrugated iron. Several old thatched houses are now used as barns and byres.

[Cromore] [Marivig]

366 butchers' vans call on Wednesday and Friday and a fish van once or twice during the week. Goods
494 are also conveyed by the daily bus. Electricity was brought to the village about four years ago
377 and the inhabitants now look forward to a supply of piped water in about two years' time. At present
[312] only three or four houses have bathrooms.

The crofts, when worked well, are good enough to provide the existing population with a satis-
241 factory subsistence, but each family unit must have some additional source of income. It seems
430 that the recent subsidies for fishing are good enough to attract fishermen from Cromore and one or
228 two boats might be sent out from the bay if the quay were longer. Weaving has brought prosperity
288 but, as the Park Association states in its Second Progress Report "there is not sufficient weaving available for the present number of weavers". The proposal to establish a spinning and processing plant in the Park District made in the 1957 Report, would undoubtedly be of great value to the
900 people of Cromore. The village is sited in a most picturesque spot and one of the inhabitants suggested that a hotel built on Crobeg Farm would bring some benefit to the community. However, even if these three increased sources of income became effective, one wonders whether they would be sufficient to attract the younger generation, already urbanised by schooldays spent in Stornoway.

MARIVIG

Pamela Gough, B. A.

131 Marivig is situated on the western and south-eastern sides of Loch Marivig, a small triangular sea loch opening to the north-east and sheltered from storms and swells by Torray Island, making the loch an ideal anchorage and harbour.

133 The land rises steeply from the shore of the loch for twenty-five feet to fifty feet, then slopes more gradually and irregularly, with frequent precipitous rock outcrops, for two hundred to five hundred yards to rise steeply to a line of low hills, two hundred and fifty feet to three hundred feet high, surrounding the loch. All crofts thus have an easterly or north-easterly aspect, not particularly favourable for agriculture, and only one has any appreciable area of level land
134 uninterrupted by rock outcrops. Soils, derived from glacial drift, are unevenly distributed, thin, and very stony, and cultivable areas are thus small and widely dispersed.

137 The surrounding hills, which form part of the eight hundred and sixty-three acres of common grazing, are mainly covered with heather, moor grass or sphagnum bog, while the lower areas within the township are grassy, but drainage is poor, and rushes are widespread. Bracken is not yet a problem, and only small areas exist, mainly on the lower slopes of the western side of the loch. A few rowans and willows survive here also, but otherwise the area is devoid of cover.

There are twenty-four registered crofts in Marivig, twenty-two being inhabited, one vacant
241 and worked by another crofter, and one worked from a house on the common. With the exception
632 of two crofts, one of which is on the common, all the boundaries run from the township dyke, which closely follows the two hundred foot contour, to the sea in radial fashion (Fig. 4). The size of the crofts varies from 1.25 acres to 22.25 acres but only seven crofts and less than four or more than eight acres in size. No croft has more than three acres of land which has ever been cultivated, and few now cultivate more than one acre. There are thirteen cottars and squatters, five houses being on the common, three of them cultivating small areas adjacent to their houses.

241 Cultivation is exclusively by spade on the 'lazy-bed' system. Owing to the rocky nature of the
[240] terrain, the 'lazy-beds' are narrow, often only one or two yards wide. Potatoes and oats are
246 grown in rotation, and hay taken from lazy beds left fallow. Very few crofters sow grass for hay
237 or undersow their crops. Dung and seaweed are used as fertilisers, with potato fertiliser as the
[824] most general 'artificial'. Small enclosed gardens, often somewhat neglected, produce lettuce, carrots, cabbage and soft fruits on about half the crofts, but no garden produce is marketed.

[Mariviig] [Calbost]

900 In conclusion, it may be said that the problem of Mariviig's future, and that of other crofting townships, is not only one of adverse aspect, soil and weather conditions, and of distance from markets, but a problem of the population finding a stable and viable level where agricultural units are large enough to encourage the active and enterprising section of the population to remain, and a problem of finding capital to equip a modern fishing fleet.

CALBOST

Anne Cooper

131 Calbost is situated five miles to the north-east of Gravir on the Minch coast of Park. It occupies
135 a basin-like hollow in the centre of which is Loch Dubh, and is open to the sea on the east. The
362 croft houses are scattered over a shelf 50 feet above sea-level round the sides of the hollow and along the valleys which enter the township to the north and south-west.

194 The cultivable soil, a mixture of peat and well-drained gravelly drift, is on the higher ground.
197 Although here the rock outcrops in many places. On land formerly cultivated, bracken is spreading rapidly and now covers a large proportion of the surface, although twenty to thirty years ago it was unknown. Heather dominates the common pasture and rushes are widespread in the low-lying central area. There are a few willows and rowans round the old buildings, probably planted as wind-breaks.

195 Calbost was originally a single farm but the township was formed about 1820. The pattern of
196 the croft differs from the usual shore-to-dyke alignment, as six crofts were allotted extra land
in the valley which enters from the north, when a part of the common grazing was brought within
the township dyke. There are now fourteen crofts of which four are worked by resident crofters
and ten by squatters. The remainder are used only for hay and grazing and are sub-let to crofters
in Calbost and other townships.

Cultivation is entirely by spade and of the 2.6 acres now in cultivation, potatoes account for
2.37 acres. The small acreage of oats reflects the greatly reduced cattle stock of only two cows and
two calves. Approximately twelve acres of hay are cut as winter feed for the 225 sheep which graze
in the township.

The hay-beds in natural hay and the outrun are being rapidly encroached on by bracken. The
prevalence of bracken, and the amount of work needed to clear it, is likely to deter any attempt at
renewed cultivation.

Calbost was originally a fishing township in spite of its harbour being so exposed: boats have to
be taken up on the shore instead of being moored in the bay. The decline of the fishing industry whic
has prevailed in Lewis has contributed towards the almost complete desertion of Calbost, leaving
only a few boats now used only for leisure purposes. Croft income is supplemented by only two of
the men in the township, one a weaver and the other in the Merchant Navy. Although there are a few
productive gardens, no attempt is made to market any produce.

The township dyke is very close to the settlement and in the past shielings were not so widely use
in Calbost as elsewhere. The cattle were instead brought near to the dyke for milking and allowed
to graze on the common unattended. There are ruins of shielings to be found on the hills around
Calbost but a more interesting feature is the second dyke; enclosures were made adjoining the main
dyke and in the late summer the cattle were brought to fresh pasture within these dykes before
the opening of the township gates. Following the opening of the gates the stock are free to wander
over all crofts but there seems today to be a move towards the complete enclosure of the crofts.

[Calbost] [Gravir] [Glengravir]

161 The present situation in Calbost is best illustrated by reference to the population statistics.
162 There are only 17 people living there at present, seven of whom are squatters and only eight houses are occupied within the dyke. Of the male population, there are three children under fourteen years, one man in the 15-44 age group, three between 45 and 64 years and two over 65. This clearly shows the lack of active men from 15-44 years, necessary for the continuing economic success of
164 the community. However, even these figures are not so striking as the numbers of emigrants as
165 no less than 159 men and 40 women have left Calbost since 1939.

A community of 120 persons has shrunk to less than 20 in only twenty years as the younger
166 people have left to find employment in Stornoway and on the mainland. The present population
163 structure seems to indicate a continuation of the downward trend.

GRAVIR AND GLENGRAVIR

194 Gravir, the largest Park township numerically in population and crofts, lies astride the major
198 east-west inlet of Loch Ouirn, a glacially modified line of structural weakness. The site of the township is perhaps the most picturesque in all Park, but the steep slopes, lack of cover, the small area of good arable land, and the considerable population existing on slim resources, problems common to Park as a whole, are all epitomised in Gravir.

167 On the south-facing slope above the loch and the continuation of the trough in the valley to the
west, the majority of the houses have been carved from moor to sea, some before 1800, and some
the process of the abolition of run-rig which was accomplished in the years 1850 to 1852.
195 Originally, there appears to have been thirty crofts, but four were added during the nineteenth century, two at each end of the line, and in 1934 a further fifteen were cut out of the common grazing, a mile to the west of Gravir. On the south side of the loch, the 'clachan' of Tom an Fhuadain, established about 1800, has since developed into a further nine crofts. Thus there are forty-three legal crofts in Gravir and a further fifteen in Glengravir making fifty-eight in all.

The layout of Glengravir, a line of crofts from 3.6 to five acres, typifies the small post-1918 Department of Agriculture holdings. The arrangement of the Gravir crofts is illustrated in Figure 7, and it will be seen that not all the crofts are consolidated. There are three areas of former arable commons which have been lotted in unfenced strips and they may well be reclamations which were necessary to supplement the food producing capacity of the holdings. The method of division and allocation speaks of a period when a subsistence economy under severe pressure from over-population necessitated fair shares for all. The last of these commons was in cultivation until 1891. Although subsistence crofting has been obsolete since then, there is as yet no move towards a regularisation of the layout.

176 The congestion which necessitated the reclamation of the arable commons developed mainly
as a result of a successful drive to raise a population which prospered from four acres of 'old arable'. In the
128 were two curing stations in Gravir. With relative prosperity from an ancillary industry, cottars
were tolerated and the population rose from 197 in 1839, to 368 in 1881 reaching a peak of 468
162 in 1911. The collapse of the industry after 1914 began the downward trend which has certainly not yet ceased. Gravir reverted from 1918 to a township of agriculturalists and a base for employment forth of Lewis, although there have been spasms of successful fishing activity since.

241 Stock raising is now the function of the township and the agricultural resources and conditions
are hardly conducive to the development of economic holdings. The Gravir and Glengravir crofts
vary between 3.5 and 26.5 acres in size; a township which prospered from four acres of 'old arable'. In the days of subsistence agriculture, and indeed until the 1930's, cultivation, all in narrow lazy-beds, banked up with stones at the downward extremity on the steep slopes, was much more extensive. All the cultivable land was at one time under crop, heavily manured with seaweed cut as far away as
123 Cromore or the coast south of Kebock Head. About one-third of the maximum lazy-bed area is now cropped and the more inaccessible areas of the crofts have reverted to pasture; some of the lazy-

[Gravir] [Glengravir] [Lemreuvy]

The urgent need in Gravir is a reduction in the number of holdings. A pre-requisite of such
reorganisation would be the creation of employment for a non-crofting population. Weaving and
fishing are the more obvious occupations; the former is subject to world trade fluctuations but the
latter is now in a more favourable position since the introduction of the herring fishing guaranteed
subsidy, although the raising of the initial capital for buying and equipping boats is a formidable
problem. It is clear that a division of the community into a crofting and non-crofting sector is
essential if the present population level is to be maintained. The most serious aspect of the present
trend is that the migrating section of the community comprises the younger and more enterprising
people. Unless holdings of economic size can be formed, and stable employment introduced, one can
expect the younger men and women to remain in Gravir.

Until a major reorganisation of the crofts is carried out, a vigorous attempt to re-seed large
areas of the common pasture and the three former arable commons, and the development of a croft-
tourist industry, are interim possibilities. It is not sufficiently realised in crofting districts that
there is a demand from the city dweller for simple accommodation and good plain fare in a clean
atmosphere, with the possibility of hill walking and fishing on fresh and salt water. Yet, until the
proposed water-scheme becomes a reality, tourism on a moderate scale can hardly be contemplated.

One can only conclude that until reorganisation takes place and transforms Gravir into a township
of viable agricultural holdings, any stabilisation of the present trends is out of the question. A
decline in the number of holdings is inevitable in the long run but a planned reduction over a number
of years would bring about a more viable community than the disintegration which will occur without
such planning. Until this is achieved, the young men and women have little incentive to remain in
Gravir.

LEMREWAY

Beth Blowers, Brenda G. Turner
and John E. Wearmouth

151 Lemreway, the southernmost township of Park, comprises 290 acres arable and outrun divided
249 into thirty-three crofts and 3,925 acres of common pasture. The township is situated on the north-
side of Loch Shell round a bay in the shelter of Eilean Iuvard.

The township consists of three distinct areas. A flat, poorly drained area at about 100 feet, part
193 common pasture and part reclaimed as extensions to the crofts, locally known as 'the Outend', forms
the first subdivision. The second area, further west, is of a hummocky nature. To the east, a steep
slope rises to an altitude of 400 feet, less than half a mile from the loch shore, forming the third.
Two benches are to be seen at about 100 feet on the steeper slope and similar, though wider terraces
occur at the same height to the north. It is suggested that the flat area is the bed of a moraine-
dammed lake, and that the hummocky sector is partly morainic and partly ice-eroded rock exposure.
A channel eroded through this sector allowed the lake to drain southwards leaving a relatively deeply
incised valley through which the present stream flows to the sea.

Soils may be divided into two types - a peaty loam and the better drained gravelly loam which is
194 found to the east and along the main stream; the latter is particularly suitable for potato cultivation.

197 Except on rocky outcrops, the very steep slopes and the drained areas, blanket bog predominates.
Sphagnum here is rarely dominant but where the land is badly drained Deer's hair grass (Scirpus
cespitosus) and cotton grass (Eriophorum vaginatum and Eriophorum angustifolium) are the
dominants. On slightly drier land, purple moor grass (Molinia caerulea) and mat grass (nardus
stricta) are abundant. Other dominants are bog asphodel (Narthecium ossifragum) and cross-leaved
heather (Erica tetralix) with other common species such as the sundews (Drosera rotundifolia and
intermedia), butterwort (Pinguicula vulgaris), Juncus sp., Carex sp. and Carex panicea occurring
sporadically. Where the peat has been cut and drained, 'heather moor' usually develops and Calluna

[Orinsay]

261 which rises steeply, exceeding 375 feet in the west and 150 feet to the north and east. From
the north-west and north-east two glacially deepened valleys drain southwards, their lower ends
192 being "drowned" by northward extensions of the loch.

194 Although peat covers most of the surface it is only in the hollows that it is significantly deep,
for even on the gentler slopes the peat cover is frequently so thin as to expose a layer of morainic sub-soil containing many stones and boulders.

197 Two rowans and a dozen willows represent the only tree growth, but tree stumps frequently
exposed in peat-cuttings suggest that woodland was formerly more evident. Whether this former
woodland disappeared as a result of human action or of climatic change it is not possible to say, but
it is certain that a century of overgrazing has not favoured natural regeneration. Moorland grasses,
sedges and a little poor heather characterise much of the area, and reflect the poor grazing
capacity of much of the moorland. Bracken has established itself in one limited area on a patch
of neglected croft land.

195 Orinsay is unique in Park, for the present township is entirely a twentieth century development.
63 In the early 19th century there was a settlement at the head of the loch, but in 1843 the residents were removed and the area enclosed and added to Crobeg sheep farm. In 1916, there was a proposal to establish fourteen crofts, but the applicants were requested to wait until after the war. At the end of the war the return of many young men with a desire to settle down led to serious overcrowding in Lemreway. Several of them 'raided' the Orinsay area. At first living in huts, they built their own houses, and in 1922 the Department of Agriculture intervened, recognising and formalising off fourteen legal crofts, and at the same time providing a good footpath. Seeing the success of their neighbours, four other Lemreway families, comprising 26 people, went to Stiemreway, about a mile to the west of Orinsay. Here, however, the Department of Agriculture did not intervene and with the community remaining isolated, most of the settlers returned to Lemreway within three years, although one family remained until 1929.

Six of the crofts have an area of less than ten acres, six have between ten and fifteen acres,
while the remaining two occupy eighteen and twenty-five acres: the largest croft originally belonged
to the shepherd on the sheep farm. Three of these crofts are not occupied, although worked by
other crofters, with the result that eleven operative units share 161 acres.

Only a small part of the croft acreage is actually cultivable; even less is cultivated in practice.
251 The broken and rocky terrain combined with the peaty soil allows nothing but the cultivation by spade
of tiny lazy-beds. The total area now cultivated does not exceed 25 acres, although in the past it may have been nearer 40 acres.

Oats and potatoes are the staple crops, occupying 9 and 6½ acres respectively in 1958. Individual
246 croft acreages of these crops vary in relation to the requirements for winter stock-feed, and in the
244 case of potatoes, to domestic consumption. Nevertheless to produce even these meagre returns
the soil requires careful preparation. A plentiful supply of seaweed is obtained from the shore and is the most frequently used fertiliser, while a little sulphate of ammonia is applied. Only two crofters use lime.

293 In the last two decades a marked reduction in the number of oats grown has accompanied a
decrease in the numbers of cattle and an increasing use of hay for fodder. Nevertheless only about
172 acres of hay altogether are cut, and only five of the crofters sow any grass seed.

251 In August 1958, the township supported only 13 cows, 3 young beasts and 8 calves. Half of the
crofters have a cow and a calf, but there have been no cattle at all, and one even used condensed milk.
A sad commentary on the state of crofting in Orinsay, but a phenomenonby no means uncommon in crofting areas.

124 a wider applicability of my thesis. The evidence in support of
120 my assertion was collected on the culture history of the Isle of Skye, a part of the area known as the Highlands and Islands of Scotland.

101 Since I shall frequently speak of the Highlands and Islands in the following pages, we should have a precise definition of the
123 region (Figure 1). Geographically, the Highland boundary should be placed at the Great Highland Fault, a series of geological faults which extend across Scotland from the River Clyde to Stonehaven, south of Aberdeen. Politically and economically,
121 however, this line has receded to the north and west. Since 188[illegible] it has been common in Scotland to equate the Highlands and Islands with the "Seven Crofting Counties," those counties in which the
124 predominate form of land use is the crofting system. Crofting may be defined as a system of hereditary tenure of a few acres of arable land combined with common tenure of hill grazings.
124 These counties are: Argyll, Inverness, Ross and Cromarty,
125 Caithness, Sutherland, Orkney, and Zetland. Out of the 163 parishes in these counties only 12 are considered non-crofting.[1]
126 In addition to this shared socio-economic pattern, the seven counties have experienced common economic-geographical influences a century of accelerating population growth, followed by a century of persistent depopulation.

---

[1] Adam Collier, The Crofting Problem: A Social and Economic Study (Cambridge: Cambridge University Press, 1953), p. 11n. A parish in Scotland is an ecclesiastical district which until 1929 was also a civil unit with self-government in such local affairs as education, relief for the poor and infirm, and health. If the British county is thought of as analogous to an American state, the parish can be thought of as a county, but one devoid of any function.

CHAPTER II

A FIRST IMPRESSION OF SKYE

131 133 Scotland includes among her distinctive characteristics the possession and jurisdiction of more islands, 787, than any other nation in Europe. Stretching along Scotland's west coast for 200 miles in an inner and outer archipelago, the Hebrides account for over 500 of these islands. The Isle of Skye is the largest of the Inner Hebrides. Reference to the map (Figure 2) will show that Skye is forty-nine miles long and from three to twenty-two wide. The coastline measures 184 350 miles. The total area is 643 square miles. Although less than a mile separates Skye from the mainland at Kyle Akin and Kyle Rhea, the inhabitants are enisled geographically by the sea and culturally by the peripheral position of the Island to the main stream of British society and culture.

The isolation of Skye is due to two basic facts. The topography of the Highland region, with its scenic valleys, cut by sea lochs and flanked by precipitous mountains, has created natural barriers to communication with the cities of Lowland 48 Scotland and England. The second fact is that the transportation 131 133 facilities of the Western Highlands have never been integrated with Great Britain's main communication system. The problem, then, is not as much one of distance from the centers of

[TEXT CONTINUED ON PAGE 30]

6: Ducey E-4,5 (1953-1954) 1956 ES10 Highland Scots ES10 Skye

48 population as it is one of accessibility. It is, for example, 131 133 only 165 miles from Glasgow to Mallaig, but the trip takes six hours because of the constant succession of curves and the series of severe gradients over which the railroad runs.

The General Appearance of Skye

131 133 Skye has an irregular shape. Large peninsulas extend out into the Minch on the northwest and into the Sea of the Hebrides on the southwest. Promontories, divided by sea lochs, reach out to the west and east. Numerous small lochs and several large, sheltered bays contribute to the greatly indented coastline. 103 While philologists may doubt the derivation of the Gaelic name for the Island, Eilean Sgiathanach, from the Gaelic sgiath (a wing), "the winged isle" aptly describes Skye.

133 From the mainland, the Island appears to be dominated by the jagged silhouette of the Cuillin Hills. Rising in fifteen angular peaks, these mountains are the first indication that the surface of Skye is as irregular as its shape. The characteristic typological features of the Island are the result of volcanic action in the Tertiary period of the Cenozoic and subsequent erosion, particularly during the Pleistocene when glacial ice flows gouged and scoured the landscape.[1] Geologically Skye consists of an extensive basalt plateau; two intrusive masses, one of gabbro and the other of granite; and a complex of older differentiated strata and outcroppings which include Jurassic and Cambrian limestone, Torridonian sandstone, and Archaean gneiss.

[1] F. Fraser Darling, "Relief, Landforms, Vegetation, and Communications," The West Highland Survey, F. Fraser Darling et al. (mimeographed, 1950), Part II, pp. 26-28.

Skye

133 North of a line between Lochs Sligihan and Eynort, Skye is a typical basalt plateau. Generally, it is a low-lying region of deep glens, rolling moors, and small hills. Mountainous terrain is encountered only in Trotternish and Duirinish. In Trotternish the land has faulted and uplifted to produce a long ridge of cliffs which rise to 2,360 feet. The uplands of Duirinish culminate in MacLeod's Tables, a pair of flat topped 133 134 hills (1,601 and 1,538 feet). This basalt area is Skye's best agricultural asset. The rock easily breaks down to form a potentially rich, light loam and the porosity of the basalt facilitates drainage.[2] Unfortunately, the potentials are not 132 always immediately available. The heavy rainfall and configuration of the land prevents the accumulation of deep soils. In addition to shallowness, the marked common characteristics are lime, phosphate, and cobalt deficiencies, acidity, heavy leaching, and water logging. An extensive, irregular overlie of peat is a further restricting factor. Except for the western slope of the hill ridge of Trotternish and, to a lesser degree, some parts of Duirinish, blanket bogs of peat will not allow the basic nutrients of the underlying soil to be brought into circulation. There are, of course, raised beaches and well drained terraces throughout the area with relatively good arable land. The relative fertility of northern Trotternish has been recognized for many centuries. It has long been known as "the Granary of Skye."

[2] Darling, loc. cit.

Skye

133 South of the basalt plateau, the Cuillins and the Red 34 Hills have intruded into the lava. Although the Cuillins dominate the landscape for many miles, they are absolutely 103 useless agriculturally. Indeed, a case might be made for the derivation of the name Cuillin from the Welsh coolin (worthless).[3] The worthlessness of the mountains in the local economy is attested by the fact that they are the only mountains in Scotland with peaks named after men, all of them mountain 133 climbers of the last century.[4] At the same time, however, 34 they have become a valuable asset in the tourist trade.[5] The 48 Red Hills rise to 2,537 feet. They are mostly covered with scree and skeletal soils, but they have some pastoral value. All have traditional Gaelic names.

133 Below the mountainous region a broad limestone valley extends across the island from Broadford Bay to Lochs Eishort and Slapin. Like northern Skye, it is a gently rolling region 133 with few rises which exceed 500 feet in elevation. The potentially good soil is frequently masked by a heavy overlie of peat.

Sleat, the southernmost peninsula, reveals a compli- 131 cated structure, a complex of ancient rocks and moraine.[6]

[6] Darling, op. cit., pp. 28-29.

133 The northeastern end of the peninsula is covered by glaciated
134 rounded hills rising to 2,396 feet. The remainder is a low-lying area of soft rises and deep glens. The soil cover is largely no more than a physical medium. Were it not for ston but light, well drained soils on several raised beaches and morainic soils derived from the mainland, large parts of Sleat would have no cover other than ice scoured rock. Peat covers many of the flatter facets.

Despite the multiformity of the physical appearance
133 of the island, one cannot help forming the impression of a
137 certain sameness. Except where bare rock stands out in stark relief or where man has laboriously turned the soil to agricultural use, the flora of Skye is primarily grass only occasionally interspersed with a few trees. In the glens and on the lower slopes of the hills fescue and bent grasses
[34] are found wherever the natural drainage is good. Both are tender and excellent for pasture. Poorly drained land suppor coarse sedges and rushes. Above 300 feet moorgrass is found on dry facets and rushes and mosses on soggy ground. The hi hills, such as the ridge of Trotternish, maintain a sub-alpi pasture of small flowers, mosses, and sparse grass. Obvious the main factors governing the natural flora are drainage an
137 altitude. Man and his stock have also influenced the vegeta
341 Selective grazing by sheep has allowed the spread of a large tough fern, called bracken, which has markedly reduced the
137 pastoral value of extensive tracts of the best land. Anothe common plant is heather. True heather moors, however, are

INTRODUCTION

133 mica-sparkled gneiss show the intense shearing. And crushed rock,
135 known as flinty crush because it splinters so easily, adds another sight for the modern eye. The Stornoway beds, as they are called, are broadly known as torridonian sandstone, old red sandstone, or triassic; some geologists regard them as part of the pre-Cambrian torridonian series.

133 From geological evidence, twice did vast icesheets move over the rock-faces to round off the sharp corners of the island. And, as individually then as now, geologists think that there may have been a third small glaciation—a private Hebridean one. Today, the scenery bears the imprint of glacial striae or scratchings. Polished rocks show scores; lochs are gravel-damned, and there are countless small lochans and tarns formed from deep gougings in solid rock. There is some evidence too of a depression or land-sinking during a much later post-glacial time. Many times have fishermen found, far below the present high-water line, stumps of trees and buried submarine peat, the wasting remains of former
*175 land vegetation. Martin Martin, who wrote of the Western Isles
133 about 1695, said of Berneray, one of the small islands in the Sound of Harris: 'The west end of this island which looks to St Kilda, is called the wooden harbour, because the sands at low water discover several trees that have formerly grown there. Sir Norman MacLeod told me that he had seen a tree cut there, which was afterwards made into a harrow.' These vegetation remains indicate
• [134] a former fertility. Volcanic action and deposit, the makings of good soil were, however, largely carried away by glacial movement to leave a thin scraping of boulder clay clinging to the base rock for dear life.

133 Lewis is largely rolling moors of blanket peat with many lochs and rivers. To the west of Lewis, in Uig, high hills begin to raise the eye. In North Harris, the hills are higher, reaching their peak in the Clisham (2,622 ft above sea level). These are not strictly speaking mountains. But they do present not a few problems to climbers, having some formidable rock-faces, and on the seaward side are virtually unscaleable cliffs. Much of the ice-moulded
[135] landscape of South Harris is rocky and barren, gneiss outcrops
[137] cover many acres in places, and are almost completely devoid of any kind of vegetation, except where, in the odd crevice, like lurk-

ing thieves, patches of heather, deer-grasses or moorland plants live as they can on thin layers of peaty soil. To relieve the hard scenery there are, on sunny days, glintings of water, lochs or rivers flowing uneasily over beds of primordial rock.

Area (in acres)

	Land	Inland water	Saltmarsh	Foreshore	Tidal water	TOTAL
Harris	123,752	3,110	—	6212	105	133,178
Lewis	404,184	24,863	230	7775	150	437,200

PEAT AND RIVERS

The peat overlays of the island are reckoned to be not much more than 7,000 years old. To strengthen this figure, when the megalithic circle of Callernish, on the west of Lewis, was excavated by Sir James Matheson in 1857-8, a depth of 5 ft of peat was removed to expose the giant stones. Only the tops of these stones were showing before excavation was begun; the resultant calculation confirmed the age of this infertile blanket. Peat is decomposed organic matter without the sweetening of lime. The resulting material is sour, and highly acid in character, which checks the bacterial action necessary for good soil to be made. With compaction and age, peat becomes colloidal in texture, with a water content of about 92 per cent. Peat is still being formed in Lewis, though its progress is imperceptibly slow.

Frequent diggings have uncovered evidence that the island was once densely wooded. The remains of trees, and the bones of certain animals and birds associated with savannah and woodland, add point to this. Under the blanket of peat lies what is called boulder clay, glacially deposited on the gneiss rock; many acres of this clay have been exposed through centuries of digging up peat for fuel. Such skinned ground is called *gearraidh*, and it forms the basis of a soil which, when worked together with shell sand and seaweed, becomes quite fertile. Of natural soil, so much taken for granted in richer places in Britain, there are a few patches in Lewis, at Garrabost and Ness; the valley of Strond, near Rodel in Harris, has much strong red loam.

Headrick's recommendations. However, he promised to make experiments on the economic value of the 'bog-ore of iron' found in many parts of the island, with a view to making bar-iron. Peat was to be used as a fuel for smelting.

With so much water on the island, it is natural to expect to find some of it harnessed for the generation of electricity. The Gisla hydro-electric scheme is on the west of Lewis, to the west of the shores of Little Loch Roag. The Harris scheme is at Loch Chliostair, at the foot of the three peaks of Tirgamore (2,227 ft), Ullaval (2,135), and Oreval (2,165). Some 12 per cent of the island's total electricity production is generated thus, the remainder being diesel generation at Stornoway (see Chapter 11).

Next to water, the island's most readily available resource is its stifling blanket of peat, which covers more than 80 per cent of Lewis's land area. It has had a more than significant effect on the natural history of the area, its scenery and the human element. When the deposits were examined in varying detail in 1910-11, it was estimated that they covered no less than 230 square miles, in depths up to 16·5 ft; the average depth of peat over the whole island was assessed at 5 ft. On this basis the deposits would contain approximately 85 million tons of solids. A survey carried out by the Peat Section of the Department of Agriculture & Fisheries for Scotland in 1952 indicated that the earlier estimates were slightly high.

In 1946-7 the Ministry of Fuel & Power reconnoitred the peat deposits on both sides of the Stornoway-Barvas road and indicated that these were suitable for large-scale utilisation. Yet today, despite these Government-backed investigations, the peat deposits of Lewis are still used only for domestic fuel. One of the points made in a 1952 survey was that the area was generally firm enough to take the weight of various bog machines for digging and milling. Another point was that the calorific values of ten out of twelve peat samples were in excess of 10,000 BTU/lb.

CLIMATE

The rainfall has already been mentioned, averaging an annual 43 inches, according to readings taken at the Meteorological

HISTORY

172 of these prehistoric remains indicates that before the Christian era began the island supported a considerable population. Generally speaking, the remains left by unrecorded history indicate three phases of cultural and economic development: the Stone Age, the Bronze Age, and the Iron Age. The dates usually associated with these 'ages' are approximate where the island is concerned. Because of their remoteness and isolation, the inhabitants may well have reached, say, the Bronze Age state of civilisation at a much later date than did people living in more direct contact with civilising influences. It has been conjectured that, where Lewis is concerned, peat several feet thick may have covered much of the ground which, in another time, was cultivated and lived on; and that the peat blanket hides the remains of very old constructions. Chambered cairns, duns or forts (round towers) built in lochs, by the seashore and on promontories, galleried duns, earth houses, standing stones, stone circles and ecclesiastical ruins are all to be found.

[133] [134]

The duns, or brochs, are believed to have had a defensive function, acting as lookout towers. Primitive dwellings would have been scattered nearby, with generally free-ranging livestock. If attack threatened, inhabitants and cattle together entered the tower, whose double walls held rough but welcome compartments for temporary living during the siege. Sometimes a dun was built on an islet in a freshwater loch, such as Dun Cromore in the Lochs district of Lewis; there is a similar example in Loch Bharabhat in Uig. A stone causeway connects each with the nearest point on the loch shore. Many of these causeways had a rocking-stone, a stepping stone so placed that the weight of a foot on it rocked it enough to warn the inmates of the dun that someone was approaching.

[712]

The most famous of the round towers is at Carloway, perched on the crest of a rocky slope on the west coast of Lewis near the crofting township of that name and overlooking much of Loch Roag. Its average external diameter is 47 ft, the walls varying in thickness from 10 to 12 ft. Though in a ruinous state, one side of its wall is still some 30 ft high. Dun Carloway is, after the broch on the Shetland isle of Mousa, the finest example of its kind in the country. About eight miles from Carloway, at Bragar, is Dun

Lewis and Harris

5 AGRICULTURE AND FISHING

THE economic possibilities of the peat blanket of the island, 175*
particularly in Lewis, have attracted the attention of many 134
would-be exploiters. Sir James Matheson's advisers formed 311
the idea that the Lewis hags could be turned to a good profit, and Sir James's series of peat reclamation and improvement programmes are still echoed today. He first cast his eye to the west, north of Achmore, a township set up more than a century ago on deep peat. The peat reclaimer he employed was none other than Alexander Smith, one of the best-known 'speculative' agriculturalists in Scotland at the time. Smith had already transformed the Carse of Gowrie from bog to a fertile tract of land; could he not do the same in Lewis? The site chosen was seven miles from Stornoway and the little hamlet established there was called Little Deanston, in recognition of Deanston, Perthshire, to which Smith belonged. The soil consisted of bog-moss, varying in depth from 3 to 8 ft. Sixty acres were wedge-drained and laid [242]
out in fields of ten acres enclosed with ditches and turf fences. Ploughing and trenching began and fertilizing agents were applied, including clay marl, shell sand, guano and dissolved bones. Two of the fields were put through a course of arable cultivation, the others being laid down in grass. After the fields had been worked for a few years it was found that the driest ground gave the best results. In time the land was handed over [241]
to some crofters from nearby Lochganvich, but in 1850 it was abandoned because of the difficulty in getting seaweed for manuring; and besides it was not possible to keep the land in good heart and to do fishing as well. The tract of land concerned today still shows a better quality of pasture than the adjacent natural moorland.

Smith gave his impressions voice in 1844, just after his first 175*
visit to Lewis, to the august members of the Glasgow Philosophical 241
Society. The cultivation of the soil was as primitive as the 134
311

 181

AGRICULTURE AND FISHING

*175 241 • 134 311 [181] islanders' manufacture of cloth. The inhabitants were at least a century behind the times, though they were, he found, in no way deficient by nature. They were social in their own style, and they had very good heads, 'that is, for people not accustomed to habits of thought'. So far as agriculture was concerned, nothing in the way of draining the land had ever been accomplished; nor had any effort been made to penetrate the hard sub-soil. He held that [137] the great scarcity of timber had been a serious handicap when [412] it came to agricultural implements—to their renewal, repair or possible improvement. Under direction, however, he was convinced that improvements in land use would result in considerable benefits to the island. He added that he hoped the period of this improvement would not be far off and that visitors would find 'a green, pastoral land instead of a dreary waste'.

*175 242 134 311 Yet not until 1928 was peat reclamation and development again brought out for an airing. This time, the benefactor was the late Mr T. B. MacAulay, a Montreal magnate, a son of Lewis connections. He gave £10,000 to establish an experimental farm in Lewis, and a site on Arnish moor, not far from Stornoway, was chosen. It was typical of most of Lewis: black, water-holding peat, which when squeezed, instead of allowing water to escape from it like a sponge, oozes itself through the fingers. The aims of the farm were to provide additional arable land on which to grow winter fodder, and to improve, at as low a cost as possible, the grazing on the moorland. Fifty acres were certainly converted from moorland to arable, and this formed a basis for an experimental extension to another 100 acres. By 1936 the farm had a sales income from produce of about £1,400. The stock in that [231] year included 40 head of thriving cattle, including 15 dairy cows, 20 poultry, 140 blackfaced sheep, and some fattening pigs. The sheep were a late addition, made with the dual aim of pasturing on moorland too deep and soft for cattle in wet weather, and of improving the sheep strain of the island.

By 1938, it had been shown that some lasting improvement on moorland of reasonably favourable slope could be effected at a materials cost of about £3 per acre, and without heavy-labour costs. Thus, the common grazings held by the crofting townships could be improved, if a co-operative effort were organized. So

AGRICULTURE AND FISHING

far as the reclamation of arable land from moorland was concerned, however, requiring as it did under-draining and cultivation, the labour costs were heavy, approaching the £20 per acre mark including the liming and fertilizing. 175* 242 134 • 311 [234]

Though the farm was used for dairying with some reasonable results, the moorland acres put into good heart at Arnish were left to deteriorate. The run-down of the experiment followed the depression of 1933. Funds dried up, and in 1939 the farm was let to a tenant. But the lesson obtained from the MacAulay farm was a good one. By simply dressing with shell sand, of which large quantities are available on the shore-lands, applying some form of phosphate and seeding with cheap clover or ryegrass—involving no cultivation—large areas of moorland can be persuaded to do a good job. The work at present being undertaken by crofters to improve moorland grazing is worth mention. Areas of land have been given a surface application of approved compound fertilizers, phosphates, lime or shell sand, and selected grass-seed mixtures. The results are literally a sight for sore eyes, and bring Alexander Smith's 'green, pastoral land' close to realisation. Although individual crofters have taken advantage of the help given to regenerate rough grazings, the most spectacular results have been seen on the township common grazings; most of these have been fenced off and improved. Today, something like 14,000 acres of lush green pastures are steadily spreading over deep peat where formerly grew only sedges and brown heather. 134 311 241 242

To end this aspect of land use in Lewis on a historical note, the story of re-seeding had its beginnings during the time of the Napoleonic Wars. A minister who had some land at Barvas, on the west coast of the island, decided to attempt the reclamation of useless heather-bound and bracken-choked land. He sanded the area with shell sand, seeded it with a good strain of grass and used sheep to tamp in the seed. One can imagine what Lewis would be like today if the Barvas minister's work had been followed up by Alexander Smith and those who set up the farm at Arnish. 134 175* 311 242

A HARRIS VIGNETTE

HARRIS'S OFFSHORE ISLANDS

Scarp

361 Until 1972 Scarp was the most westerly inhabited island in Scotland, separated from the Harris mainland by a strait which is about half a mile across at its narrowest, coursed by strong [133] tidal currents. The island is about three miles in diameter, rugged, especially in the north and west, with cliffs on all sides; 361 the maximum altitude is nearly 1,000 ft. On the east side lies a 311 tiny marginal belt of good land, machar and soil; on this green shelf, about one-third of a mile long, were all the crofts of the • 134 Scarp settlement. Many stand deserted, and abandoned lazy-beds [241] in sites beyond the present settlement indicate a denser population at one time. The island's population-carrying capacity was severely limited by the minute amount of land available for tillage: of a total of about seven square miles only half a square mile can be used. Climatic conditions and soil type also restrict the range and quality of crops grown.

*175 361 Scarp was originally settled about 1810 and was occupied by eight farming families who were reasonably comfortable. Not only did they have the island to themselves, but they had access to good pasturage on the Harris mainland opposite. About 1823 [166] thirteen small townships between the head of Loch Resort, Harris, and Bunabhainneader were cleared, some of the displaced families coming to Scarp. Some emigration back to Harris took place in the 1840s, but when about 1868 the proprietor divided Scarp into sixteen crofts instead of the previous eight holdings, these were further divided by the people themselves, trying to accommodate [162] their families and friends from elsewhere. In 1861 the population was 151; the peak was reached in 1881 with 213 persons. In 1951 it was 74. Communication with the Harris mainland is by boat, plying between two stone-built jetties.

433 241 234 226 354 336 000 The local economy was essentially a subsistence one, with self-sufficiency in such products as potatoes, turnips, cabbages, oats, milk and fish. After a break of some years lobster-fishing has recently been reinstated as an occupation. Oil lamps are the only lighting, though a few houses have piped water. The small shop 176

178 follows that as the descendants of the crofters of the South-west and East Highlands could and did change their ways within the space of a lifetime, so those of the North-west 114 Highlands and the Isles can change too. Given the co-178 operative leadership which is arising in the twentieth century and was totally lacking in the ideals and training 185 typical of the nineteenth, that change may be not only for the better in the development of 'individual' qualities, such as the power to do hard work for 'success'; change may also maintain and develop what still remains of the old characteristics which gave the community life of the Gael, with all its faults, elements of beauty and sanctity.

In an article on "The Human Geography of Lewis", A. Stevens (1925) described the Island and people. His comparison of the cold, wet 'desert' of Lewis and its corn-patch 'oases' with the desert of heat and drought [182] and its oases of palms, is ingenious and suggestive. One [241] might follow up the analogy and compare irrigation to the drainage of moorland and its fertilisation, which form the means of reclamation at home, and draw parallels between their immediate results on the land and the ultimate effects on work and social life.

194 241 • 134 178 Until the agricultural revolution, the unwritten story of Scotland was in great part that of a long, uneven struggle to make sour soils fit for cultivation and productive of a livelihood. Most of all is this true for North-west Scotland; moreover, there, for eighty years past, the struggle has been a losing one, in the sense that arable land has been 241 decreasing and rough pasture deteriorating. In spite of subsidies, the 'marginal farms' of Scotland have a tough 134 fight. Yet lands from Scandinavia to Finland and North 178 Germany are giving a lead in peat-reclamation, where [654]

241 Scotland had begun to lag since her pioneering effort from • 134 1750 to 1880.

178 Fortunately, Scotland is now recognising that in peat [654] reclamation, on the one hand, and the improvement of rough grazing, or at least its maintenance, on the other, [185] there lies a problem of national importance. More than half the land surface of the country consists of mountain 311 and heath land used for grazing, not including 'deer forests' from which sheep had been altogether excluded. The arable land of Scotland is less than one-sixth of the whole, with about one-twelfth in addition under permanent grass. Moreover, since most of the enclosed land is distant from the area of rough grazing, the latter is partly wasted. The difficulties of soil and sea and of the whole economic situation are great, and must be understood.

(B) THE ISLAND LANDSCAPE, LAND-FORMS AND GEOLOGY

1. Aspects of the Isle

131 Lewis-and-Harris, the most northerly isle of the Outer Hebrides, and the largest, is roughly lozenge-shaped. Although only thirty miles in width, it is over sixty miles in length. Attached to Harris parish is the little isle of [103] Berneray, half a dozen miles farther south. It puzzles [823] the stranger that, while the archipelago of the Outer Hebrides is best known to the inhabitants as "The Long Island", Lewis (or the Lews) and Harris, which actually form one island, are spoken of as separate islands.[1] Yet nothing could be more natural. Before the making of [113]

[1] "The Long Island", Gaelic *An Eilean Fada*, as a name for the Outer Hebrides has the sanction of traditional usage, as Alexander Carmichael noted in his Introduction to *Carmina Gadelica* (vol. i, 1900; and 1928).

131 summits of up to 2622 feet. South of this chain of hills
133 the ground drops again on a peninsula some twelve miles long and only seven miles wide. This forms the more populous part of Harris with its 'sandy shore', the Machar, facing the Atlantic, and its rocky bays and fishing hamlets
• [134] on the Minch.[1] Lewis has its 'machars' too, areas of
[504] white shell sand, which is so light that it blows up the hillsides, thus improving the pasture-land; but there is little 'machar' on the eastern coast, save for the south-western shores of the great sandy North or Broad Bay, enclosed by the peninsula of I, or Eye, which also acts as the outer breakwater for the harbour of Stornoway.

131 Landing at Stornoway and leaving behind us the pines,
133 and the wind-pruned sycamore woods around Lews
361 Castle, we find ourselves among the small fields of the villages which are partly suburban to Stornoway. Inland
[137] stretch the gently rolling, brown and somewhat melancholy moors that cover so much of the Lews. From the Butt of Lewis to the beginning of the Harris hills one could make a bee-line SSW., midway through the Island for over thirty miles, without passing a house or a strip of corn, and seeing only a tiny, ramshackle hut, a shieling (or *àirigh*), used for six weeks in the year when the cattle are taken to the summer pasture. All the villages are in sight of the sea, and generally close to it, with only one inland exception, Achmore, south-west of Stornoway, founded after 1850. The hills of Harris are not less lonely than the moors of the Lews.

18 Diversity is one of the fascinations of such an island
131 as this. Although, like the founders of Stornoway, all
133

[1] *Am machair* ('ch' as in 'loch', also anglicised as 'macher'), n.f. the plain, smooth beach-land or links. A sandy beach or ebb-strand, *tràigh*, n.f., backed by *machair*, contrasts with a pebbly beach, *cladach*, n.m., backed by rougher beach-land, as in the Cladach district of W. Lewis.

133 tively to the rolling upland in the north. Ages of 'normal' denudation by running water must have worn away most of what later rocks may have overlain the gneiss, smoothing the Island's forms. Glaciation, however, played the latest part in this process, roughly planing its lower surface as it flowed out to the open sea, or widening the stream-veined valleys and gouging out the corries which make the craggy beauty of the Deer Forest of Harris.

A characteristic of many of the lower hills of South Lewis and of Harris is the greater steepness of their slopes to west than to east (or south-east) and the drift material heaped there. Scenically, this lends a feeling of rhythm to the skyline when viewed from north or south, as of westward moving waves. It was the ice-sheet, working upon structure and pre-existing form, which steepened the western slopes 'to lee' of its westward flow, by its 'plucking' action.

133 The chief and most important characteristic of the
137 major surface of the Island is its rolling, hummocky topography, so different from that of a river-sculptured
[182] land. Negative as is its influence upon the life of plant communities, animals and men, its importance can hardly be exaggerated. Whereas river and stream drain a land, as they etch their way into its surface, and their deposits are laid down in gentle, regular slopes, glacier and
• [134] ice-sheet leave an irregular, ill-drained surface. Upon this surface, waterlogging takes place, the life of plants and soil bacteria is slowed down, and so peat accumulates, rather than the humus which might enrich the soil in a similar temperate climate upon better drained slopes. Not only the climate of the present, but of the past, hinders the processes of plant life, and all that these can mean to man.

133 Except for the sandy bays hidden beyond the headlands, or the long machar of west South Harris, the coast of the Island at high tide rises straight from the undermining breakers, rugged and uncompromising. A series of sandy 'storm-beaches' links the lower promontories, but the series of raised beaches found on the mainland and the inner isles seem absent round the Island. Along the western mainland and the Inner Hebrides, a secret harmony links the lines of the sea with those of the land, even on their wildest coasts of gneiss. Above the level plane of the sea, the shores of the mainland rise in rhythmic curves, tier above tier, some 10, 25, 50 and 100 feet, above the present line of waves and the triple band of colour which marks the shore at ebb-tide, formed of golden tangle, grey barnacles and pitch-black rock. These tiers are the 'raised beaches' of a coast which has emerged, by stages, to some 100 feet above the sea.

Lacking the raised beaches of an emerged coast, the Outer Hebrides show no clean-cut terraces like those of the mainland, inviting little communities to lay out their
[241] homesteads in an orderly way. For this reason, the older,
[361] unplanned crofts spot the landscape in an irregular way which is sometimes picturesque, yet often almost uncouth.
• [134] The raised beaches have given the Gaels living east of the Minch a few precious acres of passable ploughland which would otherwise be lacking. In the Outer Isles compensation is found on the smooth machars of shell sand. These machars lie mostly on the stormy Atlantic shore, so that the more cultivable fringes of the Outer Hebrides turn their back to the mainland—except round Stornoway, a reason for their isolation.

In detail, the coasts may be grouped in three types: (1) sloping to the sea, by the sides of sheltered lochs;

133 (2) cliff-cut, where exposed stretches have been undermined by the Atlantic storms; and (3) sandy, where bays like Broad Bay have been filled in, or where shingle bars have enclosed a sheet of fresh water, as on the west coast (north-west of Stornoway) from Barvas southward to Dalebeg. The types of coast are illustrated by Plates II to V.

As to the sea floor—so important to fish-life and to navigation—the west coast of the Outer Hebrides borders a well-featured continental platform, which is higher in the north and south but lower in the middle. The irregularities suggest a former land-surface dissected by rivers with mature drainage systems.[1] The contours are revealing, as shown in the coloured map at the end, at intervals of 10 fathoms (60 feet). The sandy machar beaches of western South Harris, visible at low tide, form part of a wide, shallow shelf extending for a dozen miles off west South Harris to a depth of no more than 20 fathoms, and thence southwards along the machars of Uist to Barra; but the coast falls away steeply round most of Lewis and along the rocky east coast of 'the Long Island'.

5. *Glacial Drift or Boulder Clays, and Shell Sand*

Underlying the peat is the drift, which is spread over
133 all but the rockiest parts of the island. This is not only
314 exposed at every roadside cutting but is laid bare in wide areas around the villages. Here peat-cutting during the centuries has removed the peat, layer after layer, to the
[356] topmost turf, left aside after cutting until the last. When
• [134] even this turf is removed for annual thatching, the bare
[113]

[1] S. Ting, B.Sc. (China). *Geografiska Annaler*, Band 19, 1937, pp. 62-83.

133 clay is exposed, leaving what is vividly called 'skinned'
314 land. And where drift is exposed, the mineral constituents
• 134 are leached out, and a hard 'moor pan' is left a few inches
[356] below the surface.

Seen from the edge of the crofts, the typical 'skinned
134 lands' of bare, blue or brownish clay, littered with stones,
137 suggest a desert. Often, only a few blades of grass or tufts of heather grow on them. Indeed, 'skinned land' seems at first too mild a term, for on it the stones—thickest on top when undisturbed, and bleached by the acids of the peat that overlay them—suggest the prophet's 'field of bones'. One can only ask, is the rest of his vision ever to be fulfilled and life to spring again? In some hilly parts to south and west, not only the 'skin', the topmost layer of peat, but the very soil, the flesh as it were, is still being
[166] stripped bare to the bone, the actual rock. The evacuation of the islet of Bernera Beag (Uig) was largely due to this stripping. In the more level parts to the north, however, roadside pits show sections of clay with few stones, covered with perhaps six inches of clay with many stones. It is this top layer which gives the skinned land such a hopelessly stony appearance, and shows that reclamation is less miraculous than it seems.

134 With the coming of carts and lorries the increasing use
242 of shell sand has become possible, whether for spreading on the land or for slipping into pockets, together with
[178] fertilisers, for potato seed. As to soils, shell sand and boulder clay possess complementary qualities in texture
[493] and chemical composition. The shell sand of the machars provided an early home for man, the light soil allowing rye, a poor variety of oats, and herbage, to ripen early and mature in late, wet seasons when the clays are sodden with rain. Yet the sand itself is so light that drought is

a danger, and an unseasonable gale may blow away the furrow and ridge with the seed. As a partial remedy, seaweed and turf are mixed with it. On the whole, land-forms and soils, and the climate of the past which helped to make them, are factors of difficulty for plant and man.

Two sayings sum up the lag of the sea and its effect on crops. The first runs, not till after New Year, nor Spring till a Day" (*Cha tig Geamhradh gu cul Calluin cul Fheill Paruig*). St. Patrick's Day is th but old-style reckoning put both dates other runs, "A frosty winter, a misty spr summer, and a bright, sunny autumn, ne Scotland" (*Geamhradh reodhtanach, Ea Samhradh breac riabhach, us Foghar ge d'fhag gort riamh an Alba*). The retort western summers may often be chequer showers well suited for growing grass autumns are not really sunny, but rainy. —of grain—must result from spoiled harv grass, unharmed by a wet autumn. Hay, possible, can usually be gathered unharme of summer if cut in good time. Agricultu favours 'grass' rather than grain.

Plentiful rainfall and coolness throug not allow of complete neutral decomposi matter in the presence of air. Hence, residuum of acid humus accumulates as drained surface. Prehistorically, more f of climate permitted the growth of pines present temperature and rainfall alone w growth of broad-leaved deciduous trees absent except in the sheltered policies of S About 1695 Martin noted 'hazel and bir the south side of Loch Stornoway, but no Island. Even there trees are stunted as wind.

134 that no initial reclamation had been needed on the scatt.
241 In each year of cultivation, it is true, manures of a sort, principally seaweed and sooty sods from the roof, are applied; but they form a temporary improvement only for the crop to be taken, and do not constitute reclamation. After manuring, the grasses and clovers are simply turned over and the land, 'rested' and manured by cattle, straightway gives its best crop.

175 It is otherwise with what is won from the moorland.
311 As Dean Monro wrote of the reclaiming Lewisman in 1549: "In this country all is peat moss-land at the sea coast" (the long machars of the west of Uist give place to rocky coasts round much of Lewis), "and the place where he wins his peats this year, there he sows his corn the next year; after that he guids it weill with sea-ware". Even where the slopes are fairly smooth, the peat land has not the uniformity of the machar and the continuity of its arable strips. In addition to sea-ware, sand may be brought by creel or by pony pannier to reclaim peat, forming a heavy burden. Moreover, the first crop is always a poor one, and may be almost lost. Although in his brief notes Monro used the singular 'he', we know that the peat was usually cut co-operatively by teams. Hence most of the hard labour of reclamation may, indeed must, have been done co-operatively too, but by small teams, not by the members of a whole township together.

233 The sharing of common pastures is the last, but im-
423 portant, feature of land holding in common. The two kinds of pasture required were, firstly, those close at hand, animals being tethered or herded in the crop-growing season, and secondly, the more distant summer pastures.
632] The people of certain townships, which were without a large outrun close at hand, had to go some distance to

137 ### 3. *Plant Communities of the Island: Hill Moor, Peat Moss and Machar*

The types of pasture in the Island should be compared with those elsewhere. The peat moors of Lewis resemble those of northern Sutherland. The machar lands of the Uists, and of Tiree and smaller isles, surpass those of Lewis, while on the mainland and Inner Isles raised beaches provide workable, well drained soils. The 'rocky hill pastures' of our Island correspond to the rockier 'mountain pastures' and 'plateau summits' of the Highlands, and the 'fair' and 'hill pastures' of Lewis rather to their widespread 'wetter moors'. Grazing conditions are of course, similar in crofting areas alone. The edging of heather above the sea-cliffs of the Island and on the western mainland forms a picturesque element of the landscape, seen from a passing vessel, but only a narrow strip of the pastures. The plant communities shown on the Map of Vegetation (Fig. 8) must now be outlined.[1]

[134] (1) On the *Rocky Pastures* the scattered patches of soil are covered by a low and close sward, almost exclusively of perennials and grasses, such as bent (*agrostis*), common and brown, sheep's-fescue grass and wavy-hair grass (*festuca* and *Aira*); small sedges and mosses, with club moss and lichens towards the summits; heather, and fine-leaved bell-heather (*Erica cinerea*); and flowering plants like thyme, bird's-foot trefoil, tormentil and smooth heath bedstraw (*Galium*). Those rocky pastures prevail in the Forest of Harris (Plate XI).

osses and Peat Hags.—The most

137 widespread plant community in Lewis is undoubtedly the
(133) *sedge and cotton grass moors* (or 'mosses' as they would be called in the Lowlands), which overlie deep peat generally at low levels, on flat or slightly rolling grounds. The peaty floor is waterlogged and boggy, and the carpet rises into tufts, dense cushions or mops, out of which bristle innumerable stalks, thread-shaped, sheathed, fibrous and elastic. There are few flowers apart from the bog asphodel, while heather does not thrive but is stunted. On the slopes, sedges (*Scirpus* and *Carex* spp.) and cotton grass (*Eriophorum angustifolium*) dominate, and in the hollows, sphagnum moss. Owing to slope and consequent erosion, the surface may break into hags (or 'bruachs'), separated by deep and more or less broad channels of bare peat with puddles.

(311) For reclamation by tractor and peat plough, smoothness is essential, combined with some slope for drainage. From observation of the fragments of poor pasture topping the hags in channelled eroded peat, it can be noted that drainage alone is not enough to create good pasture, though it
(241) is the first step. In order to complement the work of drainage, fertilisers must be applied to encourage plants which absorb water in quantity and transpire it freely in the course of rapid growth. For it may be said that plants like heather—adapted to withstand drought, physical or 'physiological'—do not transpire water in any great quantity. Thus they fail to 'drain the ground from above', as juicier grasses or fodder plants do by the vigorous ascent, transpiration and renewed absorption of water.

• (134) (5) *Heather Moor.*—The common heather (*Calluna*) dominates on many steep slopes and rocky bluffs, sometimes on acid humus, or again on decomposed rock and screes, generally at low levels. Among the chief plants

FICHE

137 Inset into the Highlands are three desolate tracts of
134 boggy 'Peat Moor', in Sutherland, Rannoch Moor far to the south, and on the plateaus of Lorne and Mid-Argyll; while marginal to the Highlands are (1) the drier and more dissected plateau peat moors between Lochnagar and Stonehaven, and (2) the intermittent stretches of Lowland peat moss.

137 Finally, intermixed with these are strips of surviving or planted woodland. Below the heather moors of the western Highlands stretch the great pine woods of Atholl, Deeside, and Speyside and the Moray Firth. As the heather thins out, towards the West Coast, pine gives place to oak. Near both are found the graceful silver stems of
[177] the birch, with its small resistant leaves. These woodlands invite the modern forester, who brings in pine, larch and firs in the east and, in the west, notably the Sitka spruce, brought here from the rainy western highlands of British Columbia.

311 The uses to which the pastures are or have long been
233 put, are three: as crofters' grazings—mostly 'commons' (and so indicated on the map), as sheep farms, or as deer
137 forests. (1) On the 'commons' there is close grazing for
[136] both cattle and sheep by crofters near the townships or the holdings, and much peat-cutting. (2) On the hill sheep farms there is more or less regulated burning and some hill draining but almost no cattle pasturing; and as a result of both facts, bracken has invaded the grassier moors.
[136] (3) On the deer forests almost no care is given and the heather, scrub and bracken are coarse and strong. An indication of the margin of the commons, according to whether it 'marches' with farms or with deer forests (given in Fig. 2 by line C), is also shown in Fig. 7 because of its marked effect on vegetation.

found with the dominant are the fine-leaved bell heather, sometimes with crowberry (*Empetrum*) in rocky places, while grass or sedge may be mixed with it in places.

At the very edge of the sea-cliffs, where the moorland pasture or heather thins out, the rock is cushioned with sea pink. Or where a stream has cut a sheltered dell, protected as in the Stornoway policies or not too near a village, one may find a few woody plants—a little hazel, creeping willow or honeysuckle.

(6) *Sandy Pastures.*—In many bays, as at Valtos (West Loch Roag) the sandy or sand-influenced habitat falls into three zones:

(*a*) The line of storm beach, formed of hummocky dunes, which dams off what was the inner part of the bay. This line is more or less broken where the stream breaks through. At their crown the dunes are partially fixed by marram grass (*Psamma*), but show hollows of loose sand. Just north of Stornoway the Melbost sands have thrown out a high bar which has partly dyked and reclaimed or poldered the bay behind. Almost at the opposite end of the Island, lying in from the Sound of Taransay, near Luskintyre, a sandy dyke is thrust out, but this too is kept open by tide and spate, and the sands within are covered at high tide. Such places could be reclaimed.

(*b*) Behind the dune ridge, where this is virtually complete, is found a dry sandy flat. Even this is liable to inundation by storm, tide and spate, but its sandy pasture is periodically broken for the cultivation of potatoes, or even barley. It is the lightest of soils at the best, while if cultivated continuously it simply

[132]

(c) FARM-TEAM AND BOAT'S CREW

175 241 427 476 423 The strictly equal division of rent on each joint farm shows the equality of sharing among its workers by 'run-rig'. By this system, periodic pooling and redivision kept the land in convenient blocks, a wet part here and a dry one there, all shared out to give each man an equal chance whatever the weather might bring. Such sharing was not mere static division of goods: it was the means for co-operative work, in ploughing and harvesting, or cutting peats, on land, and in manning a boat for the fishing.

175 241 476 For ploughing, two or three men were needed—one leading the horses (walking backward and singing his encouragement), a second to hold the plough and perhaps a third to turn the sods; but four ponies abreast were needed to haul the plough, and each tenant possessed only one or two. In addition, the plough might be preceded by an instrument to clear the ground, a 'reestle', requiring two horses and one man. A Gaelic proverb notes the selection needed in the horse team, and one disabled by age could be replaced as leader by another. Ploughing was necessarily co-operative.

175 241 [182] [134] [226] The rockiness and hilly ground of Uig and Lochs diminished the usefulness and, no doubt, the number of ploughs, but the importance of their fishing was some compensation for poor agriculture. In 1790 there were ninety ploughs in Barvas parish, where they were no doubt of ancient usage: a ratio of one plough to five families, or one per joint farm. To judge from the smoothness of Stornoway parish, ploughs were probably used there in a similar ratio.

175 476 While some jobs were done by no more than two people, —as when a ridge or 'lazy-bed' was put in order, the

423 rigs. The rigs are numbered and then balloted for by a
632 double ballot. First the men approach the hat in any
241 order and pick out a number: this is to decide the order in which they will approach the hat in the second draw. The second draw then decides the number of the rig. The crofter retains the rig while this particular scatt remains in cultivation, usually for a period of two or three years. The machar is shared by the whole township. The crops grown include a light type of oats, barley, a little rye, and potatoes; and clover may be cut.

423 In the division of the machar for potatoes at Barvas,
244 there are now no such hard-and-fast rules. The Common
[624] Grazings Committee select a certain area for cultivation and each crofter is allowed to take as much land as he requires within this area. This land is only cultivated for one year in six to ten years, and then reverts to grass. If cultivated for two or more years in succession there is a danger of the sand being blown away, and grass would be difficult to establish again. Potatoes are now the only crop
[134] grown on the Barvas machar.

Beyond the machar of the Isles lies the moor with its
175 fringe of reclaimed croft land. By Carmichael's day this
423 was held in individual portions, though, as he said, most of it was once held in 'farms' in run-rig practised by small
241 units, not by the whole township. Why this difference between the arable of the machar and of the moorland? Carmichael did not explain it.

134 Three explanatory points are, first, that the whole
241 cultivated land of the scatt or the machar is continuous, whereas the moorland is hummocky and boggy by turns, and cultivation is therefore patchy; secondly, that, unlike the stony clays, the light shell sand is easily forked or ploughed and needs no 'team' to plough it; and thirdly,

133 Over most of the parish the natural landscape is a series of low plateaux, generally below 250' O.D. around East Loch Roag, but rising westwards to an extensive platform with many summits around 500'-700'. Into this platform, towards its western edge, is incised the narrow trough containing Little Loch Roag. Above it rise the deeply dissected mountains of North Harris and south-west Uig, with many precipitous slopes reaching to 1,500' or more and summits to 1,885'. The discontinuity between plateau and mountain is particularly well displayed along the Atlantic coast, where it corresponds roughly with the junction of granite and gneiss; an even more severe discontinuity, but formed entirely in gneiss; is to be seen near the south end of Loch Langavat. Liuthaid (1,611' O.D.) rises more than 1,400' in less than a mile. The mountains, although lacking height, are therefore spectacular in appearance. The low plateaux are far from featureless, too; their surfaces have been roughened and scraped bare by ice action and numerous hollows preserve shallow lochans and a few larger lakes. Occasional rocky hillocks rise 20'-100' above the plateaux; their abrupt discontinuity with the smooth surfaces is entirely comparable, though in miniature, with that of the mountains. They resemble nothing more than tropical inselberge and have no apparent structural explanation.

Unconsolidated superficial material, such as would provide sub-soil drainage and suitable raw material for soil formation, is rare. The characteristic surface almost everywhere is bare rock, often blanketed by peat at lower levels and on gentle slopes. Morainic material is most commonly preserved in hollows; peri-glacial conditions and, 135 more recently, heavy rainfall have swept clear most of the higher and steeper places. In the east and north east, e.g. around Loch Carloway, a sticky grey clay with large boulders is sometimes seen; the coarse gravelly drifts of south Uig have already been mentioned. It is impossible to make any useful generalisations regarding the characteristics and distribution of the boulder clays because their occurrence is so sporadic and exposures, 317 beneath the peat blanket, are rare. Very occasionally, e.g. in Bernera, a finely bedded dull bluish or greenish grey clay is seen which is said to have been used for coarse pottery. This may be a lacustrine deposit of late glacial or early post glacial times or it might be a marine clay of the same period; there is however, no clear example of a raised beach in the area, which, were it present, might support the latter suggestion. 317 Since our visit a lacustrine deposit of diatomite has been exploited on a small scale in Bernera.

Extensive deposits of fine white sand occur around Uig bay and in the Valtos-Kneep-Reef area; smaller deposits occur at Mangersta and Mealasta. Except at Cliff bay, Valtos, where it contains a high mineral content, the sand consists largely of finely broken shell debris. This blows readily and is found inland for half a mile or more and as high as 100' O.D., thus providing a natural surface dressing rich in lime. There are extensive machairs (sandy plains) at Kneep and Reef, and smaller ones at Uig bay, Mangersta, and Bosta (Bernera). Little cultivation takes place on the machairs nowadays.

133 In the whole parish little soil, such as would be recognized by a lowland farmer, is to be found. The most usual surface features are bare rock and blanket bog; arable land, hay 134 meadows and improved pastures are generally made on peat, gathered together into long 140 narrow beds - so-called "lazy beds" - separated by deep ditches. This expedient may 23 mean that the use of tractors is impossible; since horses have almost disappeared, 133 cultivation in such cases, if carried out at all, must now be by the spade alone. This is 134 the traditional method of lazy-bed work; it may be very productive in terms of yield per 24 square yard but it is pathetically unproductive in terms of man-hours. In some areas it is clear that it has led to soil erosion. Even where the size and lay-out of the beds permits tractor work the tractor probably spends as much time manoeuvring into position and turning, as it does ploughing. In a few places, e.g. some of the East Loch Roag

[TEXT CONTINUED ON PAGE 7]

133 townships and at Islivig and Breanish, the peat is thin (or has been stripped) to reveal a 134 gravelly drift[1] free-draining on suitable slopes. In such places a black loamy soil has 24 been developed by cultivation; the many ditches of lazybed cultivation are not necessary 140 and, if the area is large enough, it can be worked by tractor. Such soils, in the climate of west Lewis, are eminently suitable for rotation grass, for hay or pasture, and much more could be done with them under knowledgeable management. Where shell sand has been blown inland on to peaty soils the natural top-dressing has had a remarkable ameliorating effect on texture and acidity. Such areas are all too limited, the most important are at Valtos, Kneep and Reef, and around Uig bay; smaller areas are at 134 Mealasta, Mangersta and Bosta (Bernera). The hill grazings are dominated by a thin 137 heather cover, blue moor grass and, in wetter places, sphagnum and cotton grass. Since 23 the cattle population has been declining many older residents claim that the pastures, particularly near the townships, have deteriorated, the proportion of grass declining and coarse heather increasing. "The hills that were green when I was a boy", said one, "are now black". Neglected arable and pasture land, too, t on reverts. Rushes and flags invade the ditches between the old lazy beds and, if the ground is at all waterlogged, soon invade the beds as well. Later ground, if not well grazed, soon reverts to heather. The limited machairs are little better; almost devoid of humus, they show little development of soil profile, only a thin grey layer of turf roots; rabbits, or injudicious cultivation readily set off wind erosion. Only where the wind has provided a natural blend of peat and machair are conditions better. Such areas are very limited.

132 The climate is in many respects severe; no local statistics are available, but some for Stornoway and Benbecula are appended. The frequency of high winds has a bad effect on both vegetation and stock, but to some extent wind counteracts excessive moisture. Near sea-level, where all the townships are situated, frost and snow are almost unknown. Thus it is exposure to the wind that limits the outwintering of stock, not low temperatures; this suggests that if pastures could be improved with a suitably sheltered places far more advantage might be taken of the relatively mild winter temperatures. It is believed that the sunshine record is particularly poor in the south, where clouds can frequently be seen hanging over the mountains when the sun is shining on Bernera and the area north 248 east of East Loch Roag. The relatively dry and sunny period which commonly occurs in 221 May and June ought to make for a good hay harvest; unfortunately the natural meadows, such as the rare, are late starters, and the custom is to cut the grass when it has gone to seed. Thus hay is often being taken in September - one of the wettest months in the year.

CHAPTER TWO

SOME HISTORICAL ASPECTS

172 Evidence of pre-historic and other early settlements in the parish is afforded by the occurence of standing stones, broche and dune. The Callanish circle and its satellites are by far the most remarkable ancient monument in the Hebrides, and testify to the former importance of the site even though today their precise significance may not be clear. Most of the dune are now little more than circular heaps of stones, but in that at 174 Dounc Carloway the double walls still stand to a considerable height. A later phase of 103 settlement is recorded in the place names, a very large proportion of which contain Norse 162 elements such as -nish, -vick, -bost and -shader; it seems probable that most of the present township sites have been more or less continuously occupied since Norse times.

1. [Presumably the author means "drift"--A alyst]

CHAPTER FOUR

THE ATLANTIC COAST

(Brenish, Islivig, and Mangersta)

by

Pamela M. Gough.

131 Brenish, Islivig and Mangersta are situated in the extreme south-west of Lewis, on the Atlantic coast of the parish of Uig and forty miles from Stornoway.

133 Brenish has a south-westerly aspect whilst Islivick faces north-west; in both the elevations of the croft decrease seawards from about 125 ft. in the east to 50 - 25 ft. in the west. Only one croft in Islivig, and the eight most southerly crofts in Brenish, run to the sea - the rest obtain some shelter from a line of low hills about 300 yards wide and rising to a little over 100 feet, which forms their western boundary. The land terminates in low cliffs from 25' - 100' in height, and a rocky foreshore. Behind these townships to the east a range of mountains from 1,500' - 1,800' in height and dominated by the highest hill in Lewis, Mealisval, (1,885'), gives protection from easterly influences.

Mangersta lies to the north of these mountains; here the crofts lie in a sheltered 134 valley to the west of which the land rises to over 200 feet. The valley opens southwards to the sea where there is a sandy beach and machair. The crofts range from about 150 feet to 10 feet above sea level; those nearest the sea have soils which contain a substantial proportion of machair sand.

Soils are generally deep, and there are few rocky outcrops on the crofts which are fairly level. In Brenish and Islivig the soils are mainly peaty, becoming wetter in the west. Where visible the sub-soil is gravel or stony boulder clay. In Mangersta the transition from peaty soils on the northern crofts to sandy soils on the southern crofts, is marked by the increasingly continuous cultivation, drains being unneccessary on the latter.

137 There are no trees or shrubs, and vegetation consists of marshy grass moors in the Mealasta area with a considerable amount of cotton grass bog further north. West and south of Mangersta the machair area is characterised by a calceole plant community similar in content to that found in many parts of the chalk and limestone areas of England.

34 Brenish and Islivig are old settlements, never cleared. In both, the sites of the 172 original clachans can still be seen clustered around the mouths of their respective streams. The houses are now situated at the east end of the crofts, near to the road.

175 To the south, Mealasta - cleared in the 1840's to make a sheep farm - was divided in 632 1921 to give enlargements to the common grazings of both Brenish and Mangersta. The 311 arable land was divided into twenty-nine shares as enlargements to Brenish crofts, and is held in a modified form of runrig.

Mangersta was cleared in 1837 to make a farm; subsequently fishermen-cottars settled on the farm but they moved to Dun Carloway in 1873. In 1910, however, a new township of thirteen crofts was set up by the Congested Districts Board; the new settlers were cottars, mainly from Brenish.

491 Brenish, at the end of the tarred road which also serves Islivig, is forty miles from 494 Stornoway. On the thrice weekly bus the return fare to Stornoway was £1, and freight 497 cost half-a-crown for a hundredweight, but because of competition from privately owned vans the bus service ceased in 1960. Mangersta is reached from the same road by about a mile of untarred side-road of indifferent quality; formerly the only access to it was by 366 a footpath over the sands to the south. General merchandise, fish and meat are supplied 205 by weekly vans; there are no shops. There is a post-office at Islivig; banking facilities 453 are supplied by a mobile bank.

311 The majority of the crofts are long narrow strips, with those in Mangersta being some-
422 what more compact. The area ranges from two to nine acres, with an average of about four acres; in Brenish and Islivick only about half is usually arable. All the crofts - or croft-units - are fenced, the work having been completed in Brenish in 1959. There are twenty-nine crofts in the rental for Brenish, ten for Islivick and thirteen for Mangersta; but, owing to amalgamations of various kinds the number of operative units is considerably less - fourteen in Brenish, five in Islivick and ten in Mangersta. There are no cottars.

134 As soils are reasonably good and comparatively free from rocky outcrops, the arable
307 patches are large enough to be cultivated with a horse or tractor. There is a tractor in
23 Brenish, and four horses, a horse in Mangersta and two in Islivick. All of these are hired for ploughing and carting peats. Very little work is done with the spade, unlike many of the other Uig townships.

233 While the general rhythm of township work through the year is similar to other areas, here the sheep are wintered up on the hills; some crofters winter lambs on their crofts. Brenish crofters are allowed to winter eight sheep, (or sixteen hogg, or four year-old heifers), on Mealasta Island - hogge are usually sent since their loss, by falling over the cliffs, is less - rather than the loss of heifers. Eilean Molach is used by Mangersta crofters, who are allowed two sheep each in summer.

241 The only crops grown are potatoes and oats, with "black oats" (Avena strigosa) on the sandy soils in Mangersta. Since seed for "black oats" is unobtainable commercially, the crofters save theirown. A grass mixture is sown by the majority of crofters for hay, to qualify for the subsidy.

233 The extensive hill and mountain pastures are not separately fenced; sheep from all three township graze over all. If the total sheep stock of the townships (about 3,300) is compared with the souming figures it is found to exceed the soum by about 50%. On the other hand, fewer cattle and horses are kept than formerly so that taking the total stock for all animals (horses, cattle and sheep) and comparing with the actual stock now carried, the area carries only 87% of the stock which the soum allowed. In the two older townships the souming was reckoned according to rent, being one cow, one two-year old and eight sheep for each £1. In Mangersta, however, the soum was one horse, three cows, one heifer, two stirks and twenty-five sheep for each croft.

Lambing percentage is about 80, and ewes form about 60% of the total sheep numbers
236 (excluding lambs). In this district some wedders are kept for three years and then sold
235 for meat, but the main income is from wool, about three pounds weight from each sheep, which sells at up to four shillings a pound.

231 Most crofters keep one or two cows, and the calves are normally sold in the autumn or spring sales. Brenish and Mangersta each have a bull, and in the three townships there are sixty-seven cattle and thirty calves. Shielings, formerly used for about seven weeks in

233 no road and access by foot is difficult. To reach the grazings the crofters travel by boat from Mealasta several times a year and stay in one of the two houses at Aird Bheag which, although vacant, is still in repair. These houses were formerly occupied by estate employees who had crofter status.

511 From the above account, it is evident that in this district as in others, a single croft is not sufficient to support a crofter and his family. On an average, each resident crofter has acquired the equivalent of two crofts, and in addition each crofter supplements the meagre income obtained from his croft by some other occupation, e.g. weaving, labouring, or driving.

CHAPTER FIVE

THE UIG BAY DISTRICT

(Carnish, Ardroil, Timsgarry and Crowlista)

by

Elizabeth Blowers.

134 Uig bay, in which low tide reveals several hundred acres of pure white sand, is surrounded by crofting townships. There is no extensive machair plaine but the shell-sand forms a fringe of easily cultivated, lime-rich soils on all sides except Crowlista, and, blown inland by the Atlantic winds, it modifies and improves the texture and acidity of the
361 peaty soil as much as 2,000 yards from the shore. It is not to be wondered at then, that
175 this bay at one time formed one of the most important centres of population in Lewis. Signs of ancient cultivation, and the ruins of old clachans, are widespread, but most of the present settlements are less than forty years old: almost the whole area was cleared to make farms in the early nineteenth century. Only in Crowlista, with its thin, rocky,
121 arable land and almost complete absence of machair, were the small tenants left undisturbed. Consequently the district provides an opportunity to compare "old" and "new" townships, both as to lay-out and operation.

133 Carnish, in the south-west, is dominated by a huge gravel ridge - probably an esker, -
361 over a mile long and sloping steeply to the estuary of Amhuinn Chaslabhat with the rocky headland of Machair Carnish to the north. The arable land and houses of Ardroil are situated to the landward side of the hummocky machair land between the esturies of Amhuinn Chaslabhat and the Forsa river which drains Loche Suainaval and Stacsavat. To the north of the bay the old settlement of Crowlista is situated on the rocky headland to the west of the Rethail embayment; there is a good deal of level land in the centre of the township but the slope to the estuary in the north is steep and rocky outcrops occur on the headland. Timsgarry, to the east of Rethail, stretches inland between the headlands of Tolanish and Borranish along the valley of the Erista river.

134 There is a mantle of gravelly drift over this area; the Carnish esker has been mentioned and exposures of up to 120' were also seen in gravel pits in Ardroil and Timsgarry. Along the coast blown shell sand rests on this drift and reaches inland for up to half a mile.

134 Alluvial soils have developed along the lower reaches of Amnuinn Thoraghair and the Erista river.

There are no trees apart from an occasional stunted rowan or willow - willows for
134 instance may grow still in some old garden enclosures. Hedges, too, are rare are, although
624 individual houses are often carefully sited, there is little cover and the townships as a whole are very exposed to westerly gales. The natural vegetation developed on the machair is of fine closely matted grasses with a good deal of natural clover - very similar to that found on chalk downland. On the peaty moorland the usual moor grasses mosses and heather are dominant, though little encroachment by bracken was noticed.

In Crowlista the strip layout of the crofts dates from a letting about 1850. (Figure 14)
311 in the new townships, laid out about 1921 (Figure 15) the majority of the crofts are
361 less strip-like and do not run to the shore. Indeed in Ardroil and Timsgarry only five
127 out of twenty-two reach the shore and the rocky headlands with their machair are valuable parts of the common pasture. The six crofts in Carnish run from the shore at the foot of the esker up its flank towards the southwest and almost to its summit. They also have one or two small plots each on the machair.

Crofts in Ardroil are in one piece. An old cattle road forms the north west boundary;
133 from this they rise, steeply in places, to undulating moorland just over 200' high. Numbers 5 - 8 Timsgarry are strips across the Erista valley, rising northwards to just over 170'; 2, 3 and 4 are allotted to make use of arable land on the lower slopes of Knock Valabrie. The houses of crofts No. 1 Timsgarry and No. 1 Ardroil are the former farmhouses.

41 In Crowlista most of the crofts remain unfenced but in Carnish, Ardroil and Timsgarry
41 all are fenced and many of the fences were being repaired or replaced in 1959. They are not open for common grazing during the winter. Patches of sown hay are fenced within each croft.

There are six recognized croft-holdings in Carnish; one is sub-let so that there are
36 only five "operative" units; two of those are not worked. One has been resumed by the proprietors and is being quarried as an extension of the main quarry between the township dyke and main road. In Ardroil each of the fourteen crofts is worked as a unit - though two carry no stock; in Timsgarry eight crofts are worked as seven units.

In contrast to the above, the old settlement of Crowlista has twenty-five recognised croft-lots, by amalgamation and sub-letting these are worked as fourteen units. The Crowlista crofts are small - fourteen are 4.0 acres or less and of those only one is worked as a unit. Crofts as small as 1.5 acres and with a score of eight sheep can never have been intended to support a family; they are the result of sub-division in earlier generations; the remains of two piers and a curing house point to the importance of
461 fishing in the past. Twenty-one men were employed in fishing boats about 1914. Sub-letting usually takes place between relatives; of some of the fourteen operative units are quite complicated. One example will suffice (croft numbers are here replaced by letters to prevent publication of personal matters):-

Crofts a, b, c and d are worked as a unit (although they are not adjacent). The tenant of a and b sub-lets c and d for grazing; he also helps with the work on yet a fifth croft. The present b is half of an original croft. West of the road the original croft is held in fixed runrig between b and another croft, one part of this multiple "working" unit; east of the road it has been divided into separate strips. The tenant lives on b.

361 Many of the original houses are ruined or used as byres. Figure 14 shows that new
149 houses have been built near the sites of the old ones but sometimes nearer the road - all
487 but four houses have easy access to the road. Crowlista is linked to the main road by
488 two miles of rough gravel side-road, and by a footpath and ford to Timsgarry. Vans call
362 but there is no Post Office, store nor bus service. At present water supplies are poor -
362 two wells only are in use.

Carnish is served by a short unmetalled road and all houses have good access to this. Water
512 supply is good; water may be stored on the high part of the crofts and piped into the houses. The roads serving Timsgarry too, are unmetalled, but the main road is less than a mile away. This 'main road' from western Uig to Stornoway runs through Ardroil and all
366 except one of the houses not near to it have good drives suitable for lorries. Ardroil has
485 a store and Timsgarry a Post Office. One butcher's and two grocers' vans call weekly
485 and the travelling bank fortnightly. The thrice-weekly bus service to Stornoway (return
488 fare almost £1) ceased in 1960 because of competition from privately owned vans and cars.

241 The cultivated land is in strips usually large enough for horse or tractor work; the
241 smaller potato patches are hand dug. Few horses are kept now, Timsgarry, Ardroil, and
233 Carnish have one each and Crowlista none. Crofters hire these horses or tractors from
467 Brenish or Enaclete. Oats and potatoes are the only crops grown in quantity, small patches of turnips are found and most crofters grow root vegetables. Kale was seen growing on one Ardroil croft; this was an experiment and seemed to be very successful. Bere and rye are no longer grown. Grass mixtures are sown in order to qualify for cultivation grants. Oats are undersown, or grass seed may be sown after the oat harvest, and left for hay for several years - some sown twelve years age was said still to be giving very good hay, but on the whole very little grass is sown in Crowlista. The acreage of natural grass cut for hay varies a good deal with the weather and the time and labour available. Crofters find this difficult to estimate as well, as often small irregularly shaped pieces are cut, and the figures, therefore, may not be accurate. (Appendix A).

One excellent garden showed that a rich variety of vegetables, fruit and flowers can be grown if adequate shelter is provided and the time for cultivation is available, but few crofters have the necessary knowledge or interest.

242 Lime, dung and artificial manure are widely used, though on some Crowlista crofts
134 the compound fertilizer was seen in use for the first time in 1959. Shell sand is used on the
134 crofts which have peaty soil. Although it is agreed that seaweed and dung are the ideal
224 fertilisers for potatoes, seaweed is only occasionally used. It is becoming difficult to obtain locally and much heavy work is involved.

231 Each of the thirty-five operative units which carry any stock at all has a cow for domestic milk supply and manure. If the family is large or many visiting relations stay on the croft during the summer the calf has to be sold early; otherwise it will be reared until the cattle sales in September or in May. Only eight crofters had two cows; fifty years ago four were commonly kept. Only thirteen of the units had young cattle other than calves. One crofter was rearing a kid for milk.

The bull supplied for these townships and Mangersta is an Aberdeen Angus which is wintered on the Ardroil machair.

233 It was sometimes difficult to obtain factual information about sheep and it is difficult to generalise. Operative units without sheep were those where no suitable labour was available. In a few cases crofters considered that sheep were 'not worth the trouble' - but others were building up their sheep stocks. Individual flocks ranged from ten to two

511 It is obvious that crofting no longer affords a livelihood in Aird; the only two families
465 without ancillary occupations are those where all the members are elderly. Of the others
268 with members in the working age-groups, five have one or more members employed in a civilian capacity at the R.A.F. station and there are five regular weavers.

621 Aird used to be a self-contained community; the land was fully cultivated and a certain
178 amount of fishing was carried on in spite of the difficulty of drawing up the boats over the rocky beach. Now it is prosperous, but very much dependent on the R.A.F. station, and if this should ever close down, most of the younger people would have to leave in search of other employment.

CHAPTER SEVEN

VALTOS, KNEEP AND REEF

by

David G. Symes.

131 On the eastern side of the Aird peninsula, facing east to Loch Roag is a secondary
133 peninsula of more moderate, but none-the-less broken relief. This, together with an adjacent area of the main peninsula, the islands of Pabay, Vacsay, Vuia Mor and several smaller islands, comprises the territorial limits of the townships of Valtos, Kneep and Reef.

133 This secondary peninsula is accidented in the extreme, with outcrops of bare rock and steeply angled small hills. The relief is greater in the west (summit 450') than in the east (summit 275'). Relatively level land is to be found only on the machairs of Reef and
133 Cliff (the latter only poorly developed) and on the glebe at Uigean. The Reef machair,
134 about 180 acres, consists of a succession landwards of tidal sands, a belt of sand dunes (c. 20' O.D.) and a sandy plain sloping gently inland towards a reed filled lagoon. The machair at Cliff is approximately 40 acres in extent; here there are fixed dunes and, in addition, the sand has been blown inland to at least 100 ft. O.D. Except where the machair sand has drifted upslope to produce a "brown machair" of mixed sand and peat, the thin soils of the Valtos peninsula are predominantly peaty. Although the length of the peninsula faces north the extremes of Atlantic weather are moderated by the protection afforded by the Aird peninsula and the islands of Pabay and Vacsay.

175 In the period before the lotting of crofts the whole peninsula was occupied by some five
424 clachans - Valtos, Cliff, Kneep, Uigean and Reef - some of which shared common pastures.
361 During the early part of the nineteenth century and earlier, apparently, than the 1850 lotting
620 carried out in most of Lewis, crofts were allotted in each of the clachan areas: Valtos and Cliff shared a common pasture and so became one township; similarly Kneep and Uigean were combined.

175 In Kneep it seems that the croft boundaries were not accepted by the crofters. Certain
311 basic divisions between groups of crofts (usually three in number) are discernable today,
427 and within these basic divisions a certain regularity of distribution of strips persists, but

CHAPTER EIGHT

LITTLE LOCH ROAG DISTRICT

(Meavaig, Caryshader, Ungshader, Geshader, Enaclete and Gisla).

by

Annie Heawood.

133 Little Loch Roag is a narrow sea loch extending southwards about twelve miles i
133 from Loch Roag proper. It has been formed by glacial erosion picking out one of the
134 n.n.e. to s.s.w. lines of weakness characteristic of the Lewisian gneiss. Although generally steep-sided, recent glaciation left much ground moraine and this material, preserved on the less steep slopes, provides arable land for several small townsh or near its western shores. The eastern shore is the more rugged and although a fe small townships once existed there is now only the small farm and shooting lodge of Scalascro. At the head of the loch is an estate cottage for Morsgail Lodge which is a large mansion with extensive fishing and shooting rights, grandly isolated about a mi inland from the main road.

361 The district here described includes Gisla, near the head of Little Loch Roag, En
139 Ungshader, and Geshader, on the western shores of Loch Roag proper. All these a
365 strung out on or close to the main road. Meavaig, like Gisla, is a small farm but al functions as something of a metropolis for south Uig: it has the post-master, whose functions include registrar and receiver of wrecks it has two churches, a telephone c change, the district doctor and manse, and a petrol pump. At the time of our visit t was also the base for the 'bus service. Its metropolitan functions arose in the days the road replaced a ferry boat service from Callanish; here the mails were landed some date in the 1920s, and here, too, the estate kept coach and horses for transport Uig lodge, three miles further west.

361 There is no record of the original settlement of the four crofting townships, nor
365 Gisla, which was a township (or 'joint farm') of five crofters until about 1850. Some
139 modern houses and bungalows have been built, many with easier access to the road th the old black houses, now often used as byres. Water supply does not seem to pres serious problem because of the extensive moorland gathering grounds to the west, bu are not at present any water-supply schemes. Electricity is, of course, available. Caryshader and Enaclete are on the main Stornoway road being served at present by 'bus and by vans selling meat, groceries and fish at least once a week. Enaclete is sub-post-office. Geshader is less fortunate since, although vans call regularly, 'bu must be met at the junction of the unsurfaced track and the main Stornoway road, whe the school serving this district also stands. The track has been extended in recent so that it now reaches all the houses. Ungshader, however, is smaller and although has had similar delivery arrangements, it is now a dying settlement largely due to its inaccessibility.

The crofts are mostly regular in shape on the landward side and fenced except wh
427 the land is very broken as in northern Enaclete. In Caryshader there are fourteen l
632 crofts which at present are worked as eleven units; one is used only as a holiday hom
311 by its owner-occupier and there is one squatter on the common grazing. In Geshade there are eleven crofts, each worked independantly; Ungshader has four crofts but th

137
134

blows away, no doubt because the humus rots and quite fails to bind the sand. These two types together form the true machar.

(*c*) From the machar rise the slopes of drift-covered rock which bear a top dressing of blown shell fragments, more or less mixed with the soil by treading and cultivation, and imperceptibly giving place to the undiluted 'black soils' of moor and croft with their corresponding vegetation or crops. The shell-sand is often blown onto the rough pastures high above a bay.

Where a portion of the true machar has been cultivated it is allowed to seed itself. A sprinkling of weeds is followed by the re-establishment of a mixed flora. In both the sand and the consolidated sand-covered drift grow wild white clover and vetches; and among the grasses are rye grass (*Lolium*), Yorkshire fog (*Holcus*), cat's-tail (*Phleum*) and meadow grass (*Poa*). Other plants include familiar weeds and wild-flowers like yarrow, cow-parsnip, golden rod (*Solidago*), silverweed, wild carrot, thyme, plantain, sorrel, yellow rattle, harebell, eyebright, pansy and many more. Arrival from the bare brown moorland to the sand-blown slopes or dells is made a pleasure by stream-side flowers like meadow-sweet.

137
311

Woods and Cultivation.—In addition to the woods indicated on the map, in Stornoway Castle policies, shelter-belts or plantations occur at certain lodges. Cultivation, as will be explained in the section on crofting, is rarely continuous; and the map shows areas as cultivated which are far from being either continuous crop land or
[185] even permanent grass of the first quality. Yet since this map was drawn the improved area has been extended somewhat

i [see map on p. 50--analyst]

[Ebbos]

Of the 53 residents, 19 are over 65 and only 3 under 15 years, leaving a working population of 29: areas are in permanent employment elsewhere. The population has been steadily declining since its peak of 121 in 1901.

Since 1944, the township has changed considerably. It has been completely leased and the method of cultivation changed from crofting and horse-drawn tractor and implements to modern farming. A further fence has been erected for a lamb park and much land has been reclaimed. Sheep-rearing area has been put down to ley, and the cultivation of potatoes and turnips has ceased to be important. Because of the place of the odar crofters: when working units become larger and stock decreases in a figure equal to the rent carrying capacity of the holding, the crofter's craft could be regarded as profitable concern: at the moment, the croft is only maintained through grants and ancillary earnings. Should that happen, however, there must be more re-seeding and an increase of cultivation to provide winter fodder.

KERSHADER

Helen Mackenzie

Kershader is a township of forty-three permanent residents on thirteen crofts, which stretch for a mile along the southern shore of Loch Erisort. The crofts extend up to one-third of a mile from the coast with a two-and-half mile deep hinterland of rough grazing, which rises from an elevation of 270 feet and the average from 125 feet to 175 feet, but the crofts, mostly arranged in rectangular strips at right angles to the coast, are lower (between 50 and 100 feet) and include three main zones (Fig. 5):

(a) From the low cliffs of the shore to the road, approximately, a narrow strip varying below 50 feet, dissected by four rejuvenated valleys. The soils of the greater part of this zone have a distinctive profile and tend to be moderately heavy, wet, and cold: a typical Hamnavoe profile, which explains the fact that it is almost entirely under cultivation.

(b) A zone between 50 feet and 75 feet with little rising to over 100 feet. The lower areas have varied soils, easily fertilised, and intermediate in type between those of (a) and (b), with peaty-loam characteristics appearing in the higher areas. The higher areas have thinner soils of the same kind with poor grassy pasture; in places there are signs of former cultivation.

(c) A zone of hollows with deep moss soils requiring intensive drainage and reacting well to heavy fertilisation with seaware and intersecting heights covered with blanket bog, partly stained, heather and grass. This zone passes into the common grazing.

Crofts 10, 11 and 12, irregular in disposition, have a steep slope in the south with greater slopes over 50 feet; crofts 2 to 8, steep slopes in parts of zone (b), and crofts 1 and 9, again of irregular shape, are intermediate (Fig. 5).

In Kershader, there are thirteen legal crofts and twelve operative units. The crofts vary between 4.4 and 18 acres, with a maximum of 3 acres reputed arable. In all, there are 23.45 acres reputed arable and 110.25 acres meadow. 24.5 acres are in fact under crop (note 18.5, potatoes 6.5), and 5.5 acres under sown grass: and of the remaining 99.5 acres, mainly natural grass

[Garyvard] [Cravesta]

At the moment Garyvard appears to be a greenhead village, carrying out communal schemes which will benefit the township as a whole. However, the age structure of the population is abnormal (over 60 per cent of the population is over 45 years. The future in Garyvard offers young people hard work, little money and no entertainment, making the attractions of the cities and industries of the mainland quite irresistible. Unless some means can be found to make the future look fit for the area, since most crofters are of the opinion that a weekly wage packet would more than compensate the loss of their independence. Perhaps it is symptomatic of the age of Garyvard that the crofters and adventies that man caves more for momentary rewards and the luxuries of life. This is well understood by parents who encourage their children to leave the islands to seek employment either in the cities or in the mainland. The Lewismen's co-ordination of sheep-farming and crofting and a way of life. His present desire keen to see the township prosper and to see the young people who would make good crofters and farmers, but he realises that it is not in accordance with modern ideas and purposes. Unless prosperity can be brought in by way of industry, tourism or increased croft efficiency, possibly through co-operation in working and marketing, it is doubtful if it is possible that we are witnessing the end of a township.

CAVERSTA

Helen Mackenzie

Caversta lies along a southern inlet of Loch Erisort, five miles from the Minch and is partially sheltered from east winds by the Cromore peninsula and Eilean Chaisim Chille.

The physical nature of the township is irregular, rising steeply from the water's edge to a level of approximately 100 feet, with a few areas of flat land at the foot of the steep slopes: and it is here that the settlement occurs. Apart from the shore, the highest points in the township are at 400 feet and are visible at 75 feet and 100 feet above the loch, which is here bordered by a 25 foot rock face. The resulting slopes are separated by faces of bare rock. The soil is mainly peaty, but there is a noteworthy feature. Below a small lock, the river follows an irregular course through a wide and shallow meandering depression in a gravelly deposit, and at one has an appreciable area of level land unencroached by rock outcrops. Bells, derived from glacial drift, are unevenly distributed, thin, and very stony, and cultivable areas are thus small and widely separated.

The surrounding hills, which form part of the eight hundred and sixty-three acres of common grazing, are mainly covered with heather, rough grass and moss, while the lower areas within the township are greener, but drainage is poor, and rushes are widespread. Bracken is not yet a problem, and there is little scrub except on the Cromore side, where there is a portion of last year's crop. A few rowans and willows survive here also, but otherwise the area is devoid of cover.

There are twenty-four registered crofts in Caversta, twenty-two being inhabited, one vacant and one occupied by a non-crofter. Crofts are arranged in two rectangular blocks, with the exception of two crofts, one of which is on the common, all the boundaries run from the township dyke, which closely follows the two hundred foot contour, to the sea in a radial fashion (Fig. 5). The size of the crofts varies from 1.25 acres to 22.25 acres but only seven crofts and less than four or more than eight acres in size. No croft has more than three acres of land which has ever been cultivated, and few now cultivate more than one acre. There are thirteen cottars and squatters, five houses being on the common, three of them cultivating small areas adjacent to their houses.

Cultivation is exclusively by spade on the 'lazy-bed' system. Owing to the rocky nature of the terrain, the 'lazy-beds' are narrow, often only one or two spits wide. Potatoes and oats are grown in rotation, and hay about from lazy beds left fallow. Very few crofters sow grass for hay and permanent pasture, most of the lazy-beds being left fallow. Crofters use seaware and farmyard manure as the most general 'artificial'. Small enclosed gardens, often somewhat neglected, produce lettuce, carrots, cabbage and soft fruits on about half the crofts, but no garden produce is marketed.

[Cromore]

The 1914-18 war had a marked effect on the Cuveasta population - 16 out of 54 (29 per cent) left after 1911 and no reproduction took place. Since 1929, seven people have emigrated to the village Stornoway four years ago and the inhabitants now look forward to a supply of piped water in about two years' time. At present only three or four houses have bathrooms.

The crofts, when worked well, are good enough to provide the existing population with a satisfactory subsistence, but each family unit must have some additional source of income. It seems that the current emigration from the Cromore area is likely to attract fishermen from Cromore and one or two boats might be sent out from the bay if the quay were longer. Weaving has brought prosperity but, as the Park Commissioner states in his Second Progress Report, it has not sufficient weaving available for the present number of weavers'. The proposal to establish a spinning and processing mill in the Park District seems to be the most practical solution to the problem, and it would be a great boon to the people of Cromore. The village is sited in a most picturesque spot and one of the inhabitants suggested that a mini-bus, with the Park Hotel, Stornoway, as the terminus, would pay. However, even if these three increased earnings of a generation became effective, one wonders whether they would be sufficient to attract the younger generation, already urbanised by schooldays spent in Stornoway.

MARIVIG

Pamela Gough, B.A.

Marivig is situated on the western and south-eastern sides of Loch Marivig, a small triangular sea loch opening to the north-east and sheltered from storms and swells by Torray Island, making it a safe and sheltered anchorage.

The land rises steeply from the shore of the loch for twenty-five feet to fifty feet, then slopes more gradually and irregularly, with frequent precipitous rock outcrops, for two hundred to three hundred and fifty feet, when it levels off to a fairly extensive area of low hillock, rising to three hundred feet high, surrounding the loch. All crofts then have an easterly or north-easterly aspect, not particularly favourable for agriculture, and no one has any appreciable area of level land unencroached by rock outcrops. Soils, derived from glacial drift, are unevenly distributed, thin, and very stony, and cultivable areas are thus small and widely separated.

The surrounding hills, which form part of the eight hundred and sixty-three acres of common grazing, are mainly covered with heather, rough grass and moss, while the lower areas within the township are greener, but drainage is poor, and rushes are widespread. Bracken is not yet a problem, and there is little scrub except on the Cromore side, where there is a portion of last year's crop. A few rowans and willows survive here also, but otherwise the area is devoid of cover.

There are twenty-four registered crofts in Marivig, twenty-two being inhabited, one vacant and one occupied by a non-crofter. Crofts are arranged in two rectangular blocks, with the exception of two crofts, one of which is on the common, all the boundaries run from the township dyke, which closely follows the two hundred foot contour, to the sea in a radial fashion (Fig. 5). The size of the crofts varies from 1.25 acres to 22.25 acres but only seven crofts and less than four or more than eight acres in size. No croft has more than three acres of land which has ever been cultivated, and few now cultivate more than one acre. There are thirteen cottars and squatters, five houses being on the common, three of them cultivating small areas adjacent to their houses.

Cultivation is exclusively by spade on the 'lazy-bed' system. Owing to the rocky nature of the terrain, the 'lazy-beds' are narrow, often only one or two spits wide. Potatoes and oats are grown in rotation, and hay about from lazy beds left fallow. Very few crofters sow grass for hay and permanent pasture, most of the lazy-beds being left fallow. Crofters use seaware and farmyard manure as the most general 'artificial'. Small enclosed gardens, often somewhat neglected, produce lettuce, carrots, cabbage and soft fruits on about half the crofts, but no garden produce is marketed.

[Bertrig] [Ceilbost]

In conclusion, it may be said that the problem of Martigh's future, and that of other crofting townships, is not only one of adverse aspect, and a shortage of capital, and of distance from markets, but a problem of the maintenance of a viable and stable level where agricultural ends are large enough to encourage the entire and non-crofting section of the population to remain, and a problem of finding capital to equip a modern fishing fleet.

CALBOST

Anne Cooper

The crofts, when worked well, are good enough to provide the existing population with a satisfactory subsistence, but each family unit must have some additional source of income. It seems that the current emigration from the Calbost area is likely to attract fishermen from Cromore and one or two boats might be sent out from the bay if the quay were longer. Weaving has brought prosperity but, as the Park Commissioner states in his Second Progress Report, it has not sufficient weaving available for the present number of weavers'. The proposal to establish a spinning and processing mill in the Park District seems to be the most practical solution to the problem, and it would be a great boon to the people of Cromore. The village is sited in a most picturesque spot and one of the inhabitants suggested that a mini-bus, with the Park Hotel, Stornoway, as the terminus, would pay. However, even if these three increased earnings of a generation became effective, one wonders whether they would be sufficient to attract the younger generation, already urbanised by schooldays spent in Stornoway.

[Grevrig] [Simegrevig] [Lemeway]

The organ used in Grevrig is a reduction in the number of holdings. A pro-requisite of such an development would be a stable and non-crofting population of sufficient numbers to support shopping and other facilities are the more obvious occupations; the former is subject to world trade fluctuations but the latter is now in a more favourable position since the introduction of the herring fishing guaranteed subsidy, although the raising of the initial capital for buying net equipping boats is a formidable problem. It is clear that a division of the community into a crofting and non-crofting sector is essential if the present population level is to be maintained. The most serious aspect of the present situation is the fact that the migration from the township is mainly confined to the younger people. Unless holdings of economic size can be formed, and stable employment introduced, one can expect the younger men and women to continue to leave Grevrig.

Until a major reorganisation of the crofts is carried out, a vigorous attempt to re-seed large areas of the common pasture and the three lochs in Grevrig, and the development of a crofting-cum-fishing industry, is a matter of urgency. It is not sufficiently realised in crofting districts that the capacity of much of the moorland. Brachan has established itself in such a way that it is neglected by the crofters and farmers.

Grimsay is unique in Park, for the present township is entirely a twentieth century development in the early 19th century there was a settlement at the head of the loch, but in 1843 the residents were removed and the area sold to Colin Mackenzie of Cromba, Stornoway. In 1919, there was a proposal to establish fourteen crofts, but the applicants were requested to wait until after the war. At the end of the war the number of applicants had increased to twenty-four, and in 1921 a grant was made in Lemeway. Several of them 'related' the Grimsay area. At first living in huts, they built their own houses and, with the assistance of the Department of Agriculture, they cultivated and fencing off lowland legal crofts, and at the same time providing a good footpath. Being the success of their neighbours, the Park District Committee, in 1924, created a further 24 crofts in Stornoway, about a mile to the west of Grimsay. Here, however, the Department of Agriculture did not intervene and the crofters were left to their own devices, some of the crofters in Lemeway visiting Grimsay year, although one family remained until 1939.

Of the 24 crofts in Grimsay, 20 are occupied by non-crofters, six have between one and fifteen acres, while the remaining two occupy eighteen and twenty-five acres: the largest croft originally belonged to the landowner on the sheep farm. Three of these crofts are unoccupied, although worked by other crofters, with the result that eleven operative units share 161 acres.

Only a small part of the croft acreage is actually cultivated in practice. Its cultivation and rotation are similar to that of the other crofting townships, with the exception that allowance must be made for the fact that the crofters are unoccupied, although worked by other crofters, with the result that eleven operative units share 161 acres.

The township consists of three distinct areas. A flat, poorly drained area at about 100 feet, part common pasture and part reclaimed as extensions to the croft, locally known as the 'Ceiteed', forms the centre of the township. The crofts are mainly arranged in two rectangular blocks, which are separated by a steep slope to an altitude of 400 feet, less than half a mile from the loch shore, forming the hinterland. Two hundred and fifty feet above the loch shore, a second area of level land occurs, which occur at the same height to the north. It is suggested that the flat area is the result of a former lowland loch, and that the hinterland represents the shore of the loch, and partly ice-eroded rock exposures. A channel eroded through this sector allows the lake to empty, the northwards leaving a relatively deeply incised valley through which the present stream flows to the sea.

Soils may be divided into two types - a peaty loam and the better drained gravelly loam which is found to the east and west of the township and also the main stream. In later is the only cultivable soil.

The township dyke is very close to the settlement and in the past sheilings were not an widely used in Calbost as elsewhere. The cattle were instead brought near to the dyke for milking and allowed to graze on the common unattended. There are no ruins of sheilings to be found on the hills around Calbost but a more interesting feature of the past is the cattle dyke: enclosures were made adjoining the main dyke and in the late summer the cattle were brought to fresh pasture within these dykes before the opening of the township gates. Following the opening of the gates the stock are free to wander over all crofts but the common today to be a more towards the complete exclusion of the crofts.

[Britaisg]

which rises steeply, exceeding 375 feet in the west and 150 feet to the north and east. From the south-east and north-east two glacial drift-filled valleys drain southwards, their lower ends being "drowned" by neotheneet extensions of the sea.

Although peat cover most of the surface it is only in the hollows that it is significantly deep. The common sheep grazing the peat cover is frequently so thin as to expose a layer of morainic sub-soil containing many stones and boulders.

Two rowans and a dozen willows represent the single crop, but tree stumps frequently occur in the peat, and it is evident that woodland was formerly more extent. Whether this former woodland disappearance was due to climatic or climatic change it is not possible to say, but it is certain that a century of overgrazing has not been sufficient to prevent the growth of woodland, and the fact that the sheep are kept off the hill during the lambing season, and the development of a crofting capacity of much of the moorland. Brachan has established itself in such a way that it is neglected by the crofters and farmers.

Grimsay is unique in Park, for the present township is entirely a twentieth century development in the early 19th century there was a settlement at the head of the loch, but in 1843 the residents were removed and the area sold to Colin Mackenzie of Cromba, Stornoway. In 1919, there was a proposal to establish fourteen crofts, but the applicants were requested to wait until after the war. At the end of the war the number of applicants had increased to twenty-four, and in 1921 a grant was made in Lemeway. Several of them 'related' the Grimsay area. At first living in huts, they built their own houses and, with the assistance of the Department of Agriculture, they cultivated and fencing off lowland legal crofts, and at the same time providing a good footpath. Being the success of their neighbours, the Park District Committee, in 1924, created a further 24 crofts in Stornoway, about a mile to the west of Grimsay. Here, however, the Department of Agriculture did not intervene and the crofters were left to their own devices, some of the crofters in Lemeway visiting Grimsay year, although one family remained until 1939.

Of the 24 crofts in Grimsay, 20 are occupied by non-crofters, six have between one and fifteen acres, while the remaining two occupy eighteen and twenty-five acres: the largest croft originally belonged to the landowner on the sheep farm. Three of these crofts are unoccupied, although worked by other crofters, with the result that eleven operative units share 161 acres.

Only a small part of the croft acreage is actually cultivated in practice. Its cultivation and rotation are similar to that of the other crofting townships, with the exception that allowance must be made for the fact that the crofters are unoccupied, although worked by other crofters, with the result that eleven operative units share 161 acres.

Oats and potatoes are the single crops, occupying 9 and 8½ acres respectively in 1958. Individual acreages of these crops vary in relation to the requirements, for winter stock-feed, and in the case of potatoes, to demand and marketing considerations. Potatoes are grown twice every three years, of course, careful preparation. A plentiful supply of seaweed is obtained from the shore and in the case of the frequently used fertilisers, which a little supplies of ammonia is applied. Only two crofters are idle.

In the last two decades a marked reduction in the amount of oats grown has accompanied a decrease in the numbers of cattle and an increasing use of hay for fodder. Nevertheless only about 175 acres of hay altogether are cut, and only five of the crofters are any grass seed.

In August 1958, the township supported only 13 cows, 2 young beasts and 6 calves. Half of the crofters have a cow and a calf, but three have no cattle at all, and one also sold seaweed. Milk, and commercially on the sale of crofting in Grimsay, but predominantly on means uneconomic in crofting areas.

133 North of a line between Lochs Sligichan and Eynort, Skye
is a typical basalt plateau. Generally, it is a low-lying
region of deep glens, rolling moors, and small hills. Mountain-
ous terrain is encountered only in Trotternish and Duirinish.
In Trotternish the land has faulted and uplifted to produce a
long ridge of cliffs which rise to 2,360 feet. The uplands of
Duirinish culminate in MacLeod's Tables, a pair of flat topped
• 134 hills (1,601 and 1,538 feet). This basalt area is Skye's best
agricultural asset. The rock easily breaks down to form a po-
tentially rich, light loam and the porosity of the basalt fa-
cilitates drainage.[2] Unfortunately, the potentials are not
133 always immediately available. The heavy rainfall and configuration
of the land prevents the accumulation of deep soils. In addition
to shallowness, the marked common characteristics are lime,
phosphate, and cobalt deficiencies, acidity, heavy leaching,
and water logging. An extensive, irregular overlie of peat is
a further restricting factor. Except for the western slope of
the hill ridge of Trotternish and, to a lesser degree, some
parts of Duirinish, blanket bogs of peat will not allow the
basic nutrients of the underlying soil to be brought into circu-
lation. There are, of course, raised beaches and well drained
terraces throughout the area with relatively good grable land.
The relative fertility of northern Trotternish has been recog-
nized for many centuries. It has long been known as "the
Granary of Skye."

[2]Darling, op. cit.

133 South of the basalt plateau, the Cuillins and the Red
134 Hills have intruded into the lava. Although the Cuillins
dominate the landscape for many miles, they are absolutely
133 useless agriculturally. Indeed, a case might be made for the
derivation of the name Cuillin from the Welsh gwylin (worth-
less).[3] The worthlessness of the mountains in the local
economy is attested by the fact that they are the only mountains
in Scotland with peaks named after men, all of them mountain
133 climbers of the last century.[4] At the same time, however,
134 they have become a valuable asset in the tourist trade.[5] The
Red Hills rise to 2,537 feet. They are mostly covered with
screes and skeletal soils, but they have some pastoral value.
All have traditional Gaelic names.

133 Below the mountainous region a broad limestone valley
extends across the island from Broadford Bay to Lochs Eishort
and Slapin. Like northern Skye, it is a gently rolling region
• 135 with few rises which exceed 500 feet in elevation. The po-
tentially good soil is frequently masked by a heavy overlie of
peat.

Sleat, the southernmost peninsula, reveals a compli-
[134] cated structure, a complex of ancient rocks and moraine.[6]

[3]R.N. Humble, The Cuillin of Skye (London: Robert Hale, 1952), pp. 3-4.

[4]Ibid., p. xv.

[5]W. Puscher, The Magic of Skye (London: Chapman and Hall, 1949); F. G. Meadows, The Skye Scene (Edinburgh: Oliver and Boyd, 1951)) and Humble, Op. Cit., pp. 31-106.

[6]Darling, op. cit., pp. 28-29.

133 The northeastern end of the peninsula is covered by glaciated,
• 135 rounded hills rising to 2,396 feet. The remainder is a low-
lying area of soft rises and deep glens. The soil cover is
largely no more than a physical zedium. Were it not for stoney
but light, well drained soils on several raised beaches and
morainic soils derived from the mainland, large parts of
Sleat would have no cover other than ice scoured rock. Peat
covers many of the flatter facets.

133 Despite the multiformity of the physical appearance
of the island, one cannot help forming the impression of a
135 certain sameness. Except where bare rock stands out in stark
relief or where man has laboriously turned the soil to agri-
cultural use, the flora of Skye is primarily grass only
occasionally interspersed with a few trees. In the glens
and on the lower slopes of the hills fescue and bent grasses
134 are found wherever the natural drainage is good. Both are
tender and excellent for pasture. Poorly drained land supports
coarse sedges and rushes. Above 300 feet moorgrass is found
on dry facets and rushes and mosses on soggy ground. The high
hills, such as the ridge of Trotternish, maintain a sub-alpine
pasture of small flowers, mosses, and sparse grass. Obviously,
the main factors governing the natural flora are drainage and
134 altitude. Man and his stock have also influenced the vegetation.
Selective grazing by sheep has allowed the spread of a large,
tough fern, called bracken, which has markedly reduced the
135 pastoral value of extensive tracts of the best land. Another
common plant is heather. True heather moors, however, are
136 considered plantable in in limited, isolated patches. At this

3/3 133 Just outside of Portree was taken -vsrin 1953, and there are
plans for acquiring additional blocks of land.

One reason for the optimism surrounding the potential
benefits of forestry to the Highlands is the growth of population
which it apparently stimulates. In Glen Brittle the local
school, closed for many years, has been reopened. But, as
in all migration schemes, the average age tends to be low,
and, consequently, procreation is to be expected. Whether or
not the potential benefits will be realized remains to be
seen. Decidedly in favor of forestry is the stable employment
which is offered. Further, a man can be allowed time to carry
on crofting not only in his spare time but also full-time
when seasonal demands require his full attention. Whether or
not there will be enough land left for pastoral-agriculture,
near the plantations if he wants to take the time, is another
question. Then, too, there are natural limitations to the
extension of forests.

3/3 The difficulties to be faced by forestry on Skye may be
• 134 briefly summarized. Above all, conditions for tree growth are
132 far from ideal over much of the island. If the soil is fertile
enough for trees, as in Glendale and Kilmuir, exposure to the
south and west winds may be too severe for a plantation. Shelter
belts might be planted, but they have no commercial value and
offer only fleeting employment. If there is shelter from the
wind, as in Sleat, the soil is either too poor or too boggy
for commercial operations. Beyond the areas already acquired
and the few small plantations on private estates, the land

1 INTRODUCTION

131 THOUGH generally referred to as separate islands, Harris
and Lewis are geographically speaking one island—the
largest landmass in the Outer Hebrides. Its latitude is
approximately 57° 40' to 58° 40' N; its longitude 6° to 7° W.
Many have expressed surprise at the size of the island, which is
over 800 square miles in extent. From top to bottom the crow's-
flight distance is just over 80 miles, and from east to west about
14 miles. By road, however, the north-south journey (the Butt of
Lewis to Rodel in Harris) is a good 80 miles. And by road from
east to west (Tiumpan Head lighthouse to Breinish in Uig) is
54 miles.

132 Among the oldest islands of the world Harris and Lewis is
• 135 founded, like a strong resisting house, on rock, on gneiss said to be
the oldest fragment of Europe. From a distance the tough durable
Lewisian gneiss is easily recognisable as bare, barren, elongated
domes and ridges, giving a hummocky appearance to the land-
scape. Among other rock types to be found is a patch of a few
hundred acres of granite in the parish of Barvas, on the west side
of Lewis; some torridonian sandstone showing on each side of
Broad Bay, around Stornoway; and the tertiary basalt of the
Shiant Isles. These latter islands, pin-points of high land, are geo-
logically speaking insular outliers of Skye, though they are but a
few miles or so off the Lewis coastline. Another set of islands,
associated with Harris and Lewis, are the St Kildas, composed
of gabbros and basalt.

The continual exposure of the rocks on the island makes it easy
for those interested in geology to see just what happened those
countless years ago. Sands, muds and limestones were formed in
an ancient sea, to be later heated and recrystallised as volcanic
eruptions occurred. During this boiling, a seasoning touch of
molten granite was added. Later, still in an ancient season, the
rocks were thrust up and crushed against each other to form
today's geological spectacular. Dark-coloured hornebleude and

INTRODUCTION

133 mica-sparkled gneiss show the intense shearing. And crushed rock
• 135 known as flinty crush because it splinters so easily, adds another
sight for the modern eye. The Stornoway beds, as they are called
are broadly known as torridonian sandstone, old red sandstone
or triassic; some geologists regard them as part of the pre-Cam
brian torridonian series.

133 From geological evidence, twice did vast icesheets move over
the rock-faces to round off the sharp corners of the island. And
as individually then as now, geologists think that there may have
been a third small glaciation—a private Hebridean one. Today
the scenery bears the imprint of glacial striae or scratchings
Polished rocks show scores; lochs are gravel-dammed, and ther
are countless small lochans and tarns formed from deep gouging
in solid rock. There is some evidence too of a depression or land
sinking during a much later post-glacial time. Many times have
fishermen found, far below the present high-water line, stumps o
trees and buried submarine peat, the wasting remains of forme
land vegetation. Martin Martin, who wrote of the Western Isle
• 105 about 1695, said of Berneray, one of the small islands in th
133 Sound of Harris: 'The west end of this island which looks to S
Kilda, is called the wooden harbour, because the sands at low wate
discover several trees that have formerly grown there. Sir Norma
MacLeod told me that he had seen a tree cut there, which wa
afterwards made into a harrow.' These vegetation remains indicat
[134] a former fertility. Volcanic action and deposit, the makings o
good soil were, however, largely carried away by glacial move
ment to leave a thin scraping of boulder clay clinging to the ba
rock for dear life.

133 Lewis is largely rolling moorn of blanket peat with many loc
and rivers. To the west of Lewis, in Uig, high hills begin to rai
the eye. In North Harris, the hills are higher, reaching their poi
in the Clahaim (2,622 ft above sea level). These are not strict
speaking mountains. But they do present not a few problems
climbers, having some formidable rock-faces; and on the seawar
side are virtually unscaleable cliffs. Much of the ice-monoto
[135] landscape of South Harris is rocky and barren, gneiss outcrop
[137] cover many acres in places, and are almost completely devoid
any kind of vegetation, except where, in the odd crevice, like bi

CHAPTER ELEVEN

THE CARLOWAY DISTRICT

by

Brian Loughbrough

131 133 103 The seven crofting townships of Upper Carloway, (including Carloway Park), Borrowston, Garenin, Knock Carloway, Dun Carloway and Kirivick form a compact area of land in the north of the Parish of Uig bordering the coast and Loch Carloway. Here the Lewisian gneiss has a thin discontinuous covering of glacial drift which is most extensively developed immediately above the head of Loch Carloway. Three valleys help to determine the layout of the townships and settlements (figure 37). The townships to the north-
361 133 west of the Carloway river are found on more gentle slopes than those to the south east where the slopes are less uniform and are less uniform and are often broken by short steep rocky faces. The north western area therefore offers an environment where almost continuous cultivation is possible whereas in the south east the frequent rock outcrops have led to fragmented cultivation on minute plots which are inaccessible to the tractor or other mechanised implements.

131 The soils are heavy and acid even on the skinned land of the boulder clay slopes nor is there any machair to mitigate the acidity of the peaty areas which descend almost to the shores. Only in one place is there any trace of the influence of the sand and this is to be found where the crofts numbered 1 to 3 Garenin border the small bay in the north of that township. Here the fierce gales have blown some of the finer beach deposits on to the croft land.

Much of the peat has been cut from the inner common pastures except in the case of Upper Garloway where active cutting is still taking place in the valley whose flanks are occupied by squatter settlements, to the east of the football pitch. On the common 131 311 pasture the vegetation varies from peat moss and heather with bracken to fescue and close turf on the skinned land by the road to Dalemore. On the upper common pasture heather and bracken have increased since the abandonment of the shielings and the reduction of the cattle stock; many inhabitants remember that the hills once had a much greener aspect. Nor is this a feature confined to the common pastures; on one croft in Upper Carloway 1.9 acres are completely covered by heather whilst a neighbouring croft has a good crop of oats on similar land. At the loch in both Knock and Upper Carloway areas of former arable land have reverted to moss, the old lazy beds being picked out by lines of reeds.

361 Settlement. The settlement pattern is one of great interest for it shows in a clear way the effects of the distrinct phases in the historical geography of the area. The evidence of success and failure stands side by side. Before attempting to justify this assertion it is necessary to give a brief account of the physical evolution and distribution of settlement.

361 175 The origin of permanent settlement is believed * to have been the permanent occupation of shielings used by people from Bernera until the eighteenth century. Until about 1850 arable land was held run-rig and the houses were huddled together in tight little clusters. When individual crofts were lotted, about 1850, the houses werescattered, each on its croft and generally up to fifty yards from the present road (which was then 361 no more than a rough track). Sea access was then most important but since the advent 44 of modern road transport new houses have been built nearer to the roads, producing the 178 modern markedly linear plan. The roads extend at different heights across the slopes

* based on information supplied by Mr Macleod of 27 Garenin.

[NEXT CONTINUED ON PAGE 101]

[Seaforthhead]

161 162 166 167 241 223 652 Table XVII reinforces the idea that there is a striking dichotomy between the agricultural and fishing townships. The former are characterised by a more stable population trend, significantly fewer of the population in permanent employment furth of Park, and a smaller loss by migration. In the fishing townships, where growth and decline have been equally meteoric, there is a larger proportion of persons in permanent employment furth of Park, and migration losses have been greater. It is also significant that there is a smaller natural increase of 0.5 per cent in the agricultural townships. The only township which shows a natural decrease over this period is Calbost, one of the fishing townships.

SEAFORTHHEAD AND SHIELDERNISH

Rachel A. Hirst

131 Seaforthhead and Shieldernish are separated by 4,485 acres of rough grazing, the former lying on the northern shore of Loch Seaforth and the latter on the southern shore of Loch Erisort.

SEAFORTHHEAD

135 361 Seaforthhead, the most isolated of all the Park townships, consists of three crofts and a gamekeeper's holding. The township boundary is situated between the 50 and 75 foot contours which at their furthest extent are only 150 yards from the shore. Immediately behind the road the land rises very steeply in rough uncultivable moorland covered with many boulders but generally below the road the land slopes gently at about 5-10 degrees, in places being [247] completely flat. Here, however, the lazy-beds are very boggy and rushes have appeared in the ten years since cultivation ceased.

134 357 The soils are deep near the shore due to soil creep; higher up they are very thin and peat accumulates to at least 3 feet both below and above the road. There is little cover; bracken is rare, but silverweed and heather, moorland sedges and grasses soon colonise disused lazy-beds.

241 [233] Legally there are three crofts but only one is still cropped, the other two being used solely for grazing. There is, however, a gamekeeper's holding within the township boundary worked as a croft. The other two crofts are used as ancillary grazings to holdings in Airidhvruach and Balallan and have not been lived on for forty years and ten years respectively.

[244] The chief crops are oats and potatoes, though the gamekeeper had a patch of turnips and the other croft had grown them during the last few years until 'finger and toe' developed. [407] Patches, about half an acre in extent, are drained with stone drains and ploughed by tractor, after which potatoes are grown to clean the soil, followed by oats for one year and then sown hay for three to four years. This is not strictly adhered to and several lazy-beds appeared to be [314] in natural hay. There is no peat-cutting on the crofts as peat is secured just outside the township fence on the common pasture. Lambing has been poor for the past two years being [231] only 50 per cent in 1958; the stock carried is twice the sheep soum. The cattle, Highland and Ayrshire or Shorthorn crosses, are below the soum, but previously nine cows and followers have been kept.

161 162 241 178 There has been a great decrease in population and cultivation since the resettlement in 1886. In Seaforthhead and Shieldernish as a whole, there were twelve crofters before the

[Seaforthhead] [Shieldernish] [Habost]

161 162 241 178 suppression of the original townships opposed to six today. As a result, ma given over to natural grass, are being gradually encroached on by heather a of the present population of twenty-three, one is permanently away and two since 1939. There is a more healthy population structure, with a large num between 15 and 44, due to a large family having returned home and six child age.

361 In Seaforthhead and Shieldernish all settlement is below the road and hou [349] slight elevations. At Seaforthhead is the reputed hunting lodge of the Seafor [505] now ruined, but still showing signs of abnormal size and arrangement. Whe [491] communication was by ferry (1820). Now a cart-track, deeply rutted, to El [178] access to the Tarbert-Stornoway road two-and-a-half miles away.

SHIELDERNISH

131 361 232 Shieldernish, also consisting of three crofts, is better situated on the Pe road. The three houses are situated on a well-drained northerly slope, hal road and the shore, but the three crofts are on better land and greater acce better management and new ideas.

241 311 [246] [231] [244] Cultivation in isolated patches reaches up to nearly 100 feet and the lazy together to permit ploughing by horse or tractor. One croft grows neither o preferring to enclose two one-acre parks, re-seed them, cut the hay in June lambs on the aftermath. By next year, this crofter hopes to have enclosed further acre and will then use the three in rotation. The other two crofts gr potatoes and one is also sowing down. The crofts average fourteen acres in gentle slopes are extensive, the major part of the crofts is in permanent pa [226] [288] stocking of the Shieldernish crofts is below the souming. Fishing is now onl though there is a small jetty on No. 1. Part-time weaving is performed crofts.

The future pattern would appear to progress to more grazing and less cu of the six crofts - both at Seaforthhead - are worked from outside the towns isolated township, being difficult of access and having little cultivable land, grazing. Shieldernish appears more suitable for enclosing parks for fatten soils are deeper and slopes gentler, making the use of a tractor feasible. out of the crofts especially with fertilising and re-seeding for hay and pastu [185] fodder crops for wintering. It is hoped to fence the common securely, and renewed - a great necessity. Daily communication with Stornoway also mea is better placed than Seaforthhead for a flourishing settlement. The crofts workable size - provided part-time work, such as weaving, is maintained, grants from the Crofter's Commission.

HABOST

Rachel A Hirst

131 133 241 361 [154] Habost is scattered around a small bay on the south shore of Loch Eriso stretches for over a mile encroaching on three small hills separated by wid valleys which soon rise to the dominating Craigeal (225 feet). Slopes are va flatten out at about 100 feet near the road and on this flat, most of the cultiv Nearer the shore, slopes are much steeper and on the hills there are bare r soils.

[Habost]

134 Drift is found near the shore and laps round the three hills nearly up to the road, predominantly heavy clay with small boulders; this is replaced above the road by peaty loam on rock. At one time, here was grown on the heavy drift. There is peat accumulation on the flat land near the road to a depth of about six feet and there are one or two peat banks.
137 Vegetation is poor; there is no bracken or cover and within the crofts, moorland grasses and sedges predominate on rough land, though there are many lazy-beds sown down to clover and cocks foot. On the hills heather predominates.

195 Habost is the oldest township in Park. In 1843 Maclennan came from Shieldernish and
692 took what are now Nos. 9, 10, 11, 12 and 13 and Ailean Tailear came from Taransay, Harris,
621 to No. 7. By 1886 there were thirteen crofts; in 1907 four cottars were recorded, three being there before 1886; in 1957, No. 11 which had been shared between two brothers since 1906, became legally 11A and 11B making fourteen crofts. There are also fourteen operative units although two are worked from Kershader, both as 'hay and grazing' units, and two are worked as one unit within the township, for there are three non-crofting units.

241 Only sixteen lazy-beds are dug by spade, the rest have been drained with stone drains and
409 ploughed by tractor owned by one crofter who loans it out to Habost and Kershader. There are three 'Croftmasters' (hand-tractors) in the township but these are only heavy enough for
293 bringing in peats, hay and similar light work. The progressive Habost community has fenced off part of the common grazing, to keep the weaned lambs off the croft from August till November and so save fodder for winter when the croft land is open to grazing.

[244] Oats and potatoes alternate in the rotation, with a little sown grass for hay, sown in enclosed
[246] parks of about one acre. The tendency now is to increase the number of parks, cut the hay in
[231] June and build up the lambs on the new grass. Shell-sand is used to fertilise the parks but
[324] elsewhere artificials, such as superphosphates, 'potato manure', potash, nitro-chalk and lime are used in addition to dung and, near the shore, seaweed. Most of the hay is taken from old lazy-beds.

291 The land is heavily overstocked: the soum is equivalent to 79 cow units, and actual stock is
233 144, whilst the figures for sheep are 191 and 618 respectively, including the sheep stocked in
[232] Park Deer Forest by seven of the Habost tenants. Sales of cattle are held at Garyvard in November
[221] and May and sheep and lambs are sold in Stornoway. Lambing was poor in 1958, 50-75 per cent being general, but many breeding ewes and other sheep have died.

241 The only cultivation on the common land belongs to the unofficial holdings. Behind Craigeal, however, there are some old lazy-beds, a well and ruins of a hut, which has not been used since before 1852. There used to be shielings on the far side of the common on Beinn Bhuidhe and
[311] below Loch na Ciste but these have not been used since 1888. Habost is one of the agricultural
[226] townships and fishing is only for domestic use; looms are to be found on only four crofts and
[282] trade is slack. One crofter has a lorry for contracting, carrying peats, fertilisers and stock
[293] to market and two have butcher's rounds in Lochs. There are two small stores.

361 Settlement is scattered, always on elevated ground, and in many cases the new house has
[312] been built in close proximity to the old house site. All have piped water either from the well or
[354] from a rain tank, drinking water being carried in the latter case. Grants from the Crofting Commission are enabling new building and improvements to be carried out.

1/A [See page 17 for explanation of soil zones--Analyst]

Table 30 shews the present use of fertilisers and manure. It will be seen that dung is still widely used but seaware is used in a minority of cases, particularly in Breaclete and Earshader. The first at least may be related to the various troubles that have afflicted the township, and to the fact that several holdings are in effect very small with but plots of cultivation. This also relates to the large number in Breaclete who use no form of fertiliser at all. Shell sand is neglected for reasons of inaccessibility: it is present on Little Bernera, and more particularly and of excellent quality, at Bosta. It is difficult to get from within the Island the large quantities of sand needed to qualify for the lime subsidy; it would be possible to get it from Bosta sands, there is a township road to within about a hundred yards of the beach, but the township is unwilling to open it to the wear and tear of lorry transport.

Artificial fertilisers are increasingly used. The first consideration at the present is undoubtedly that certain amounts have to be applied in order to qualify for the ploughing subsidies. This has overcome a reluctance engendered by early over-enthusiastic applications of sulphate of ammonia. Lime, in the powdered form or as nitro-chalk, is commonly applied. There is undoubtedly considerable ignorance in the application and use of artificials: they are often used only because of subsidy conditions, and the crofter is surprised, though gratified, when they have any practical effect. Certainly most crofters have no programme of their own of regular balanced applications to crop land. They need further advice.

The best balanced fertiliser policies are followed on the reseeded pastures, mainly because the crofters are careful to follow the directions they receive. They will follow advice in these matters when they can get it. In 1959 reseeding had been undertaken by 16 individuals, (20 acres) and by one township (Breaclete). Reseeding has definitely "caught on" as a means of improving the stock carrying capacity of a croft, with comparatively little outlay in labour or machinery. (1) It is, however, a new project: one may wonder whether the crofters will have sufficient pertinacity and funds to continue indefinitely. Reseeding is not cheap; it may cost £18 to £28 an acre and it is reckoned to cost £3 per annum to maintain. A considerable increase in output will have to be evident to make it worth the crofters' while to continue.

The methods of cultivation still include much spade digging, and some crofts depend entirely upon this. Horse and plough, though basically unsuited to the cultivation of lazy beds, can generally be used on most but the smallest beds, but the problem now is to get hold of a horse for ploughing. Hence - as in at least one instance at Croir - where it is impossible to hire a horse and the land is unsuited to tractor operation - the choice may well be between spade cultivation or no cultivation at all. The situation is not eased by the difficulty of hiring any one of the three tractors in the area at a time when the land is in the best condition. This is all doubly unfortunate because of the universality of the lazy bed; this might be regarded as a symbol of a backward or even a primitive agricultural system, but is, in fact, an excellent adaptation to natural conditions of climate and soil - so long as there is plenty of hand labour. It is only when labour becomes expensive, or difficult to obtain, that the lazy bed becomes uneconomical. This is, of cours, another way of saying that the lazy bed was the concomitant of a designedly self-sufficient agricultural system; if it is well kept up, the lazy bed is a good means of conserving soil vitality and maintaining adequate drainage. In the past the hollows between the beds were cleared every year or two and the soil spread on top. Thus lazy beds, particularly those on slopes, need a good deal of hand labour as well as heavy fertilization.

It is very difficult to see the answer to the cultivation problem now labour is no longer freely available: there could certainly be more small tractors and cultivators, but even they lead to the throwing together of lazy beds, and - except in places such as Croir where drains may be laid below the loam on clay, or in certain favoured sites like part of 4 Crulivig where the peaty soil overlies a firm gravel substratum - it is impossible both to throw the lazy beds together and maintain drainage. One is faced with all the difficulties of drainage of peat in an area of heavy precipitation. The hill lazy beds, though they are better drained, all too often have too little depth of soil to make cultivation by tractor a practical proposition.

(1) Editorial note: This remark has been borne out by events; in 1960 township schemes totalling 88 acres were thus improved.

CHAPTER TEN

EAST LOCH ROAG DISTRICT

(Garynahine, Callanish, Breasclete, and Tolsta Chaolis)

GARYNAHINE by Anne Iredale and Jennifer Oxenbury.

131 Garynahine is a townships of twelve crofts which are situated on the eastern arm of
632 Loch Ceann Thulabhig. The crofts nowhere extend more than one-third of a mile from the coast. There is a hinterland of about 1,800 acres of common grazing, which is
133 mostly about 100 ft above sea-level, though it rises to 200 ft in a few isolated areas; the crofts are lower, and maximum elevation is 80 ft.

134 Most of the croft land is drained by the stream Allt Mhurchaidh which flows through all but two of the crofts. But the soils are heavy, and several crofters cut peat on their crofts. Many crofters complained that their land was too peaty for cultivation.

361 The crofts form a regular pattern beside the south side of the main road from Stornoway to Breasclete, with two small feus and a 21 acre freeholding on the north side of the road. In addition there is a farm (Garynahine Lodge) of 400 acres east of the crofts, and likewise stretching along the south side of the Stornoway road. The main road to Uig passes through the farm, dividing the cultivated area in the west from the grazing section.

195 The regular lay-out of the crofts dates from the formation of the township in 1935.
On the same site, but long cleared, there had been an older village about the same size
361 i.e. twelve crofts, known to be in existence in the 1850's. The crofts were in a similar position, but were a different shape, and the ruins of some of the croft houses still remain. This village was completely burnt out one gusty winter evening when, it is said, a spark from a crofter's pipe was blown onto one of the thatched roofs, and the wind quickly spread the blaze to consume the entire village. The crofters left the area, many going to the neighbouring township of Callanish; Garynahine then became one large farm until 1935 when the land was re-allocated into crofts. The new crofters came from a variety of areas, several coming from Crulivig, others from Breasclete and Callanish. The owners of the farm had also opened an hotel which prospered until 1945 when the farm was sold to its present owner Admiral Drummond, who has since used the house of a
241 private house. Nine acres of the farm land is cultivated, and the remaining 391 acres
311 are used for grazing. In contrast to the usual practice in this area the oats have been undersown with rye grass. Another beneficial innovation at the farm is the introduction of shelter belts. Trees have been successfully planted, making it possible to produce good crops of soft fruits such as raspberries, strawberries etc. Both the crops and the stock on the farm are of a high standard, showing that with capital and correct management the land can be remarkably productive.

In contrast to the large scale economy of the farm, the twelve crofts (ten operative units) are each between 4.6 and 6.2 acres, and the total reputed arable is 67.3 acres. In all there are only 9.5 acres under crop (oats 6 acres and potatoes 3.5 acres), and 2.25 acres under sown grass. The crofts are worked either by spade, horse (hire from croft 40 Callanish) or by tractor (hire from the Lodge). The seasonal rhythm of cultivation and of stock rearing is that in Callanish.

Enquiries soon reveal that crofting is not the main occupation of the croft tenants. Another indication of the declining interest in the land is the fencing of the crofts. All were fenced when they were formed in 1935; since then there has been no refencing. Now a grant is available to pay 75% of the cost of re-fencing but little has been done.

231 Stock totals (see Appendix C) have declined recently and this trend will probably continue. There are only four cows and two calves in the township (plus six at the farm).

INTRODUCTION

35 Hendry's recommendations. However, he promised to make experiments on the economic value of the 'bog-ore of iron' found in many parts of the island, with a view to making bar-iron. Peat was to be used as fuel for smelting.

With so much water on the island, it is natural to expect to find some of it harnessed for power purposes. The Gisla hydro-electric scheme is on the west of Lewis, to the west of the shores of Little Loch Roag. The Harris scheme is at Loch Chliostair, at the foot of the three peaks of Tirgearraic (3,227 ft), Uilleval (2,130), and Oreval (2,165). Scotland's 12 per cent of the island's total electricity production is generated thus, the remainder being diesel generation on Stornoway, (see Chapter 11).

Next to water, the island's most really available resource is its stifling blanket of peat, which covers more than 80 per cent of Lewis's land area. It has had a more than significant effect on the natural history of the area, its scenery and the human economy. When the deposits were studied, by Lewis in 1909 (detail in 1910-11), it was estimated that they covered no less than 250 square miles, in depths up to 16 ft; the average depth of peat over the whole island was assessed as 5 ft. On this basis the deposits would contain approximately 1 million tons of dried peat. Work carried out by the Peat Section of the Department of Agriculture & Fisheries for Scotland in 1951 indicated that the earlier estimates were slightly high.

In 1946-7 the Ministry of Fuel & Power reconstituted the peat deposits on both sides of the Stornoway-Barvas road and indicated that they were suitable for industrial utilisation. Yet today, despite these Government-backed investigations, the peat deposits of Lewis are still used only for domestic fuel. One of the points made by a 1952 survey was that a peat-based industry would be significant, forming the basis for the crofting township, as it did before crofts in the community were up under the influence of some agricultural land use such as barley or village, where there are peat-cutting rights, and to the north and west, the only communal land is the village green or common. In future, outside the crofting counties Acts, the rights of the crofter will be extended to the farm, with its tied cottages. Then come the full-time small-holdings important in the north-east and the southern Highlands.

AGRICULTURE AND FISHING

THE CROFTER

24 The pursuit of agricultural processes, their growth, development and maintenance, is a field in which the crofter for a secure society has never been easy on the island. The unyielding nature of the rock, Archaean gneiss, its non-existent or minute property, have all contributed to the resultant pattern and character of society, which emerges. Though one is tempted to define crofting as an agricultural activity, it is also something much more intimate: a way of life. To quote, the introduction to *The crofters of the crofter and crofter in the Highlands and Islands of Scotland* (1886) 'Habit and local affection bear so great a sway in the actions of crofters that it is doubtful if they would be found who would rather be proprietors in the mountains of Skye, or the waters of Lewis, than on the fertile plains of Maximlie.' There is the Island of Lewis, with poor, peaty soil covering the Archaean gneiss, but with a fertile, lovely, 'vivid community' and the Taylor commission in 1955 (Commission of Inquiry into Crofting Problems).

The Highland crofter is the subject of an extensive literature. Special monographs, one by Donald Macmillan, exist solely for the purpose of caring for his needs. He has special rights and privileges which are distinguished by the Land Court. Crofters' unions have formed themselves into a strong federated wall for the system's defence.

Socially, the term 'crofter' means, on the island at any rate, a landholder who cultivates his own (arable) holding, his croft. He ranks with the common persons with his fellow-crofters, each of whom has a right to carry a sum of so much stock, the 'soaming'. These are common pastures and in 1892 survey was that a soaming was generally of little significance, forming the basis for the crofting township, as it did before crofts in the community were up under the influence of some agricultural land use such as barley or village, where there are peat-cutting rights, and to the north and west, the only communal land is the village green or common. In future, outside the crofting counties Acts, the rights of the crofter will be extended to the farm, with its tied cottages. Then come the full-time small-holdings important in the north-east and the southern Highlands.

PRESENT INDUSTRY

of a building industry based on the crofters, and on Lewis 286 yarn and produce knitwear in addition to their woven fabrics. 195 However, it was found that the yarns used for Harris Tweed were unsuitable for knitwear, but being given sufficient twist in the spinning: before women use this tweed yarn for knitting, it is commonly practice to twist two or more threads of yarn together on a hand spinning-wheel.

Little in the way of craft work is done on the island, mainly 463 because of the lack of indigenous materials which could be used to produce commercial items. Marmarygear has been mentioned as being suitable for making agricultural wind-breaks, and 195 discoverers include sand-dunes, short-stemm and pebbles are plentiful both in quantity and variety of type and colour.

Small enterprises have developed on the island in marine and 394 engineering, mainly based on Stornoway, and boat-building. The 195 latter is a small but socially-significant firm in New with produced with a high reputation. Lewis Offshore is a small and highly-successful some significance, one of the most enterprising firms being built up literally from scratch so as to become a highly-successful building firm.

The unemployment problem

The island's unemployment problem is as much a matter of 464 concern today as it has ever been, averaging about 25 per cent annually (representing well over 1,000 people, compared with the Scottish mainland figure of 6.0 per cent; the contemporary figure for Britain is approximately 3.0 per cent). While unemployment 442 affects adults is serious enough, unemployment among teenagers 843 threatens the community's whole future. The island has its Youth Employment Officer, who has an unenviable task. Each junior and secondary school in the island is visited to interview schoolleavers, at least once a year; employment advice is given and this is supplemented by Careers Officers' visits.

Such employment as there is, exists at least over the island's limited spectrum are concentrated in Stornoway. They are, however, mainly in the sphere of the land, fish and hotel work for girls, with a few vacancies for apprentices in trades generally associated with building construction. Most of the jobs offered are very much in

ISLAND, WORK AND PEOPLE

PT. I

most northerly outlier, yet, in the main, one is struck not by the variety of rocks (except for the 'Stornoway Beds') but by their homogeneity. It is structure, causing the uplift of certain masses relatively to others, more than differences in rock-type, which has guided the work of erosion, in sculpturing both the Island's plan and the details of its forms. Subcurrence of the land has fronted the coastline into a zigzag line of ridge-capes alternating with valley-mouths flooded or 'drowned' by the sea, as inlet and loch.

Historically the geniuses were of little value. The fact that they had to spin and weave helps the Islander in building, as is helped his ancestors when they raised the great stone 'houses' of the Hebrides, and the Pictish Broch. Except where they are very basic (non-acid) in composition, they make poor road metal. Yet the geniuses are not quite devoid of economic uses: the Lewisian gneiss includes masses of pegmatite, and the only large body of anorthosite or lime-feldspar rock in Britain, which has been a source of alumina for glass manufacture.[1] Two feldspar quarries opened at Lingarbay and Northton in South Harris in 1941 employed sixty men annually (the war) the latter discovered being designated 'Lewisburgh for use in the Staffordshire Potteries in the manufacture of porcelain material. Today, the large granite material in Scandinavia and the better transport facilities there led to closing the quarries, with little hope of their reopening.[2]

4. Land-form and Sea Floor

133 The Scottish structure is due not only the Island 133 of economic uses, but also because of the well-defined rub-

[2] J. B. Cohen, "The Isle of Harris", Geo. Geog. Mag., vol. 87, 1, 1951, p. 52.

133 Great most of the parish the natural landscape is a series of low plateaus, generally below 200' O.D., around East Loch Roag, but rising eastwards to an extensive plateau 1 of 1,000 feet, which extends from the Loch Roag to the Atlantic Ocean. Its surface is covered with the various results of glacial erosion, including striations, roches moutonnées, transmission of North Herrin and south west Uig, with many precipitous slopes reaching to 1,000 feet, and numerous lochs. The Loch Roag, which is a drowned valley, has been formed by glaciation, and is fronting the Atlantic with very high cliffs, which are the justice of granite and gneiss. A very many traces discontinuity, but formed entirely of gneiss. The Loch Roag is a drowned valley, and is fronting the Atlantic with very high cliffs, which are the justice of granite and gneiss. A very many traces discontinuity, but formed entirely of gneiss. The plateaus are far from featureless, being dotted with lochs, and the surface is covered with the various results of glacial erosion, including striations, roches moutonnées, transmission of North Herrin and south west Uig, with many precipitous slopes reaching to 1,000 feet, and numerous lochs. The Loch Roag, which is a drowned valley, has been formed by glaciation

INTRODUCTION

136 a cow in a wonderful richness—one might well spend an hour or so with J. A. Harvie-Brown's *A Fauna of the Outer Hebrides*. The Hebrides are one of the twelve faunal regions of Scotland, and is becoming increasingly the spotting-ground for amateur and professional ornithologists. They are birds such as the skua and red-necked phalarope, breeding at the southernmost limits of their range. The golden eagle, corncrake and redshanks thrive, though found in other parts of Scotland, are more plentiful in the region because of the low incidence of human interference; hunted, merlin and peregrine falcon are also found. Many birds are peculiar to the area: there are Hebridean subspecies of twite, dunnock, song-thrush and wren. Since 1962 the blue tit has been found in the Stornoway woods. And 1960 saw the first arrival of the collared dove, an incomer which, like many a Lewisman, has taken a liking to the place and settled down to establish its flourishing community. On Gallown Hill, a low rising overlooking Stornoway, is a large rookery; rooks first reached the island in 1855. Jackdaws arrived at the turn of the century and are now quite numerous. As might be expected, the adjacent harbour and foreshore of Stornoway provide a suitable area for purple sandpipers, turnstones and redshank. Gulls abound. The estuary area just north of Stornoway is the haunt of widgeon, shelduck and teal, amongst many other birds; a ruff was seen there in 1956. Melbost beach has the largest ternery in the islands, with arctic, common and little terns sharing life together.

The birds on the shore line are mostly waders, divers, ducks and seabirds. Cormorant, shag, gannet, fulmar, arctic skua, terns, gulls of all kinds and oyster-catchers can be found. The full variety of the island's bird life can be seen by visiting not only those dotting lands to the sea, but the cliff-tops, which often have their own numerous bird colonies. The sea's edge, with the push-pull tides, is indeed another area with abundant life of all kinds. Bladderwrack (*fucus vesiculosus*) and knotted wrack (*ascophyllum nodosum*) are the most common seaweeds, the latter now a significant factor in seaweed-processing activities (Chapter 6). From time immemorial seaweed has been a natural resource in the island's economy, used as manure to supply the necessary element of organic matter to keep the land in good heart. Keeping the sea-

FAUNA

Emptiest the sea—
136 weeds company are the whelks, razor-fish, limpets and mussels, whelks and barnacles, many cones used for food, but now left to grow in great numbers, to the delight of seabirds.

For anyone who wishes to have a full list of the richness of fishes found in the inshore waters of the island, there is the Harvie-Brown and Buckley volume (1888) in the *Vertebrate Fauna of Scotland series*. Of the ocean fauna, most famous of course are the common and the grey or Atlantic seals, the latter being one of the largest and most robust of British mammals. A great breeding place for the common seal is the island of Shillay, which lies a mile or two from Pabbay, off the western end of the Sound of Harris. All the island's outliers, North Rona, Sulasgeir and the Shiants, offer a place for breeding. The basking shark, the porpoise, and the blue shark are among other large creatures that frequently haunt Hebridean sea-waters.

LAND WEALTH

In minerals the island is poor. Feldspar was quarried in Harris during the second world war, but it is doubtful whether the working was economic. The feldspar quarries opened at Lingerbay and Northton in South Harris in 1941 employed some sixty men, the material being sent from Leverburgh for use in the Staffordshire Potteries, for the manufacture of porcelain insulators. The high-grade mineral found in Scandinavia, and the better transport facilities, led to the close-down of the Harris quarries. At Lingerbay, however, a small quarry yields anorthosite, a white granite used as an abrasive for cleaning products. A recent survey discovered deposits of asbestos on the island of Scarp to the west of Harris.

For some reason there has been, through the centuries, a belief in the mineral wealth of Lewis. As far back as 1616 the records of the Privy Council show an entry "Anne patent sealed to be past to Archibald Prymrose of the copper and lead mynes in Ila, Sky and Lewis." The Fife Adventurers and the last Lord Seaforth were also optimistic. Lord Seaforth went so far as to commission a survey on the resources of the island by a mineralogist, the Rev James Headrick, in 1800. Nothing much followed Mr

SULASGEIR

Dean Monro, in his 1549 account, refers to the vast numbers of wild fowl and mentions that the men of Wester Ross and Lewis stay for seven or eight days and bring back a boat full of dried wild fowl and feathers. The *Old Statistical Account* (1796) says: "There is in Ness a most adventurous set of people who, for a few years back, at the hazard of their lives, went there in an open six-oared boat without even the aid of a compass." The boat, says the *Account*, could not be pulled up out of the sea, and therefore, while some of the men worked on the birds, the others had to stay in the boat on the most sheltered side of the deserted island. This custom of hunting young gannets (or 'guga') on Sulasgeir still continues. Under the Protection of Wild Birds Act, 1954, the gannets can be killed legally, but so that the breeding colony can continue their old custom, a Statutory Order was passed making a special concession 31 August each year at the end of the close season) of the gannets on Sulasgeir. With North Rona, Sulasgeir is one of the great breeding grounds for British oceanic seabirds.

The Lock Roag islands

The one large inhabited island off the Lewis coast is Great Bernera, though technically it is not now an island, for it has been connected to the mainland in 1953 by a bridge. Lingay and Vatersay, off the Ayr coast, are the other islands in Lock Roag. The population reached a peak of 780 in 1911, but has now fallen to about half that figure. Off the west of Great Bernera is Little Bernera, which in Dean Monro's time was 'inhabit and manurit', but which has had no population since the 1880 census. Dean Monro describes it as full of rough little crags, but with fertile earth between.

Also in Lock Roag are three islands which, now deserted, once supported families: Pabbay had 17 people in 1861, 9 in 1881, and none since. Vacsay had five men in 1861, and none since. Orasay in 1891 had one man and one woman, but none since.

The Flannans

Belonging again to the parish of Uig is the group of islands known as the Flannans, or Seven Hunters, some twenty miles

ISLAND, WORK AND PEOPLE PT. 1

137 Inset into the Highlands are three desolate tracts of boggy "Peat Moor", in Sutherland, Rannoch Moor far to the south, and on the plateaus of Lorne and Mid-Argyll; while marginal to the Highlands are (i) the drier and more dissected plateau peat moors between Lochnagar and Stonehaven, and (2) the intermittent stretches of Lowland peat moss.

137 Finally, intermixed with these are strips of surviving or planted woodland. Below the heather moors of the western Highlands stretch the great pine woods of Atholl, Deeside, and Speyside and the Moray Firth. As the glacier retreated from the west, it left behind thin fresh water lochs. In the Lewis there are 8 waters with take of salmont. . . . " There were also " Whales . . . " In " a cove a fathom deep at the ebb sea, sues Whytum (whitings) to be slain with hulls ", there were " very many haddocks and Men with their wandes sitting [as today] upon the Craige of that cove, and Lades [boys] and Women also. . . . In this He there are many Sheip for it is very guid for the same. For they lay furth ever one mures and sheip and ane mure and ane sheip and ane hous and ane bot anes in the seire pluckit off them in some faulden." In Zetland wool is still plucked, not sheared.

The description of reclamation is specially worthy of note: " "In this country all is peit mossland at the Sea cost, and the place where he wins his peitts this zeire [year] . . . Quhair he sawes his corne the nixt zeire, after that he guddis it weill with Sea ware " [*i.e.*, improves or manures it with seaweed]. On " Eilan Colm Cill [an islet apparently on the east coast south of Stornoway at the mouth of Loch Erisort] Macleod of the Lewis has a fair Orchard, and he that is Gardener has that Ile [rent] free. . . . "

Around the coast of Lewis no absolute limit is set to

INTRODUCTION

175 that the spade and foot-plough (*cas chrom*) were used for
175 double the area ploughed. From Monro and from the
185 precise Statistical Accounts of the eighteenth century, it is
[241] clear that pony-drawn ploughs were usual in the smoother
[242] parts of Lewis. In North Harris are 'abundance of
127 Deir'. We must not forget here that 'faire' and fertile
[136] are comparative terms for the West. " Lewis is faire and well inhabit at the coste, are fertile and fruitful countrey, for the maist part beire [barley], with 4 Parroche Kirkes."
[222] There is " ane castell callit Stornoway . . . with 3 salt
[223] pans, very fair and pleasant by, but so that the pans fresh water lochs. In the Lewis there are 8 waters with take of salmont. . . . " There were also " Whales . . . " In " a cove a fathom deep at the ebb sea, sues Whytum (whitings) to be slain with hulls ", there were " very many haddocks and Men with their wandes sitting [as today] upon the Craige of that cove, and Lades [boys] and Women also. . . . In this He there are many Sheip for it is very guid for the same. For they lay furth ever one mures and sheip and ane mure and ane sheip and ane hous and ane bot anes in the seire pluckit off them in some faulden."

THE SEASONS

[241] mica-spangled gneiss show the intense shearing. And crushed rock,
[242] known as flinty crush because it splinters so easily, adds another
[243] sight for the modern eye. The Stornoway brick, too, are added. If
[244] are broadly known as pre-Cambrian sandstone, old red sandstone,
or triassic; some geologists regard them as part of the pre-Cambrian torridonian series.

From geological evidence, twice did vast icebergs move over the rock-faces to round off the sharp corners of the island. And, as individuals, then as now, geologists think that there may have been a third small glaciation—a private Hebridean one. Today, the scenery bears the impress of glacial work, and of ice-gouged. Polished rocks show scores; lochs are gravel-dammed, and there are countless small lochans and tarns formed from deep groughs in solid rock. Peat moss, too, is found in many places, formed in ancient staking during a much later post-glacial time. Many times have fishermen found, far below the present high water mark, stumps of trees and buried submarine peat, the wasting remains of former land vegetation. Martin Martin, who wrote of the Western Isles about 1695, said of Borreraig, which is the small island in the Sound of Harris: " The west end of this island which looks to St Kilda, is called the wooden island, because there is a great number of trees under the water, which have formerly grown there. Sir Norman MacLeod told me that he had seen a tree cut there, which was very forward towards a harvest." The Stornoway Museum indicate a former fertility. Volcanic action and deposit, the makings of good soil were, however, largely carried away by glacial action and to leave a thin scraping of weathered soil on the bare rock for dear life. [241]

[243] Lewis is largely rolling moors of blanket peat with many lochs and rivers To the west of Lewis, in Uig, high hills begin to raise the eye. In North Harris, the hills are higher, reaching their peak in the Clisham (2,622 ft above sea level). These are mostly speaking mountains. But they do present not a few problems to climbers, having some of the treacherous of Highland mountains, and are virtually uncalculable cliffs. Much of the ice-moulded landscape of South Harris is rocky and barren, gneiss outcrop cover some areas in places, and are almost completely devoid of any kind of vegetation, except where, in the odd crevice, like lurk-

PEAT AND RIVERS

The peat overlays of the island were reckoned to be not much 241
more than 7,000 years old. It appears, however, that the megalithic circle of Callernish, on the west of Lewis, was excavated 242
by Sir James Matheson in 1857-8, a depth of 5 ft of peat was removed to expose the giant stones. Only the tops of these stones were showing before excavation was begun; the resultant calculation confirmed the age of this infertile blanket. Peat is decomposed organic matter without the sweetening of lime. The resultant material is sour, and highly acid in character, which checks the bacterial action necessary for good soil to be made. With composition and age, peat becomes colloidal in texture, with a water content of about 92 per cent. Peat is still being formed in Lewis, though its progress is imperceptibly slow.

Frequent diggings have uncovered evidence that the island was 137
once densely wooded. The remains of trees, and the hewn stumps and birds associated with savannah and woodland, add point to this. Under the blanket of peat lies what is called 135
boulder clay, glacially deposited on the gneiss rock; many acres 134
of this clay have been exposed through centuries of digging up 137
peat for fuel. Such skimmed ground is called *gearraidh*, and they form the basis of a soil which, when worked together with shell sand and seaweed, becomes quite fertile. Of natural soil, so much 135
taken for granted in richer places in Britain, there is little, few patches in Lewis, at Garrabost and Ness; the valley of Stornoway, near Rodel in Harris, has much strong red loam. 137

INTRODUCTION

133 One glance at an island map will show how numerous are the
[132] lochs. These and the short rivers and streams do their best to drain
the rainwater which accumulates in the peat moss, and added a few
inches or so for precipitation in the form of very fine rain or mist.
That the rockbase of the island is much like an impervious saucer
which overflows easily is seen by shortly after a heavy rainfall.
Streams and rivers become torrents of brown, foam-flecked waters
tumbling to the sea or to some nearby loch. The watershed of
Lewis runs from north-east to south-west, keeping about the
middle of the island, except for its north where it approaches the
eastern side. The rivers, although short, are fairly large, and the
[132] history carried good stocks of trout and salmon; some still do
The Grimersta River, though less than two miles long, is reckoned
to be the best salmon river in Europe. Its waters rise from the
great loch and catchment area of Loch Langavat (Norse: Long
Water). The River Creed, given by Pennant, is known in Harris
for its salmon which, in the right season of year, can be seen a
tantalizing arm's length away, making their way up river. Another
salmon river is that beside Amhuinnsuidhe Castle in North Harris,
where the salmon leap several feet over a sheer rockface to gain
the upper waters. Of the lochs, virtually all abounding with
trout, the largest is Loch Langavat, about six miles in length.

FLORA

• 137 The first reaction of the visitor to the island is to comment on the
scarcity of trees. 'Treeless' is a relative term, however, for there
are trees on the island. And the island was not always so bare.
After the last Ice Age retreated from thirteen millennia ago, the
initial tundra was covered by birch scrub which developed into a
wide birch-pine forest with some dense hazel undergrowth. Oak,
alder, birch, pine, ash and rowan could be found. Then, with
the advent of the cold, wet, sub-Atlantic period about 3,000 years
ago, conditions became ripe for the formation of blanket peat
and the accumulation of peat. The trees failed and fell; natural
clearings formed. When the Norsemen visited the Hebrides, they
found substantial areas of woodland, deteriorating, but not
sufficient to attract their attention.

ing thieves, patches of heather, deer-grasses or moorland plants live as they can on thin layers of peaty soil. To relieve the hard scenery there are, on sunny days, glintings of water, lochs or rivers flowing uneasily over beds of primordial rock.

PEAT AND RIVERS

The peat overlays of the island are reckoned to be not much more than 7,000 years old. To strengthen this figure, when the megalithic circle of Callernish, on the west of Lewis, was excavated by Sir James Matheson in 1857-8, a depth of 5 ft of peat was removed to expose the giant stones. Only the tops of these stones were showing before excavation was begun; the resultant calculation confirmed the age of this infertile blanket. Peat is decomposed organic matter without the sweetening of lime. The resulting material is sour, and highly acid in character, which checks the bacterial action necessary for good soil to be made. With compaction and age, peat becomes colloidal in texture, with a water content of about 92 per cent. Peat is still being formed in Lewis, though its progress is imperceptibly slow.

Frequent diggings have uncovered evidence that the island was once densely wooded. The remains of trees, and the bones of certain animals and birds associated with savannah and woodland, add point to this. Under the blanket of peat lies what is called boulder clay, glacially deposited on the gneiss rock; many acres of this clay have been exposed through centuries of digging up peat for fuel. Such skinned ground is called *gearraidh*, and it forms the basis of a soil which, when worked together with shell sand and seaweed, becomes quite fertile. Of natural soil, so much taken for granted in richer places in Britain, there are a few patches in Lewis, at Garrabost and Ness; the valley of Strond, near Rodel in Harris, has much strong red loam.

Keepint the sea-
136 weeds company are the whelks, razor-fish, limpets and mussels,
[262] winkles and barnacles, many once used for food, but now left to grow in great numbers, to the delight of seabirds.

For anyone who wishes to have a full list of the richness of fishes found in the inshore waters of the island, there is the Harvie-Brown and Buckley volume (1888) in the *Vertebrate Fauna of Scotland* series. Of the ocean fauna, most famous of course are the common and the grey or Atlantic seals, the latter being one of the largest and most robust of British mammals. A great breeding place for the common seal is the island of Shillay, which lies a mile or two from Pabbay, off the western end of the Sound of Harris. All the island's outliers, North Rona, Sulasgeir and the Shiants, afford a place for breeding. The basking shark, the porpoise, and the blue shark are among other large creatures that frequently haunt Hebridean sea-waters.

LAND WEALTH

135 In minerals the island is poor. Feldspar was quarried in Harris
316 during the second world war, but it is doubtful whether the workings were economic. The feldspar quarries opened at Lingerbay and Northton in South Harris in 1941 employed some sixty men, the material being sent from Leverburgh for use in the Staffordshire Potteries, for the manufacture of porcelain insulators. The high-grade mineral found in Scandinavia, and the better transport facilities there, led to the close-down of the Harris quarries. At Lingerbay, however, a small quarry yields anorthosite, a white granite used as an abrasive for cleaning products. A recent survey discovered deposits of asbestos on the island of Scarp to the west of Harris.

135 For some reason there has been, through the centuries, a be-
*175 lief in the mineral wealth of Lewis. As far back as 1616 the records of the Privy Council show an entry: 'Ane patent ardanit to be past to Archibald Prymrois of the copper and lead mynes in Ila, Sky and Lewis.' The Fife Adventurers and the last Lord Seaforth were also optimistic. Lord Seaforth went so far as to commission a survey on the resources of the island by a mineralogist, the Rev James Headrick, in 1800. Nothing much followed Mr

FLORA

175 137 177 Pursuing a 'scorched-earth' policy, a Norse leader, Magnus Bareleg, on a punitive expedition to Lewis in 1098 destroyed much of the island's natural surface resources. Trees were a particular target. Following this wanton destruction, the shrinkage of wooded areas in the island was accelerated by the requirements of the 136 population and by the developing peat. Captain Dymes, an Englishman who visited Lewis in 1630 in connection with Charles I's fishery schemes, reported 'there are many eagles and hawks in the isle which breed in the clefts of rocks, for this place is so destitute of wood that there is not one tree growing in the whole island.' Martin Martin almost confirmed this a generation later: 'I saw big roots of trees at the head of Loch Erisort, and there is about a hundred young birch and hazel trees on the southwest side of Loch Stornoway, but there is no more wood on the island.' Before Sir James and Lady Matheson came to Lewis in 1844, the MacKenzie gardens outside the old Seaforth Lodge, where Lews Castle now stands, had many fruiting apple trees.

The mention in 1695 of the Stornoway plantation is interesting, for it is here that today stands the greatest concentration of trees in the whole of the Hebrides, in the grounds of Lews Castle. Some 300 acres of trees here, mostly conifers, but with some hardwoods and deciduous trees, were planted by Lady Matheson about a century ago. Soil had to be transported from the mainland to supplement the scanty layer of peat which overlay the hard Lewis rock. Another of Lady Matheson's legacies is a small area at Achmore, one of the few townships to be found inland, far from the sea. Here, larch and other conifers grew well and would be there today had not a fierce gale blown them down in 1921. There 137 are some ninety-year-old Corsican pines at the head of Little Loch Roag. Another plantation of deciduous and coniferous trees can be found at Grimersta on the Atlantic coast of Lewis, and two more small areas of trees are at Scalisgro, on the east side of Lewis, and in Glen Valtos. In Harris, there are some magnificent sycamores at Tarbert; and at Borve, on the west side of the island, are several acres of stunted mountain pines. In addition, dwarf rowans cover many tiny islands in the lochs.

137 132 Natural tree growth is impossible in most areas because of the peat. The strong and frequent winds are also a deterrent. The

INTRODUCTION

137 132 isopeths of average wind-speed show an overall figure of 17·5 mph. Winds of gale force (8 or more on the Beaufort Scale) occur in Stornoway about twenty times a year, and blow for an annual average of about 378 hours, loosening trees from the shallow ground and stunting growth. Yet another factor is the fine salt spray, 'small rain with salt in it from the sea', which is carried far inland over the island, the prevailing winds blowing straight off the Atlantic Ocean in a south-westerly to westerly direction.

137 133 The flora of Harris and Lewis merits a full volume on its own. Far from being sterile, the moors, the hills, the machar-lands, the islets in the lochs, all present subjects of great interest. To the botanist, the island is a region of moorland with loch, marsh, bog, burn and high hills, with sometimes extensive patches of the old man's skin protruding to show the Lewisian gneiss. Variation is offered by the addition of rocky hill-slopes, fine sea-cliffs and shingly bays; sandy parts add to the floral variety, richest in the marine outreaches. To catalogue the flora is to list names which can be appreciated only by seeing the plants themselves in the habitat which they have taken as their own, much as the Hebridean *homo sapiens* has taken to himself the 'savage' country which awed early tourists. Rare species have been found by visiting botanists, and are discussed in the work of Professor Heslop Harrison and his group from Durham University. There is colour aplenty at all seasons of the year in the island; one merely needs to train the eye to look for it, to find, for example, those miniature woodlands in such places as the gorge of the river Amhuinn Gillan Tallair, in south Harris. And in particular, one might mention the blaze of whins around Stornoway; the luxuriant wild growth on the sandy machar-lands in Uig; just north of Stornoway, and at Ness; the miniature sieges of growth on the lochs' islands; and the Alpine plants associated with the higher reaches of land in Uig and North Harris.

Whereas the land is a relatively poor place, the sea is rich, and so is the flora and bird-life to be found round its shores. Near the shore line the grass has a sweet taste liked by sheep. Much of the flora is typical of the island, suited to withstanding the lack of humus to act as a sponge for water, and the paucity of soil for roots. Marram grass, scurvy grass, sea pink, sea campion, thrift

FLORA

133 and pearlwort are all to be found. It is not often that a plant is 137 given some measure of authority over the affairs of man: but the marram grass—known as 'bent', but not to be confused with the grass botanically referred to as bent *(Agrostis sp)*—is vital in stabilising the sand of the machar-lands; unless grazed or cut, with its dense network of roots it anchors the sand in perpetuity. With 231 the marram, the sea-sedge works hard to form a green coverlet over the sand, and acts as host to other plants, the shell-sand grassland offering excellent grazing for crofters' stock.

137 The richness of the flora of the macharland has been sung many times, and little wonder. It holds a multitude of what can be called plebian plants such as ragwort, buttercup, daisy, kidney vetch, bird's-foot trefoil, tufted vetch, gentian and primrose. Unfortunately the heavy grazing of these stretches of land results in many plants never being given the opportunity to develop and flower for the plentiful propagation of their species.

FAUNA

136 The entomologist will also find much of interest. The Hebrides have their own bumble-bee *(Bombus jonellus* var. *hebridensis)*, found nowhere else in the world. Other insects too have found an insular form, adding their rich thread to the weave of natural history in the region: the Dark Green Fritillary butterfly and the Green-veined White. Moths there are in abundance, some such as the Gray Dagger perhaps indicating the existence of woodland conditions in a past time. The abundance of lochs, streams and marshy grounds gives an abundance of dragon-flies and caddis-flies, eight species of which are represented.

Of wild animal life, however, the list is short, due to lack of shelter and poor ground. The red deer is found in the hilly fastnesses of Harris and the Park district of Lewis, though the deer are small, and well poached as one might expect where the density of human population is high. The pine marten, until the 1810s, lived in the region near the Clisham. A rare bat, the pipistrelle, has been found at Rodel. Rats, mice, rabbits, hares and otters are of course to be found.

The interior of the island is poor in bird life, but round the

INTRODUCTION

[136 [13] coasts there is a wonderful richness—one might well spend an hour or so with J. A. Harvie-Brown's *A Fauna of the Outer Hebrides*. The Hebrides area is one of the twelve faunal regions of Scotlar 1, and is becoming increasingly the spotting-ground for amateur and professional ornithologists. They see birds such as the skua and red-necked phalarope, breeding at the southernmost limits of their range. The golden eagle, corncrake and red-throated diver, though found in other parts of Scotland, are more plentiful in the region because of the low incidence of human interference; buzzard, merlin and peregrine falcon are also found. Many birds are peculiar to the area: there are Hebridean subspecies of twite, dunnock, song-thrush and wren. Since 1962 the blue tit has begun to colonise the Stornoway woods. And 1960 saw the first arrival of the collared dove, an incomer which like many a human, has taken a liking to the place and settled down to establish its flourishing community. On Gallows Hill, a low rising overlooking Stornoway, is a large rookery; rooks first reached the island in 1893. Jackdaws arrived at the turn of the century and are now quite numerous. As might be expected, the adjacent harbour and foreshore of Stornoway provide a suitable area for purple sandpipers, turnstone, heron and redshank. Gulls abound. The estuary area just north of Stornoway is the haunt of widgeon, shellduck and teal, among many other birds; a ruff was seen there in 1956. Melbost beach has the largest ternery in the islands, with arctic, common and little terns sharing life together.

The birds on the shore line are mostly waders, divers, ducks and seabirds. Cormorant, shag, gannet, fulmar, arctic skua, terns, gulls of all kinds and oyster-catchers can be found. The full variety of the island's bird life can be seen by visiting not only those sloping lands to the sea, but the cliff-tops, which often have their own numerous bird colonies. The sea's edge, with the push-pull tides, is indeed another area with abundant life of all kinds. Bladder-wrack *(fucus vesiculosus)* and knotted wrack *(ascophyllum nodosum)* are there in great quantity, the latter now a significant factor in seaweed-processing activities (Chapter 6). From time immemorial, seaweeds have been a natural resource in the island's economy, used as manure to supply the necessary element of organic matter to keep the land in good heart. Keeping the sea-

[137 [824 [241

AGRICULTURE AND FISHING

*175 241 134 311 [181 islanders' manufacture of cloth. The inhabitants were at least a century behind the times, though they were, he found, in no way deficient by nature. They were social in their own style, and they had very good heads, 'that is, for people not accustomed to habits of thought'. So far as agriculture was concerned, nothing in the way of draining the land had ever been accomplished; nor had any effort been made to penetrate the hard sub-soil. He held that the great scarcity of timber had been a serious handicap when it came to agricultural implements—to their renewal, repair or possible improvement. Under direction, however, he was convinced that improvements in land use would result in considerable benefits to the island. He added that he hoped the period of this improvement would not be far off and that visitors would find 'a green, pastoral land instead of a dreary waste'.

[137 [412

*175 242 134 311 Yet not until 1928 was peat reclamation and development again brought out for an airing. This time, the benefactor was the late Mr T. B. MacAulay, a Montreal magnate, a son of Lewis connections. He gave £10,000 to establish an experimental farm in Lewis, and a site on Arnish moor, not far from Stornoway, was chosen. It was typical of most of Lewis: black, water-holding peat, which when squeezed, instead of allowing water to escape from it like a sponge, oozes itself through the fingers. The aims of the farm were to provide additional arable land on which to grow winter fodder, and to improve, at as low a cost as possible, the grazing on the moorland. Fifty acres were certainly converted from moorland to arable, and this formed a basis for an experimental extension to another 100 acres. By 1936 the farm had a sales income from produce of about £1,400. The stock in that year included 40 head of thriving cattle, including 15 dairy cows, 20 poultry, 140 blackfaced sheep, and some fattening pigs. The sheep were a late addition, made with the dual aim of pasturing on moorland too deep and soft for cattle in wet weather, and of improving the sheep strain of the island.

[231

By 1938, it had been shown that some lasting improvement on moorland of reasonably favourable slope could be effected at a materials cost of about £3 per acre, and without heavy labour costs. Thus, the common grazings held by the crofting townships could be improved, if a co-operative effort were organized. So

The inner harbour at Stornoway, taken from Gallows Hill. Lews Castle, now the Lews Technical College, is seen on the left.
The trees of the Castle policies were planted by Lady Matheson

Tallow, 7 stones	1	3	4
Salmon, 1 barrel	3	0	0
Total =	£860	15	0

The most important event in the agricultural history of the land at this time was the introduction of the potato. Though the exact date is not known, some evidence from the writer on Lewis in the *Old Statistical Account of Scotland* (1796) places it about 1757. 'With the utmost difficulty . . . the people were prevailed on to plant potatoes, but of which they now plant great quantities by the plough and by the spade, and find them to be the most useful of all crops raised in the Parish.'

The substantial tacksman seemed, in Lewis, to deal kindly with those who called him Fear Baile (Town Man—almost a mayor, without the trappings and self-elected). Serious complaints against tacksmen are few. But winds of change were blowing. John MacKenzie, who had for some years been Chamberlain of the Lewis estate, was examined before the Napier Commission in Edinburgh in 1883. He knew the island's history well.

Till the beginning of this century, the greater part of the Lewis was in the hands of tacksmen, or middlemen, who got in some cases from their sub-tenants in money, produce, and labour what nearly paid their rents. There were the MacIvers of the Parish of Stornoway, the Morisons and Murrays of Barvas, the MacAulays of Uig, and the MacLeods of Lochs. When Mr Stewart-MacKenzie married the Hon Lady Hood, daughter of Lord Seaforth, and took the management of the estate into his own hands, he did away with the middlemen and let the land directly to the crofters. This, no doubt, was a step in the right direction, but it had its disadvantages, as the example of a good middleman, who looked after his people, and who was industrious in farming and attentive in stock-breeding, was beneficial to the people, though in some cases they may have been petty tyrants.

CROFTER INDUSTRIES

according to the amount of barilla (its great competitor, a carbonate of soda made from plant ashes) which found its way into the British market. When the American war interfered with the imports the kelp price was as high as £22 per ton. Prices began to decline about 1810, and from 1822 successive reductions in duties on salt and barilla resulted in the decline and demise of the kelp industry. As a consequence great distress appeared in those districts which had founded their whole economy on seaweed.

The weeds of most value to the industry, because they yielded most salts, included *laminaria digitata, laminaria bulbosa, ascophyllum nodosum* and *fucus serratus*. One ton of kelp yielded an average of 8 lb of iodine, with certain quantities of chloride of sodium, chloride of potassium, and carbonate of soda. When subjected to special treatment and distillation, 2-3 cwts of sulphate of ammonia, and several gallons of naphtha, paraffin oil, and volatile oil were also derived.

The fishing industry, discussed in the previous chapter, took over where the kelp-making industry left off and became another king-pin in the island economy. By the end of the last century it seemed set fair for continuing prosperity. In 1900, harbours were being planned and built with State aid in Uig, at Carloway, Ness and Tarbert. Then 1914 came, and with it sweeping changes in international trade. Island fishermen were left workless with wrecked and rotting fishing boats. In twenty years the number of Scotland's fishermen was halved; the remainder were all but ruined. The islanders' fate mirrored this pattern.

Yet another significant source of income for island families for almost 200 years came from the men in military service, who either sent money home or returned home with their gratuities and pay. In the wars of the last century many enlisted in the Highland regiments, the Navy and the Merchant Marine. Even today, the income from this external activity is not insignificant.

EIGHTEENTH-CENTURY ECONOMY

Information and statistics about the economy of the island in the middle of the eighteenth century are to be found in Walker's *Economical History of the Hebrides or Western Islands of Scotland*; his MS is in the British Museum.

TRADE AND INDUSTRY

useful crofting ancillary which, unlike many others, is soundly based on a definite commercial demand. Various industries use the extracted acid for some 150 products. The Scottish alginate industry, the second largest in the world, is based on the process of E. C. Stanford, who discovered alginic acid in 1883, though today modern methods are used. For raw materials it has turned to the old kelping shores of the Hebrides and Northern Isles. On the island it has a factory at Keose on Loch Erisort, a site chosen for the easy access afforded to puffers; the factory receives the weed, dries, mills and bags it, and the boats then carry 200-ton loads to Girvan. The factory itself involved some £30,000 of capital layout and has a capacity of 120 wet tons per week—4 wet tons producing 1 dry milled ton. About a dozen Harris and Lewis crofters gather the seaweed crop, the most useful type being bladderwrack or rockweed *(ascophyllum nodosum)*, from the shores at Loch Erisort, East Loch Roag and Bernera in Lewis, Husinish and Scarp in Harris, and Loch Seaforth. Where there is road access the weed is cut by sickle and loaded into a lorry, but more often it is cut at low water to be floated with the incoming tide and rafted to Keose, hauled by motor boat.

A product of the land not readily associated with the Hebrides is bulbs. Bulb-growing deserves a mention, however, if only because the experiment to see whether it could become a commercial possibility in Lewis was carried out by the children of Lionel (Ness) Junior Secondary School. The MacAulay (Rhodesia) Trust made an investment of £150 to cover initial expenses, and success followed. When the original project was completed it was extended, sales bringing the school a useful sum. But an attack of disease brought production to a standstill in 1966.

Another small industry is the aerated-water plant at Ness, which is operating with reasonable success, and could do better if imports of aerated waters from abroad were reduced. A number of recent surveys made in the island have found great interest in such activities as shell-fish processing in Harris to produce semi-preserves, using mostly cockles and mussels. Local knitting already has a name for its products and a potential for extension on a commercial scale; this latter began in late 1966. Some forty years ago knitting specialists went to Lewis to investigate the possibilities

PRESENT INDUSTRY

of a knitting industry based on the crofters, who would use Lewis yarn and produce knitwear in addition to their woven fabrics. However, it was found that the yarns used for Harris Tweed were unsuitable for knitwear, not being given sufficient twist in the spinning: before women use this tweed yarn for knitting, it is common practice to twist two or more threads of yarn together on a hand spinning-wheel.

Little in the way of craft work is done on the island, mainly because of the lack of indigenous materials which could be used to produce typically-island items. Marram-grass has been suggested as being suitable for making agricultural wind-breaks, and close-woven basket-work. Shore-stones and pebbles are plentiful both in quantity and variety of type and colour.

Small employment outlets on the island are marine and motor engineering, mainly based on Stornoway, and boat-building. This latter is a small but socially-significant firm in Ness with products with a high reputation. Construction and general building is of some significance, one of the most enterprising firms being built up literally from scratch so as to become a highly-successful island business.

The unemployment problem

The island's unemployment problem is as much a matter of concern today as it has ever been, averaging about 25 per cent annually (representing well over 1,000 people) compared with the Scottish mainland figure of 6.0 per cent; the contemporary figure for Britain is around 3.0 per cent. While unemployment as it affects adults is serious enough, unemployment among teenagers threatens the community's whole future. The island has its Youth Employment Officer, who has an unenviable task. Each junior and secondary school in the island is visited to interview school-leavers, at least once a year; employment advice is given and this is supplemented by Careers Officers' visits.

Such employment openings as exist over the island's limited spectrum are concentrated in Stornoway. They are, however, mainly in shop work, mill work and hotel work for girls, with a few vacancies for apprentices in trades generally associated with building construction. Most of the jobs offered are very much in

ISLAND, WORK AND PEOPLE PT. I

summits of up to 2622 feet. South of this chain of hills the ground drops again on a peninsula some twelve miles long and only seven miles wide. This forms the more populous part of Harris with its 'sandy shore', the Machar, facing the Atlantic, and its rocky bays and fishing hamlets on the Minch.[1] Lewis has its 'machars' too, areas of white shell sand, which is so light that it blows up the hillsides, thus improving the pasture-land; but there is little 'machar' on the eastern coast, save for the south-western shores of the great sandy North or Broad Bay, enclosed by the peninsula of I, or Eye, which also acts as the outer breakwater for the harbour of Stornoway.

Landing at Stornoway and leaving behind us the pines, and the wind-pruned sycamore woods around Lews Castle, we find ourselves among the small fields of the villages which are partly suburban to Stornoway. Inland stretch the gently rolling, brown and somewhat melancholy moors that cover so much of the Lews. From the Butt of Lewis to the beginning of the Harris hills one could make a bee-line SSW., midway through the Island for over thirty miles, without passing a house or a strip of corn, and seeing only a tiny, ramshackle hut, a shieling (or *àirigh*), used for six weeks in the year when the cattle are taken to the summer pasture. All the villages are in sight of the sea, and generally close to it, with only one inland exception, Achmore, south-west of Stornoway, founded after 1850. The hills of Harris are not less lonely than the moors of the Lews.

Diversity is one of the fascinations of such an island as this. Although, like the founders of Stornoway, all

[1] *Am machair* ('ch' as in 'loch', also anglicised as 'macher'), n.f. the plain, smooth beach-land or links. A sandy beach or ebb-strand, *tràigh*, n.f., backed by *machair*, contrasts with a pebbly beach, *cladach*, n.m., backed by rougher beach-land, as in the Cladach district of W. Lewis.

/p. 35/

133 tively to the rolling upland in the north. Ages of 'normal' denudation by running water must have worn away most of what later rocks may have overlain the gneiss, smoothing the Island's forms. Glaciation, however, played the latest part in this process, roughly planing its lower surface as it flowed out to the open sea, or widening the stream-veined valleys and gouging out the corries which make the craggy beauty of the Deer Forest of Harris.

A characteristic of many of the lower hills of South Lewis and of Harris is the greater steepness of their slopes to west than to east (or south-east) and the drift material heaped there. Scenically, this lends a feeling of rhythm to the skyline when viewed from north or south, as of westward moving waves. It was the ice-sheet, working upon structure and pre-existing form, which steepened the western slopes 'to lee' of its westward flow, by its 'plucking' action.

133 The chief and most important characteristic of the
• 137 major surface of the Island is its rolling, hummocky topography, so different from that of a river-sculptured
[182] land. Negative as is its influence upon the life of plant communities, animals and men, its importance can hardly be exaggerated. Whereas river and stream drain a land, as they etch their way into its surface, and their deposits are laid down in gentle, regular slopes, glacier and
[134] ice-sheet leave an irregular, ill-drained surface. Upon this surface, waterlogging takes place, the life of plants and soil bacteria is slowed down, and so peat accumulates, rather than the humus which might enrich the soil in a similar temperate climate upon better drained slopes. Not only the climate of the present, but of the past, hinders the processes of plant life, and all that these can mean to man.

133 clay is exposed, leaving what is vividly called 'skinned'
314 land. And where drift is exposed, the mineral constituents
134 are leached out, and a hard 'moor pan' is left a few inches
[356] below the surface.

Seen from the edge of the crofts, the typical 'skinned
134 lands' of bare, blue or brownish clay, littered with stones,
• 137 suggest a desert. Often, only a few blades of grass or tufts of heather grow on them. Indeed, 'skinned land' seems at first too mild a term, for on it the stones—thickest on top when undisturbed, and bleached by the acids of the peat that overlay them—suggest the prophet's 'field of bones'. One can only ask, is the rest of his vision ever to be fulfilled and life to spring again? In some hilly parts to south and west, not only the 'skin', the topmost layer of peat, but the very soil, the flesh as it were, is still being
[166] stripped bare to the bone, the actual rock. The evacuation of the islet of Bernera Beag (Uig) was largely due to this stripping. In the more level parts to the north, however, roadside pits show sections of clay with few stones, covered with perhaps six inches of clay with many stones. It is this top layer which gives the skinned land such a hopelessly stony appearance, and shows that reclamation is less miraculous than it seems.

134 With the coming of carts and lorries the increasing use
of shell sand has become possible, whether for spreading
242 on the land or for slipping into pockets, together with
[178] fertilisers, for potato seed. As to soils, shell sand and boulder clay possess complementary qualities in texture
[493] and chemical composition. The shell sand of the machars provided an early home for man, the light soil allowing rye, a poor variety of oats, and herbage, to ripen early and mature in late, wet seasons when the clays are sodden with rain. Yet the sand itself is so light that drought is

82 Two sayings sum up the lag of the seasons in the West
824 and its effect on crops. The first runs, "Winter comes
241 not till after New Year, nor Spring till after St. Patrick's Day" (*Cha tig Geamhradh gu cul Calluinn, no Earrach gu*
[538] *cul Fheill Paruig*). St. Patrick's Day is the 17th of March, but old-style reckoning put both dates later still. The
[538] other runs, "A frosty winter, a misty spring, a chequered summer, and a bright, sunny autumn, never left dearth in Scotland" (*Geamhradh reodhtanach, Earrach ceothanach, Samhradh breac riabhach, us Foghar geal grianach, cha d'fhag gort riamh an Alba*). The retort is that though western summers may often be chequered with sun and showers well suited for growing grass and grain, the autumns are not really sunny, but rainy. Hence 'dearth'—of grain—must result from spoiled harvests. Not so for grass, unharmed by a wet autumn. Hay, if ensilage is not possible, can usually be gathered unharmed in sunny spells
[132] of summer if cut in good time. Agriculturally, the climate favours 'grass' rather than grain.

132 Plentiful rainfall and coolness throughout the year do
• 137 not allow of complete neutral decomposition of vegetable
[134] matter in the presence of air. Hence, year by year, a residuum of acid humus accumulates as peat on the ill-drained surface. Prehistorically, more favourable phases of climate permitted the growth of pines. Knowledge of present temperature and rainfall alone would suggest the growth of broad-leaved deciduous trees, but these are absent except in the sheltered policies of Stornoway Castle. About 1695 Martin noted 'hazel and birch' occurring on the south side of Loch Stornoway, but nowhere else on the Island. Even there trees are stunted as if pruned by the wind.

132 The further inhibitive influence is indeed the wind

(B) VEGETATION

1. *The Vegetation-types and Pastures of the Highlands and Isles*

•137 311 In order to see the Island problem in true proportion, the types of vegetation and rough pasture in the Highlands and Isles should be outlined. Dr. Hardy's reconnaissance botanical survey of the Highlands, with its coloured map, has been utilised in the compilation of *A Reconnaissance Map of Vegetation of Scotland.*[1] The latter has been boldly simplified in Fig. 7.

The Highland pastures are of two main regional types, eastern and western, with the addition of a few great stretches of peat moor. East of a line from Stirling to Inverness, heather is dominant, as it is on the heights around the Dornoch Firth, from north of the Cromarty Firth and Ben Wyvis to the border of Caithness. To the west of this, heather, though still found, is mixed with [233] grass and sedges. The grazings of the North-west Coast have been the adopted home of Cheviot sheep for over a century, for Cheviots are grass-feeders which cannot thrive on heather-tips. True, acid 'Dry Grass Moors' lie inland from the Beauly Firth and Dingwall. On the rest of the West Coast from Gairloch and Loch Torridon south to Kintyre, 'Marshy Grass Moors' with but little pure [233] heather clothe the lower slopes. These give way on higher slopes to 'Mountain Pastures', reaching up to about 2500

[113] [1] M. E. Hardy, *Esquisse de la végétation des Highlands d'Écosse*, Paris, 1905; also *Scot. Geog. Mag.*, 1906, June number with map, and May number with text. A. Geddes and L. D. Stamp, *A Reconnaissance Map of the Vegetation of Scotland* (Ordnance Survey, 1/625,000: 10 miles to inch), 1953; explanatory pamphlet in the press. A résumé by L. D. Stamp has appeared in his *Land of Britain: Its Use and Misuse*, 1948, based on Tansley, *The Vegetation of the British Isles*, 1946.

311 feet. These marshy grass moors, with their mountain
233 pastures above, are the adopted home of the hardy Black-

FIG. 7.—Map of vegetation-types and pastures of the Highlands and Hebrides

face sheep. Wherever in the west the slopes drop fairly steeply, good pasture grass with some heather may grow, or rather did grow until bracken overwhelmed them.

3: Geddes K-4, 5 (1919-1952) 1955 ES10 Highland Scots
Lewis and Harris

Inset into the Highlands are three desolate tracts of boggy 'Peat Moor', in Sutherland, Rannoch Moor far to the south, and on the plateaus of Lorne and Mid-Argyll; while marginal to the Highlands are (1) the drier and more dissected plateau peat moors between Lochnagar and Stonehaven, and (2) the intermittent stretches of Lowland peat moss.

Finally, intermixed with these are strips of surviving or planted woodland. Below the heather moors of the western Highlands stretch the great pine woods of Atholl, Deeside, and Speyside and the Moray Firth. As the heather thins out, towards the West Coast, pine gives place to oak. Near both are found the graceful silver stems of the birch, with its small resistant leaves. These woodlands invite the modern forester, who brings in pine, larch and firs in the east and, in the west, notably the Sitka spruce, brought here from the rainy western highlands of British Columbia.

The uses to which the pastures are or have long been put, are three: as crofters' grazings—mostly 'commons' (and so indicated on the map), as sheep farms, or as deer forests. (1) On the 'commons' there is close grazing for both cattle and sheep by crofters near the townships or the holdings, and much peat-cutting. (2) On the hill sheep farms there is more or less regulated burning and some hill draining but almost no cattle pasturing; and as a result of both facts, bracken has invaded the grassier moors. (3) On the deer forests almost no care is given and the heather, scrub and bracken are coarse and strong. An indication of the margin of the commons, according to whether it 'marches' with farms or with deer forests (given in Fig. 2 by line C), is also shown in Fig. 7 because of its marked effect on vegetation.

2. *Plant Life in Lewis-and-Harris*

Lewis has been dismissed by many as a floating p bog, and its name has even been derived from *leodus* bog! For good or ill, peat influences the Island, its histo the distribution of its people and the economic and so features of their life. In Lewis, peat once covered eve thing except the narrow fringes of sandy machar, surface of the inland waters, jutting rocks and steeper h where drainage is rapid. Man's encroachment on t carpet has so far been mere nibbling. Except for machar lands, every acre of ground occupied or cultiva by man has been reclaimed from peat.

The Map of Vegetation and its Key portray the d tribution of the main plant communities (Fig. 8). plants are of low habit with small leaves, well protec from excessive transpiration. They are mostly perenni or biennials; annuals are comparatively few. There is burst of flowering save where the heather blooms better-drained slopes, or where shell sand has blo enabling clovers, vetches and meadow-sweet to give colo and scent. Moss, sedge and dwarfed heather prev widely in tussocks.

Constant cropping by sheep and cattle, and also de tends to keep vegetation low, but on the wide, boggy moo this is a minor factor. Nor is there much systema heather-burning. Even upon the islets of inland loch untouched by grazing animals, and in spite of better drai age due to the undercutting of the waves, growth is n really luxuriant. Bracken, however, is found on the isle and a little on some former sheep farms, but not on t heavily grazed common pastures, for cattle keep dow bracken.

[see p. 50 -- analyst]

137 there is frequently found the most thriving of the vege-
[311] tation types of Lewis and the best grazing ground. It
[233] includes grasses such as those already named, together with purple *Molinea*, meadow soft grass (*Holcus*), and mat grass (*Nardus*); sedges (*Scirpus* and *Carex* spp.); with the field wood rush (*Luzula*) and a fair number of flowering plants. Heather is common in this and the following community (3).

With true 'hill' pastures, found especially to the east of the Forest of Harris and between Loch Seaforth and Loch Shell, are included fair pastures with good grasses on the rocky hillocks near the villages around Loch Roag and also on the low, steep hills northward to Shawbost.
[134] The 'skinned land' lies in strips too narrow to be shown on the map, but may form a ring of desolation round the village. The hard moor-pan resists natural seeding of plants unless broken by the pick, but broadcasting of a cheap seed-mixture with a little fertiliser can work marked improvement.

(3) *Marshy Grass Moors.*—Where the slopes are gentle, and the acid humus has accumulated to form peat, is found coarse, tussocky, damp pasture, of sedges and grasses, grading from the 'fair' and 'hill pastures' to the beginnings of hummocky peat hags and smooth sedge moss. It covers the slopes of hills such as Ben Barvas and Muirnag and the hillocks that emerge from the great central trough of brown peat moor. It also characterises the low but broken areas in southern Lewis. This type forms a belt below the 'hill' and 'rocky' pastures of Harris. At its best its prevailing hue is olive-green turning to a silvery shade and then to russet later on. Annuals are few and the grasses are coarse.

[133] (4) *Peat Moors, Mosses and Peat Hags.*—The most

137 widespread plant community in Lewis is undoubtedly the
[133] *sedge and cotton grass moors* (or 'mosses' as they would be called in the Lowlands), which overlie deep peat generally at low levels, on flat or slightly rolling grounds. The peaty floor is waterlogged and boggy, and the carpet rises into tufts, dense cushions or mops, out of which bristle innumerable stalks, thread-shaped, sheathed, fibrous and elastic. There are few flowers apart from the bog asphodel, while heather does not thrive but is stunted. On the slopes, sedges (*Scirpus* and *Carex* spp.) and cotton grass (*Eriophorum angustifolium*) dominate, and in the hollows, sphagnum moss. Owing to slope and consequent erosion, the surface may break into hags (or 'bruachs'), separated by deep and more or less broad channels of bare peat with puddles.

[311] For reclamation by tractor and peat plough, smoothness is essential, combined with some slope for drainage. From observation of the fragments of poor pasture topping the hags in channelled eroded peat, it can be noted that drainage alone is not enough to create good pasture, though it
[241] is the first step. In order to complement the work of drainage, fertilisers must be applied to encourage plants which absorb water in quantity and transpire it freely in the course of rapid growth. For it may be said that plants like heather—adapted to withstand drought, physical or 'physiological'—do not transpire water in any great quantity. Thus they fail to 'drain the ground from above', as juicier grasses or fodder plants do by the vigorous ascent, transpiration and renewed absorption of water.

[134] (5) *Heather Moor.*—The common heather (*Calluna*) dominates on many steep slopes and rocky bluffs, sometimes on acid humus, or again on decomposed rock and screes, generally at low levels. Among the chief plants

137 found with the dominant are the fine-leaved bell heather, sometimes with crowberry (*Empetrum*) in rocky places, while grass or sedge may be mixed with it in places.

At the very edge of the sea-cliffs, where the moorland pasture or heather thins out, the rock is cushioned with sea pink. Or where a stream has cut a sheltered dell, protected as in the Stornoway policies or not too near a village, one may find a few woody plants—a little hazel, creeping willow or honeysuckle.

137 (6) *Sandy Pastures.*—In many bays, as at Valtos (West
134 Loch Roag) the sandy or sand-influenced habitat falls into three zones:

(*a*) The line of storm beach, formed of hummocky dunes, which dams off what was the inner part of the bay. This line is more or less broken where the stream breaks through. At their crown the dunes are partially fixed by marram grass (*Psamma*), but show hollows of loose sand. Just north of Stornoway the Melbost sands have thrown out a high bar which has partly dyked and reclaimed or poldered the bay behind. Almost at the opposite end of the Island, lying in from the Sound of Taransay, near Luskintyre, a sandy dyke is thrust out, but this too is kept open by tide and spate, and the sands within are covered at high tide. Such places could be reclaimed.

(*b*) Behind the dune ridge, where this is virtually com-
[132] plete, is found a dry sandy flat. Even this is liable to inundation by storm, tide and spate, but its sandy pasture is periodically broken for the cultivation of potatoes, or even barley. It is the lightest of soils at the best, while if cultivated continuously it simply

137 blows away, no doubt because the humus rots and
134 quite fails to bind the sand. These two types together form the true machar.

(*c*) From the machar rise the slopes of drift-covered rock which bear a top dressing of blown shell fragments, more or less mixed with the soil by treading and cultivation, and imperceptibly giving place to the undiluted 'black soils' of moor and croft with their corresponding vegetation or crops. The shell-sand is often blown onto the rough pastures high above a bay.

Where a portion of the true machar has been cultivated it is allowed to seed itself. A sprinkling of weeds is followed by the re-establishment of a mixed flora. In both the sand and the consolidated sand-covered drift grow wild white clover and vetches; and among the grasses are rye grass (*Lolium*), Yorkshire fog (*Holcus*), cat's-tail (*Phleum*) and meadow grass (*Poa*). Other plants include familiar weeds and wild-flowers like yarrow, cow-parsnip, golden rod (*Solidago*), silverweed, wild carrot, thyme, plantain, sorrel, yellow rattle, harebell, eyebright, pansy and many more. Arrival from the bare brown moorland to the sand-blown slopes or dells is made a pleasure by stream-side flowers like meadow-sweet.

137 *Woods and Cultivation.*—In addition to the woods indi-
311 cated on the map, in Stornoway Castle policies, shelter-belts or plantations occur at certain lodges. Cultivation, as will be explained in the section on crofting, is rarely continuous; and the map shows areas as cultivated which are far from being either continuous crop land or
[185] even permanent grass of the first quality. Yet since this map was drawn the improved area has been extended somewhat

[see map on p.50--analyst]

137 by reclamation, notably at the Macaulay Demonstration
311 Farm on the 'peat moss' of Arnish Moor (south of
185 Stornoway), then too small to be shown, and in South-west Harris where new crofts were laid out in the thirties.

137 The six main types of vegetation in the Island may be grouped as three. First are the Hill Pastures and Moors: (1) 'Rocky' among the bare hill-tops of Harris and Uig, and (2) 'Fair' on favourable slopes, which merge into (3) 'Marshy Grass Moors' of coarse grass and sedges, heath and rushes. Secondly come (4) the vast brown 'Peat Mosses and Moors', either smooth and wet, with sedge and cotton grass, or channelled and cut up into hags; near the broken edges of the island cliffs this expanse is often fringed by (5) the 'Heather Moor'. Thirdly, by the sandy bays, are (6) the 'Machar lands', *i.e.* the 'Sandy Pastures', rich with clover; though narrow, this coastal plain is all important to stock-rearing and potato-growing, and so to settlement. In traditional terms, these three groups form hill moor, peat moss and sandy shores: *monadh*, *mòine* and *machair*.

(c) CROFTING AND THE CROFTERS' YEAR

1. *Place of Settlement and Choice of Work—Past and Present*

195 Lewis and 'Harrey', as they were called four centuries
114 ago, were well described by Dean Monro,[1] and his descrip-
311 tion is fundamental to the present scene. "Harrey is very fertile and fruitful for corne, store and fishing, twice mair of delving is in or of teilling", which appears to mean

[113] [1] Dean Monro, *The Western Islands of Scotland . . . in 1549*, reprinted by A. Mackay, Stirling, 1934.

311 indication of their worth. As above, the period is *c.* 1937–
511 1938. The Island's increased sheep stock is shown in Appendix II (ii) (a) to 1953.

[233] The Lewis and Harris pastures carry on an average about one ewe to 9 or 10 acres, that is, one ewe or lamb to 4 acres in June (the month of the agricultural returns). A good mainland grazing like Glen Shiel carries one ewe to 6 acres, while poorer grazings like Kintail and Farr carry one ewe to 10 or 14 acres respectively. Nowhere, however, can the rough grazing support the newly weaned ewe lambs (or hoggs) throughout the winter, which have either to be brought to the enclosed 'low ground' (of which there is never enough to supply both grass and winter feed) or sent to the Lowlands in autumn and brought back in spring, at a total cost of about 10s. each before 1939. In Lewis, for lack of grass, there is considerable loss in winter among the crofters' sheep. Constructive measures for the future must be based on an increased supply of winter feed.

• 137 The game consist of red deer, grouse and hares, while
511 salmon and trout are fished in stream and loch. The deer range over Harris, Park and the Uig hills, but are seldom seen north of Achmore. They are of ordinary quality and size, and before 1939 the average number of heads for the year totalled about 190 stags and 80 hinds. It is not known
[529] when they were introduced. In the south there may be a certain amount of 'deer stealing', as in most deer forests surrounded by crofts, in spite of a score of keepers and deer-stalkers, and other employees at shooting lodges. Grouse are relatively scarce compared with those on drier
[825] mainland moors. Mountain hares have multiplied since their introduction in 1853, when, it is said, the first hare, seen near a village towards evening with its white winter coat, was thought to be supernatural.

511 coat, was thought to be supernatural. The fishing, too, is
226 of good standard: a typical annual catch including 1700
511 salmon, 5000 sea-trout and 1800 brown trout; and it was for this, as well as for the shootings, that the moors pertaining to the different shooting or fishing lodges and hotels
• 137 were bought at Lord Leverhulme's sale. The absence of
233 foxes was important to sheep-rearing before the introduction of guns, and is still a favourable factor.

5. *Sea-fishing*

226 Fish have always contributed to the diet of the Islesfolk,
198 whether they fished from coracles or boats, or with 'lang wands' from the shore as they still do, and as they did in
[262] the days of Dean Monro and, no doubt, right back to
[433] neolithic times. The relative importance of fishing and
[241] agriculture, however, has always varied according to place and time.

Fishing in modern and historic, and also in prehistoric,
182 times—to judge from the kitchen middens of Uig—has
226 always flourished more where there were deep sea-lochs;
241 and settlement resulted, even though rocky hillsides made ploughing difficult or impossible. Conversely, agriculture
[198] has offered better opportunity on smooth coasts with a
[172] variety of soils, though fishing was poorer there. Thus the men of Stornoway Bay and Eye, of eastern lochs and of the Harris bays, like those of Loch Roag on the west, have long been partly fishermen. In the extreme north, too, men of Ness—with the chance of choosing their fishing grounds on the north, west or east of the island and with their little rocky port giving shelter, of a sort, from south-
[461] west gales—were good fishermen; they are good seamen
[829] still. "The fishing of the Barvas folk" is an old gibe,

133 townships and at Islivig and Breanish, the peat is thin (or has been stripped) to reveal a
gravelly drift. Wave-drifting on suitable slopes. In such places a black loamy soil has
137 been developed by cultivation; the many ditches of lazybed cultivation are not necessary
241 and, if the area is large enough, it can be worked by tractor. Such soils, in the climate
197 of west Lewis, are eminently suitable for rotation grass, for hay or pasture, and much more could be done with them under knowledgeable management. Where shell sand has been blown inland on to peaty soils the natural top-dressing has had a remarkable ameliorating effect on texture and acidity. Such areas are all too limited, the most important area at Valtos, Knasp and Reef, and around Uig bay; smaller areas are at
134 Mealasta, Mangersta and Bosta (Barnera). The hill grazings are dominated by a thin
137 heather cover, blue moor grass and, in wetter places, sphagnum and cotton grass. Since
• 241 the cattle population has been declining many older residents claim that the pastures, particularly near the townships, have deteriorated, the proportion of grass declining and coarse heather increasing. "The hills that were green when I was a boy", said one, "are now black". Neglected arable and pasture land, too, soon reverts. Rushes and flags invade the ditches between the old lazy beds and, if the ground is at all waterlogged, soon invade the beds as well. Drier ground, if not well grazed, soon reverts to heather. The limited machairs are little better; almost devoid of humus, they show little development of soil profile, only a thin grey layer of turf roots; rabbits, or injudicious cultivation readily set off wind erosion. Only where the wind has provided a natural blend of peat and machair are conditions better. Such areas are very limited.

132 The climate is in many respects severe; no local statistics are available, but some for Stornoway and Benbecula are appended. The frequency of high winds has a bad effect on both vegetation and stock, but to some extent wind counteracts excessive moisture. Near sea-level, where all the township are situated, frost and snow are almost unknown. Thus it is exposure to the wind that limits the outwintering of stock, not low temperatures; this suggests that if pastures could be improved in suitably sheltered places far more advantage might be taken of the relatively mild winter temperatures. It is believed that the sunshine record is particularly poor in the south, where clouds can frequently be seen hanging over the mountains when the sun is shining on Barnera and the area north
[246] east of East Loch Roag. The relatively dry and sunny period which commonly occurs in
[221] May and June ought to make for a good hay harvest; unfortunately the natural meadows, such as they are, are late starters, and the custom is to cut the grass when it has gone to seed. This hay is often being taken in September - one of the wettest months in the year.

CHAPTER TWO

SOME HISTORICAL ASPECTS

172 Evidence of pre-historic and other early settlements in the parish is afforded by the occurence of standing stones, brochs and duns. The Callanish circle and its satellites are by far the most remarkable ancient monument in the Hebrides, and testify to the former importance of the site even though today their precise significance may not be clear. Most of the duns are now little more than circular heaps of stones, but in that at
[174] Dunne Carloway the double walls still stand to a considerable height. A later phase of
[174] settlement is recorded in the place names, a very large proportion of which contain Norse
[103] elements such as -nish, -vick, -boat and -shader; it seems probable that most of the
[162] present township sites have been more or less continuously occupied since Norse times.

1. [Presumably the author means "drift"--Analyst]

CHAPTER FOUR

THE ATLANTIC COAST

(Brenish, Islivig, and Mangersta)

by

Pamela M. Gough.

131 Brenish, Islivig and Mangersta are situated in the extreme south-west of Lewis, on the Atlantic coast of the parish of Uig and forty miles from Stornoway.

133 Brenish has a south-westerly aspect whilst Islivick faces north-west; in both the elevation of the crofts decreases seawards from about 125 ft. in the east to 50 - 25 ft. in the west. Only one croft in Islivig, and the eight most southerly crofts in Brenish, run to the sea - the rest obtain some shelter from a line of low hills about 300 yards wide and rising to a little over 100 feet, which forms their western boundary. The land terminates in low cliffs from 25' - 100' in height, and a rocky foreshore. Behind these townships to the east a range of mountains from 1,500' - 1,800' in height and dominated by the highest hill in Lewis, Mealisval, (1,885'), gives protection from easterly influences.

134 Mangersta lies to the north of these mountains; here the crofts lie in a sheltered valley to the west of which the land rises to over 200 feet. The valley opens southwards to the sea where there is a sandy beach and machair. The crofts range from about 150 feet to 100 feet above sea level; those nearest the sea have soils which contain a substantial proportion of machair sand.

Soils are generally deep, and there are few rocky outcrops on the crofts which are fairly level. In Brenish and Islivig the soils are mainly peaty, becoming wetter in the west. Where visible the sub-soil is gravel or stony boulder clay. In Mangersta the transition from peaty soils on the northern crofts to sandy soils on the southern crofts, is marked by the increasingly continuous cultivation, drains being unnecessary on the latter.

• 137 There are no trees or shrubs, and vegetation consists of marshy grass moors in the
Mealasta area with a considerable amount of cotton grass bog further north. West and south of Mangersta the machair area is characterised by a calcareo plant community similar in content to that found in many parts of the chalk and limestone areas of England.

361 Brenish and Islivig are old settlements, never cleared. In both, the sites of the
[174] original clachans can still be seen clustered around the mouths of their respective streams. The houses are now situated at the east end of the crofts, near to the road.

175 To the south, Mealasta - cleared in the 1840's to make a sheep farm - was divided in
632 1921 to give enlargements to the common grazings of both Brenish and Mangersta. The
311 arable land was divided into twenty-nine shares as enlargements to Brenish crofts, and is held in a modified form of runrig.

Mangersta was cleared in 1837 to make a farm; subsequently fishermen-cottars settled on the farm but they moved to Dun Carloway in 1873. In 1910, however, a new township of thirteen crofts was set up by the Congested Districts Board; the new settlers were cottars, mainly from Brenish.

139 Alluvial soils have developed along the lower reaches of Amuinnn Thoraghair and the Erista river.

134 There are no trees apart from an occasional stunted rowan or willow - willows for
[624] peel making grow still in some old garden enclosures. Hedges, too, are rare so, although individual houses are often carefully sited, there is little cover and the townships as a whole are very exposed to westerly gales. The natural vegetation developed on the machair is of fine closely matted grasses with a good deal of natural clover - very similar to that found on chalk downland. On the peaty moorland the usual moor grasses mosses and heather are dominant, though little encroachment by bracken was noticed.

311 In Crowlista the strip layout of the crofts dates from a lotting about 1850, (Figure 14)
361 in the new townships, laid out about 1921 (Figure 15) the majority of the crofts are
127 less strip-like and do not run to the shore. Indeed in Ardroil and Timsgarry only five out of twenty-one reach the shore and the rocky headlands with their machair are valuable parts of the common pasture. The six crofts in Carnish run from the shore at the foot of the esker up its flank towards the southwest and almost to its summit. They also have one or two small plots each on the machair.

[133] Crofts in Ardroil are in one piece. An old cattle road forms the north west boundary; from this they rise, steeply in places, to undulating moorland just over 200' high. Numbers 5 - 8 Timsgarry are strips across the Erista valley, rising northwards to just over 170'; 2, 3 and 4 are allotted to make use of arable land on the lower slopes of Knock Valabrie. The houses of crofts No. 1 Timsgarry and No. 1 Ardroil are the former farmhouses.

In Crowlista most of the crofts remain unfenced but in Carnish, Ardroil and Timsgarry
[417] all are fenced and many of the fences were being repaired or replaced in 1959. They are not open for common grazing during the winter. Patches of sown hay are fenced within each croft.

There are six recognised croft-holdings in Carnish; one is sub-let so that there are
[56] only five "operative" units; two of those are not worked. One has been resumed by the proprietors and is being quarried as an extension of the main quarry between the township dyke and main road. In Ardroil each of the fourteen crofts is worked as a unit - though two carry no stock; in Timsgarry eight crofts are worked as seven units.

In contrast to the above, the old settlement of Crowlista has twenty-five recognised crofts but, by amalgamation and sub-letting these are worked as fourteen units. The Crowlista crofts are small - fourteen are 4.0 acres or less and of those only one is worked as a unit. Crofts as small as 1.5 acres and with a sown of eight sheep can never have been intended to support a family; they are the result of sub-division in earlier generations; the remains of two pigs and a curing house point to the importance of
[948] fishing in the past. Twenty-one men were employed in fishing boats about 1914. Sub-letting usually takes place between relatives; of some of the fourteen operative units are quite complicated. One example will suffice (croft numbers are here replaced by letters to prevent publication of personal matters):-

Crofts a, b, c and d are worked as a unit (although they are not adjacent). The tenant of a and b sub-lets c and d for grazing; he also helps with the work on yet a fifth croft. The present b is half of an original croft. West of the road the original croft is held in fissed runrig between b and another croft, not part of this multiple "working" unit; east of the road it has been divided into separate strips. The tenant lives on b.

Since 1959,
166 54 people have emigrated whereas only 4 have immigrated. Most of the girls have to
462 leave home when they finish school as there is no employment locally. Many of them go into domestic service or nursing in Glasgow. Many of the younger men also spend time away from home, often in the Merchant Navy. Breasclete is also the temporary home of the families of lighthousemen on duty in the Flannan Isles.

288 Although the people live and work on the croft, weaving the Harris Tweed provides the main source of income. This is a rather irregular occupation owing to the uncertain demand for the tweed, and although the men are nominally self-employed they rely on the mills to supply them with work. The tweed is woven on treadle looms, which, with ancillary equipment such as bobbin winders, are all owned by the crofters.

[158] As 1959 was a good year for the tweed industry, there was an air of prosperity in the township, and with the aid of government housing grants many new bungalows were being erected. But should there be a slump, the crofts would be unable to support the population and most of the bread-winners will have to leave.

TOLSTA CHAOLAIS by Roger H. Thomas.

131 The township of Tolsta Chaolais lies in a shallow glaciated depression occupied by Loch
133 a' Bhaile and Loch Shader. Most of the crofts are situated near the shore of these lochs,
361 for westward to the sea the terrain is too rocky and irregular for either settlement or cultivation, whilst to the east of Loch a' Bhaile the land slopes precipitously from 250 ft. to the loch shore. As Figure 36 shows settlement takes advantage of the more gentle drift-covered slopes, generally of small extent.

137 Cultivation is very noticeably limited to three areas - along the west shore of Loch
[241] a' Bhaile, along the north-east shore of Loch Shader, and in the valley of the small stream draining from the north into the head of Loch a' Bhaile. Most of the croft land is composed of rock outcrops, rarely exceeding 12 in. in height, separated by damp depressions frequently filled by reeds and rushes; bracken was apparent only on three crofts. In particular, the area between the two lochs is badly in need of draining and is largely colonised by reeds and very coarse grasses, of no use whatsoever as pasture. One enterprising person suggested that the township should hire a ditching machine - this could certainly be put to use with great advantage.

632 The settlement comprises 43 registered crofts, 6 feus, 2 squatters, 1 cottar, and
311 2 holiday bungalows, with the croft holdings aligned north-east/south-west between the two lochs and the sea, except for nos. 28 and 29. The 53 holdings are unofficially
427 amalgamated in various ways and so reduced to 35 operative agricultural units. The acreage of crofts varies from 2.1 to 20.75 acres, a considerable variation. Fencing of the crofts - except for 1A, B, and C, and 12A, B, and C which are held 'run-rig' - was carried out between 1945 and 1950, whilst in 1946 the common pasture of 2,700 acres was fenced into two parks - an inner and an outer one, the division coinciding with the Carloway to Breasclete road. An area stretching from crofts 18A to 21 has, however, been not haphazardly divided. The seaward halves of some five crofts were redivided amongst seventeen crofts in the southern half of the township to compensate them for lack of grazing area within their own croft boundaries. This division is said to date from about 1886.

241 Most of the cultivation is carried out with hired tractor, although two crofts owned
[807] small mechanical cultivators. Ploughing by tractor and horse, as the opportunity and cultivation, depends either on the urgency of the operation, or on the accessibility of the plot, for any small patches of cultivation on the rougher terrain are dug by spade, as

[TEXT CONTINUED ON PAGE 95]

CHAPTER ELEVEN

THE CARLOWAY DISTRICT

by

Brian Loughbro

131 The seven crofting townships of Upper Carloway, (including Carloway Park), Borrowston,
133 Garenin, Kneck Carloway, Dun Carloway and Kirivick form a compact area of land in the
[128] north of the Parish of Uig bordering the coast and Loch Carloway. Here the Lewisian gneiss has a thin discontinuous covering of glacial drift which has been
341 developed immediately above the head of Loch Carloway. Three valleys help to determine the layout of the townships and settlements (figure 37). The townships to the north-
133 west of the Carloway river are found on more gentle slopes than those to the south east where the slopes are less uniform and are less uniform and are often broken by short steep rocky faces. The north western area therefore offers an environment where almost continuous cultivation is possible whereas in the south - at the frequent rock outcrops have led to fragmented cultivation on minute plots which are inaccessible to the tractor or other mechanised implements.

139 The soils are heavy and acid even on the skinned land of the boulder clay slopes nor
[134] is there any machair to mitigate the acidity of the peaty soils which descend almost to the shores. Only in one place is there any trace of the influence of the sand and this is to be found where the crofts numbered 1 to 3 Garenin border the small bay in the north of that township. Here the fierce gales have blown some of the finer beach deposits on to the croft land.

Much of the peat has been cut from the inner common pastures except in the case of Upper Carloway where active cutting is still taking place in the valley where fleshs are
137 cut for use in separate settlements, to the east of the "half-way" pitch. On the common
311 pasture the vegetation varies from peat moss and heather with bracken to fescue and close turf on the skinned land by the road to Dalcrone. On the upper common pasture heather and bracken have increased since the abandonment of the shielings and the reduction of the cattle stock; many inhabitants remember that the hills once had a much greater aspect. Nor is this a feature confined to the common pastures; on one croft in Upper Carloway 1.9 acres are completely covered by heather whilst a neighbouring croft has a good crop of oats on similar land. At the loch in both Kneck and Upper Carloway areas of former arable land have reverted to moss, the old lazy beds being picked out by lines of reeds.

361 Settlement. The settlement pattern is one of great interest for it shows in a clear way the effects of the district phases in the historical geography of the area. The evidence of success and failure stands side by side. Before one can attempt to justify this assertion it is necessary to give a brief account of the physical evolution and distribution of settlement.

361 The origin of permanent settlement is believed * to have been the permanent occu-
176 pation of shielings used by people from Bernera until the eighteenth century. Until about 1850 arable land was held run-rig and the houses were huddled together in tight little clusters. When individual crofts were lotted, about 1850, the houses were scattered, each on its croft and generally up to fifty yards from the present road (which was then no more than a rough track). Sea access was then most important but since the advent
241 of modern road transport new houses have been built nearer to the roads, producing the
178 modern markedly linear plan. The roads extend at different heights across the slopes

* based on information supplied by Mr Macleod of 27 Garenin.

[TEXT CONTINUED ON PAGE 101]

[Seaforthead]

161 Table XVII reinforces the idea that there is a striking dichotomy between the agricultural
162 and fishing townships. The former are characterised by a more stable population trend,
166 significantly fewer of the population in permanent employment forth of Park, and a smaller loss by
167 migration. In the fishing townships, where growth and decline have been equally meteoric,
281 there is a larger proportion of persons in permanent employment forth of Park, and migration
555 losses have been greater. It is also significant that there is a smaller natural increase of
552 6.5 per cent in the agricultural townships. The only township which shows a natural decrease over this period is Calbost, one of the fishing townships.

SEAFORTHEAD AND SHELDERNISH

Rachel A. Hirst

131 Seaforthead and Shialdernish are separated by 4,485 acres of rough grazing, the former
lying on the northern shore of Loch Seaforth and the latter on the southern shore of Loch Erisort.

SEAFORTHEAD

Seaforthead, the most isolated of all the Park townships, consists of three crofts and a
159 gamekeeper's holding. The township boundary is situated between the 50 and 75 foot contours
361 which at their furthest extent are only 150 yards from the shore. Immediately behind the road the land rises very steeply in rough uncultivable moorland covered with many boulders but generally below the road the land slopes gently at about 5-10 degrees, in places being
[240] completely flat. Here, however, the lazy-beds are very boggy and rushes have appeared in the ten years since cultivation ceased.

136 The soils are deep near the shore due to soil creep; higher up they are very thin and peat
157 accumulates to at least 3 feet both below and above the road. There is little cover; bracken is rare, but silverweed and heather, moorland sedges and grasses soon colonise disused lazy-beds.

241 Legally there are three crofts but only one is still cropped, the other two being used solely
[135] for grazing. There is, however, a cutting on the crofts as peat is secured just outside the worked as a croft. The other two crofts are used as ancillary grazings to holdings in Airidhvruach and Balsilan and have not been lived on for forty years and ten years respectively.

The chief crops are oats and potatoes, though the gamekeeper had a patch of turnips and
[240] the other croft had grown them during the last few years until 'finger and toe' developed.
[807] Patches, about half an acre in extent, are drained with stone drains and ploughed by tractor, after which potatoes are grown to clean the soil, followed by oats for one year and then sown hay for three to four years. This is not strictly adhered to and several lazy-beds appeared to be
[319] in natural hay. There is, however, a growing demand for the croft's hay from other
[291] township fences on the common pasture. Lambing has been poor for the past two years being only 50 per cent in 1958, the stock carried is twice the sheep sown. The cattle, Highland and Ayrshire or Shorthorn crosses, are below the sown, but previously nine cows and followers have been kept.

161 There has been a great decrease in population and cultivation since the resettlement in
162 1886. In Seaforthead and Shialdernish as a whole, there were twelve crofters before the

[Calbost]

134 Drift is found near the shore and lape round the three hills nearly up to the road, predominantly heavy clay with small boulders; this is replaced above the road by peaty loam on rock. At one time, here was grown on the heavy drift. There is peat accumulation on the flat land near the road to a depth of about six feet and there are one or two peat banks.
Vegetation is poor; there is no bracken or cover and within the crofts, moorland grasses and
137 sedges predominate on rough land, though there are many lazy-beds sown down to clover and cocks foot. On the hills heather predominates.

195 Habost is the oldest township in Park. In 1843 Maclennan came from Shialdernish and
592 took what are now Nos. 9, 10, 11, 12 and 13 and Alisan Tailear came from Tarasaig, Harris,
621 to No. 7. By 1886 there were thirteen crofts; in 1907 four cottars were recorded, three being there before 1886; in 1957, No. 11 which had been shared between two brothers since 1906, became legally 11A and 11B making fourteen crofts. There are also fourteen operative units although two are worked from Kershader, both as 'hay and grazing' units, and two are worked as one unit within the township, for there are three non-crofting units.

241 Only sixteen lazy-beds are dug by spade, the rest have been drained with stone drains and
409 ploughed by tractor owned by one crofter who loans it out to Habost and Kershader. There are three "Crawlerators" (land-tractors) in the township but these are only heavy enough for
293 bringing in peats, hay and similiar light work. The progressive Habost community has fenced off part of the common grazing, to keep the weaned lambs off the croft from August till November and so save fodder for winter when the croft land is open to grazing.

[248] Oats and potatoes alternate in the rotation, with a little sown grass for hay, sown in enclose
[364] parks of about one acre. The tendency now is to increase the number of parks, cut the hay in
[351] June and build up the lambs on the new grass. Shell-sand is used to fertilise the parks but
[324] elsewhere artificials, such as superphosphates, 'potato manure', potash, nitro-chalk and lime are used in addition to dung and, near the shore, seaweed. Most of the hay is taken from old lazy-beds.

251 The land is heavily overstocked: the sown is equivalent to 79 cow units, and actual stock is
255 144, whilst the figures for sheep are 191 and 618 respectively, including the sheep stocked in
[652] Park Deer Forest by seven of the Habost tenants. Sales of cattle are held at Garenin in November
[251] and May and sheep and lambs are sold in Stornoway. Lambing was poor in 1958, 50-75 per cent being general, but many breeding ewes and other sheep have died.

241 The only cultivation on the common land belongs to the unofficial holdings. Behind Craigeal however, there are some old lazy-beds, a well and ruins of a hut, which has not been used since
[311] before 1886. They used to be shielings on the far side of the common on Beinn Bhuidhe and
[324] below Loch na Ciste but these have not been used since 1888. Habost is one of the agricultural
[351] township and fishing is only for domestic use; looms are to be found on only four crofts and
[324] trade is slack. One crofter has a lorry for contracting, carrying peats, fertilisers and stock
[293] to market and two have butcher's rounds in Lochs. There are two small stores.

561 Settlement is scattered, always on elevated ground, and in many cases the new house has
[472] been built in close proximity to the old house site. All have piped water either from the well or
[654] from a rain tank, drinking water being carried in the latter case. Grants from the Crofting Commission are enabling new building and improvements to be carried out.

[Garryard] [Caversta]

At the moment Garryard appears to be a go-ahead village, carrying out communal schemes which will benefit the township as a whole. However, the age structure of the population is abnormal since 60 per cent of the population is over 45 years. The future in Garryard offers little to young people hard work, little money and no entertainment, making the attractions of the cities and industries of the mainland quite irresistible. Unless some industry can be started the future bodes ill for the area, since most crofters are of the opinion that a weekly wage packet would more than compensate the loss of their independence. Perhaps it is symptomatic of the age of National Assistance and subsidies that man cares more for momentary rewards and the luxuries of life. This is well understood by parents who encourage their children to leave the islands to seek employment either in Britain or within the Commonwealth. The Lewisman is no sentimentalist clinging to dying traditions and a way of life. His present desires have been re-cast as a result of his increasing contact with the world beyond the Hebrides and he is prepared to abandon his home where it defeats his aims and purposes. Unless prosperity can be brought in by way of industry, tourism or increased croft efficiency, possibly through co-operation in working and marketing, it is possible that we are witnessing the end of a community.

CAVERSTA

Helen Mackenzie

Caversta lies along a southern inlet of Loch Eriscort, five miles from the Minch and is partially sheltered from east winds by the Cromore peninsula and Eilean Chaluim Chille.

The physical nature of the terrain is irregular, rising steeply from the water's edge to a level of approximately 150 feet. To the west and to the south the land slopes to the sea in a gentle slope; it is here that the settlement occurs. Particularly in the north-west, two marked breaks in slope are visible at 75 feet and 100 feet above the loch, which is here bordered by a 25 foot rock face. The resulting platforms are separated by faces of bare rock. The valley of the Caversta River is a noteworthy feature. Below a small loch, the river follows an irregular course though a wide and shallow moraine-strewn depression and a quarter-of-a-mile from its estuary, has cut through some low hills, rising about 30 feet above the depression. At this point, its course becomes steeper as it passes through a small gorge, which is probably an overflow channel.

Trees are non-existent and the natural vegetation consists of Sphagnum on the peat bogs in the hollows and grasses and sedges on the gentler slopes. The steeper, less waterlogged slopes, often broken by rocky bluffs, have heather cover; bracken growth is kept in check by heavy grazing. Forty-six acres of land have been reclaimed by clearing heather and removing peat to form the crofts, but the soil, which varies in depth from a few inches to a few feet, is very acid.

The six legal crofts vary in acreage from 4.75 to 8.5 acres and a squatter has 5.5 acres of enclosed land. The township is in two parts: Toriota, with the two smallest crofts, lies at the east-ern extremity, while the other five holdings, also bounded by a dyke, border Tob Caversta, an inlet of Loch Eriscort. The crofts, which run from the shore to the township dyke, were set prior to 1861; originally the township formed part of Croberg Farm. The legal units are, in fact, operative units except that one of the Toriota crofts, now unoccupied, is used for wintering lambs by the tenantee's brother, a resident of Caversta.

There are no occupied black houses remaining in either Toriota or Caversta, as during the past fifty years new dwellings have been erected in dressed stone or corrugated iron, usually with roofs of asbestos slate, tarred felt, or corrugated iron. Several old thatched houses are now used as barns and byres.

[Caversta] [Cromore]

The 1914-18 war had a marked effect on the Caversta population - 16 out of 54 (29 per cent) left after 1914 and never returned. Since then, seven people have left to further their education in Stornoway or the mainland, (16 per cent of the total 1939 population), and six of these were from Toriota (i.e. 50 per cent of the 1939 Toriota population); only one family now remains there. The demographic position is becoming more acute for there are no young married couples and no youngsters growing up. The girls have left to marry and most of the men have sought temporary or permanent employ-ment elsewhere, for with better communications, education and the radio, the pull to the towns has become stronger. There are now only two people in the township who could be described as full-time crofters, earning no supplementary income by weaving tweed on commission from the Stornoway mills.

Caversta is not one of the most progressive of the South Locke townships. Although the crofts are fenced, the common pasture is not visibly delimited from either the Cromore or Garryard pastures. At present, the grazing is fully stocked according to the scum, but the committee has not as yet initiated any re-seeding schemes. As the pasture is not of the best quality, some newly sown grass would benefit every crofter. Lack of manpower may in part account for this deficiency but evei a small acreage of re-seeding would be a great asset.

The future position of the township is rather doubtful: it is not the best type of land for mechanisation and is badly served by communications. The future of Toriota appears to be probably one of abandonment, unless it is more easily linked with Cromore. The possibility of a good road being built here is remote, as there is only one family to serve. The main part of Caversta is also open to question. Amalgamation of the crofts would not necessarily make more efficient units for the present units are not used to their full extent. Amalgamation with Garryard might benefit the township agreed deal, as the Caversta population is rather small to flourish in isolation. The future of Garryard, Kerahader and Habost is one of hope, but unless some change takes place soon, it is not difficult to see Caversta, and Toriota, following the same course as Calbost and in thirty to forty years being little more than grazing land.

CROMORE

G. Mary Swindell, B.A., and Dennis F. Fancett, B.A.

Cromore is situated on a peninsula between Loch Eriscort and Loch Cromore. Approaching it from the access road, Cromore has the appearance of a nucleated settlement, but in fact each house is situated on the owner's croft. The crofts are so arranged that each has a portion of land on the more level surface of drift deposits; houses 1 to 20 stand at the junction of the drift and the Lewisian gneiss. Soils are poor and thin, and there are numerous outcrops of barren rock amongst the arable land. The natural vegetation is heather moorland with extensive patches of rushes and cotton grass, the pattern of most of the 'outrun' around Cromore.

The township comprises twenty-seven crofts and there are twenty-seven working units; two crofts are subdivided while another four form double crofts. In addition there are five cottars and the Schoolhouse feu. Outside the township dyke there are two feus and four squatters. The croft layout differs from most other townships as each croft is in four non-adjacent pieces, one piece around the house, another above Creag Cromore and two pieces on another area of enclosed land on the common. Two crofts on the eastern side of Loch Cromore, have most of their arable land around the croft-house while three crofts have only one share in the other area of enclosed land.

Until this decade all the land around the houses, and much of that above Creag Cromore, was regularly cultivated. Some of the lazy-beds on the higher land are being cut for hay this year but cultivation is limited to the land around the croft houses and is completely somnolescent. The only crops at present are oats and potatoes and these are usually grown in rotation. The crofters sowed

[Cromore] [Marivig]

butchers' vans call on Wednesday and Friday and a fish van once or twice during the week. Goods are also conveyed by the daily bus. Electricity was brought to the village about four years ago and the inhabitants now look forward to a supply of piped water in about two years' time. At present only three or four houses have bathrooms.

The crofts, when worked well, are good enough to provide the existing population with a satis-factory subsistence, but each family unit must have some additional source of income. It seems that the recent subsidies for fishing are good enough to attract fishermen from Cromore and one or two boats might be sent out from the bay if the quay were longer. Weaving has brought prosperity but, as the Park Association states in its Second Progress Report "there is not sufficient weaving available for the present number of weavers". The proposal to establish a spinning and processing plant in the Park District made in the 1957 Report, would undoubtedly be of great value to the people of Cromore. The village is sited in a most picturesque spot and one of the inhabitants suggested that a hotel built on Croberg Farm would bring some benefit to the community. However, even if these three increased sources of income became effective, one wonders whether they would be sufficient to attract the younger generation, already urbanised by schooldays spent in Stornoway.

MARIVIG

Pamela Gough, B.A.

Marivig is situated on the western and south-eastern sides of Loch Marivig, a small triangular sea loch opening to the north-east and sheltered from storms and swells by Torray Island, making the loch an ideal anchorage and harbour.

The land rises steeply from the shore of the loch for twenty-five feet to fifty feet, then slopes more gradually and irregularly, with frequent precipitous rock outcrops, for two hundred to five hundred yards to rise steeply to a line of low hills, two hundred and fifty feet to three hundred feet high in the north-east of the loch. All crofts thus have an easterly or north-easterly aspect, not particularly favourable for agriculture, and only one has any appreciable area of level land uninterrupted by rock outcrops. Soils, derived from glacial drift, are unevenly distributed, thin, and very stony, and cultivable areas are thus small and widely dispersed.

The surrounding hills, which form part of the eight hundred and sixty-three acres of common grazing, are mainly covered with heather, moor grass or sphagnum bog, while the lower areas within the township are grassy, but drainage is poor, and rushes are widespread. Bracken is not yet a problem, and only small areas exist, mainly on the lower slopes of the western side of the loch. A few rowans and willows survive here also, but otherwise the area is devoid of cover.

There are twenty-four registered crofts in Marivig, twenty-two being inhabited, one vacant and worked by another crofter, and one worked from a house on the common. With the exception of two crofts, one of which is on the common, all the boundaries run from the township dyke, which closely follows the two hundred foot contour, to the sea in radial fashion. (Fig. 4). The crofts vary in size from 1.25 acres to 22.25 acres but only seven crofts and less than four or more than eight acres in size. No croft has more than three acres of land which has ever been cultivated, and few have cultivated more than one acre. There are thirteen cottars and squatters, five houses being on the common, three of them cultivating small areas adjacent to their houses.

Cultivation is exclusively by spade on the 'lazy-bed' systems. Owing to the rocky nature of the terrain, the 'lazy-beds' are narrow, often only one or two yards wide. Potatoes and oats are grown in rotation, and hay taken from lazy beds left fallow. Very few crofters sow grass for hay or undergrass tillage. Dung and seaweed are used as fertilisers, with potash fertiliser as the most general 'artificial'. Small enclosed gardens, often somewhat neglected, produce lettuce, carrots, cabbage and soft fruits on about half the crofts, but no garden produce is marketed.

[Marivig] [Calbost]

In conclusion, it may be said that the problem of Marivig's future, and that of other crofting townships, is not only one of adverse aspect, soil and weather conditions, and of distance from markets, but a problem of the young people finding a stable and viable level where agricultural units are large enough to encourage the active and enterprising section of the population to remain, and a problem of finding capital to equip a modern fishing fleet.

CALBOST

Anne Cooper

Calbost is situated five miles to the north-east of Grevir on the Minch coast of Park. It occupies a basin-like hollow in the centre of which is Loch Dubh, and is open to the sea on the east. The croft houses are scattered over a shelf 50 feet above sea-level round the sides of the hollow and along the valleys which enter the township to the north and south-west.

The cultivable soil, a mixture of peat and well-drained gravelly drift, is on the higher ground, although here the rock outcrops in many places. On land formerly cultivated, bracken is spreading rapidly and now covers a large proportion of the surface, although twenty to thirty years ago it was unknown. Heather dominates the common pasture and rushes are widespread in the low-lying central area. There are a few willows and rowans round the old buildings, probably planted as wind-breaks.

Calbost was originally a single farm but the township was formed about 1820. The pattern of the crofts differs from the usual shore-to-dyke alignment, as six crofts were allotted extra land in the valley which enters from the north, when a part of the common grazing was brought within the township dyke. There are now fourteen crofts of which four are worked by resident crofters and two by squatters. The remainder are used only for hay and grazing and are sub-let to crofters in Calbost and other townships.

Cultivation is entirely by spade and of the 2.6 acres now in cultivation, potatoes account for 2.37 acres. The small acreage of oats reflects the greatly reduced cattle stock in the township and only approximately twelve acres of hay are cut as winter feed for the 225 sheep which graze in the township.

The lazy-beds in natural hay and the outrun are being rapidly encroached on by bracken. The prevalence of bracken, and the amount of work needed to clear it, is likely to deter any attempt at renewed cultivation.

Calbost was originally a fishing township in spite of its harbour being so exposed: boats have to be taken up on the shore and secured to keep moored in the bay. The decline of the fishing industry which has prevailed in Lewis has contributed towards the almost complete desertion of Calbost, leaving only a few boats now used only for leisure purposes. Croft income is supplemented by only two of the men in the township, one a weaver and the other in the Merchant Navy. Although there are a few productive gardens, no attempt is made to market any produce.

The township dyke is very close to the settlement and in the past shielings were not as widely used in Calbost as elsewhere. The cattle were instead brought near to the dyke for milking and allowed to graze on the common unattended. There are ruins of shielings to be found on the hills around Calbost but a more interesting feature is the second dyke; enclosures were made adjoining the main dyke and in the late summer the cattle were brought to fresh pastures within these dykes before the opening of the township gates. Following the opening of the gates the stock are free to wander over all crofts but there seems today to be a tendency towards the complete enclosure of the crofts.

[Calbost] [Gravir] [Glengravir]

The present situation in Calbost is best illustrated by reference to the population stati There are only 17 people living there at present, seven of whom are squatters and only eig are occupied within the dyke. Of the male population, there are three children under four one man in the 15-44 age group, three between 45 and 64 years and two over 65. This i shows the lack of active men from 15-44 years, necessary for the continuing economic su the community. However, even these figures are not so striking as the numbers of emigr no less than 39 men and 40 women have left Calbost since 1939.

A community of 120 persons has shrunk to less than 20 in only twenty years as the you people have left to find employment in Stornoway and on the mainland. The present popula structure seems to indicate a continuation of the downward trend.

GRAVIR AND GLENGRAVIR

Gravir, the largest Park township numerically in population and crofts, lies astride th east-west inlet of Loch Osirn, a glacially modified line of structural weakness. The site o township is perhaps the most picturesque in all Park; but the steep slopes, lack of cover, area of good arable land, and the considerable population existing on slim resources, prob common to Park as a whole, are all epitomised in Gravir.

On the south-facing slope above the loch and the continuation of the trough in the valley west, the majority of the crofts have been carved from moor in sea, some before 1800, an in the process of the abolition of run-rig which was accomplished in the years 1850 to 185 Originally, there appears to have been thirty crofts, but four were added during the nineto century, two at each end of the line, and in 1934 a further fifteen were cut out of the com ing, a mile to the west of Gravir. On the south side of the loch, the 'clachan' of Tom na H established about 1800, has since developed into a further nine crofts. Thus there are for legal crofts in Gravir and a further fifteen in Glengravir making fifty-eight in all.

The layout of Glengravir, a line of crofts from 3.6 to five acres, typifies the small pos Department of Agriculture holdings. The arrangement of the Gravir crofts is illustrated i 4, and it will be seen that not all the crofts are consolidated. There are three areas of fo arable common which have been lotted in unfenced strips and they may well be reclamatio were assessed on capacity to supplement the food producing capacity of the township. The method of and allocation speaks of a period when a subsistence economy under severe pressure (from population, necessitated fair shares for all. The last of these commons was in cultivation 1891. Although subsistence crofting has been obsolete since then, there is as yet no mov a regularisation of the layout.

The congestion which necessitated the reclamation of the arable commons developed m as a result of a successful fishing industry which prospered from 1860 to 1914 and at one t were two curing stations in Gravir. With relative prosperity from an ancillary industry, t were tolerated and the population rose from 197 in 1830, to 368 in 1881. The lowest point was in 1911. The collapse of the industry after 1914 began the downward trend which has certa yet ceased. Gravir reverted from 1918 to a township of agriculturists and a base for sea forth of Lewis, although there have been spasms of successful fishing activities.

Stock raising is now the function of the township and the agricultural resources and co are hardly conducive to the development of economic holdings. The Gravir and Glengravir vary between 3.5 and 26.5 acres in size: no croft has more than four acres of 'old arable' days of subsistence agriculture, and indeed until the 1930's, cultivation, all in narrow la backed up with stones at the downward extremity on the steep slopes, was much more ext All the cultivable land was at one time under crop, heavily manured with seaweed cut as far Cromore on the coast south of Kebock Head. About one-third of the maximum lazy-bed ar cropped and the more inaccessible areas of the crofts have reverted to pasture; some of t

3. *Plant Communities of the Island: Hill Moor, Peat Moss and Machar*

The types of pasture in the Island should be compared with those elsewhere. The peat moors of Lewis resemble those of northern Sutherland. The machar lands of the Uists, and of Tiree and smaller isles, surpass those of Lewis, while on the mainland and Inner Isles raised beaches provide workable, well drained soils. The 'rocky hill pastures' of our Island correspond to the rockier 'mountain pastures' and 'plateau summits' of the Highlands, and the 'fair' and 'hill pastures' of Lewis rather to their widespread 'wetter moors'. Grazing conditions are of course, similar in crofting areas alone. The edging of heather above the sea-cliffs of the Island and on the western mainland forms a picturesque element of the landscape, seen from a passing vessel, but only a narrow strip of the pastures. The plant communities shown on the Map of Vegetation (Fig. 8) must now be outlined.[1]

[134] (1) On the *Rocky Pastures* the scattered patches of soil are covered by a low and close sward, almost exclusively of perennials and grasses, such as bent (*agrostis*), common and brown, sheep's-fescue grass and wavy-hair grass (*festuca* and *Aira*); small sedges and mosses, with club moss and lichens towards the summits; heather, and fine-leaved bell-heather (*Erica cinerea*); and flowering plants like thyme, bird's-foot trefoil, tormentil and smooth heath bedstraw (*Galium*). Those rocky pastures prevail in the Forest of Harris (Plate XI).

Racially, a broadhead

[Lemreway]

vulgaris is dominant. Ling, which can tolerate considerable soil water, often occurs with Nardus, Molinia, Scirpus caespitosus and Eriophorium. A few rowans, usually near the shore, and a few willows, usually within stone enclosures, are the only trees to be seen.

Of the thirty-three legal crofts in Lemreway, nine comprise less than five acres, while seventeen are between five and ten acres. Of the remainder, only two exceed fifteen acres and one of these is 30 acres. Six unoccupied crofts are worked by persons other than their tenants, so actually the 290 acres of croft land are shared by twenty-seven holdings. The seventeen-acre 'outend' was originally divided between fifteen tenants but confused sub-letting has resulted in four separate holdings directly occupying nine acres, and working another four acres. Thus the outend today must be regarded as the monopoly of four 'unofficial' holders.

Little more than a quarter of the croft land is cultivable and even less is actually cultivated today: Figure 9 illustrates the crofting year. The broken terrain and the stony nature of the soil has permitted the cultivation of tiny 'lasybeds' and the total cultivated area is now about 48 acres. Only the strips of land on the gentler slopes, where the soils are deeper, are now cultivated, but every croft shows signs of former, more extensive, lasybed cultivation, often covering at least two acres. For example, on the east side, natural hay is cut on the well-marked lasybeds at about 225 feet.

Oats and potatoes, 29.5 and 16 acres respectively, occupy almost all of the cultivated ground. Most crofts grow about half an acre of potatoes and one acre of oats; both acreages have declined, the former with a declining population and the latter with a reduction in the numbers of cattle; hay has increased in importance. No bere is now grown, though before 1900 it was preferred to oats. Ruins of the bere mill, which ceased to function at the beginning of the century, can still be seen. Fifty-nine acres of natural grass are cut for hay but only four crofters had sown grass for hay in 1958, about three acres in all. Few vegetables other than potatoes are grown though carrots are said to grow well, and formerly turnips and cabbages were grown. The soil needs careful preparation to be productive and almost every crofter used some seaweed and at least twenty drew subsidies for lime and artificial fertilisers in 1958.

Stock totals have declined recently but the township has 36 cows and 22 calves. Only one croft is without cattle and 22 of the 33 working units have a cow and a calf. The township has an Ayrshire bull on loan from the Department of Agriculture; one of the few remaining elements of the co-operative township system is that this animal is fed by the crofters, in rotation, during the winter.

All but two crofters keep sheep; stocks vary between ten and 120 per holding but the majority have about 23 ewes with ten lambs. Although numbers have declined recently, the 3,025 acres of very moderate common pasture support a flock of about 1,150 sheep, including about 650 breeding ewes and about 300 lambs.

The souming is not enforced in Lemreway and it is remarkable that the total stock tallies almost exactly to the souming. An examination of the sheep soum reveals that the stock of 917 (excluding lambs) considerably exceeds the sheep soum of 626. It is interesting that it is nearly always the working units of over 10 acres that are overstocked; of twelve such units, eight keep more sheep than they are entitled to. Most of these crofts are grouped on the eastern side of the township where the crofts have a larger outrun.

Thus, while overgrazing is not so severe as in many townships, it represents a potential threat, particularly if the common pasture is not improved. However, in 1958 ten acres of the common pasture have been enclosed and re-seeded. Six acres were sown with ordinary mixed grass seed, two acres with pelletted seed and two acres with pelletted and inoculated seed. The eleven crofters taking part in the scheme put on 100 tons of sand to help drain and aerate the peaty soil, 2½ tons of rock mineral phosphate and 1 ton of concentrated compound fertiliser, grades 1 and 2 - all of it by hand. The area was sown in May 1958: by the following August, there was a striking difference between it and the untreated pasture. Next Spring, eleven cows will be grazed on this area. With the success of this scheme, it is hoped that more of the crofters will co-operate in re-seeding further areas.

[Orinsay]

which rises steeply, exceeding 375 feet in the west and 150 feet to the north and east. From the north-west and north-east two glacially deepened valleys drain southwards, their lower ends being "drowned" by northward extensions of the loch.

Although peat covers most of the surface it is only in the hollows that it is significantly deep, for even on the gentler slopes the peat cover is frequently so thin as to expose a layer of morainic sub-soil containing many stones and boulders.

Two rowans and a dozen willows represent the only tree growth, but tree stumps frequently exposed in peat-cuttings suggest that woodland was formerly more evident. Whether this former woodland disappeared as a result of human action or of climatic change it is not possible to say, but it is certain that a century of overgrazing has not favoured natural regeneration. Moorland grasses, sedges and a little poor heather characterise much of the area, and reflect the poor grazing capacity of much of the moorland. Bracken has established itself in one limited area on a patch of neglected croft land.

Orinsay is unique in Park, for the present township is entirely a twentieth century development. In the early 19th century there was a settlement at the head of the loch, but in 1843 the residents were removed and the area enclosed and added to Crobeg sheep farm. In 1916, there was a proposal to establish fourteen crofts, but the applicants were requested to wait until after the war. At the end of the war the return of many young men with a desire to settle down led to serious overcrowding in Lemreway. Several of them 'raided' the Orinsay area. At first living in huts, they built their own houses, and in 1922 the Department of Agriculture intervened, recognising and fencing off fourteen legal crofts, and at the same time providing a good footpath. Seeing the success of their neighbours, four other Lemreway families, comprising 26 people, went to Diesmreway, about a mile to the west of Orinsay. Here, however, the Department of Agriculture did not intervene and with the community remaining isolated, most of the settlers returned to Lemreway within three years, although one family remained until 1939.

Six of the crofts have an area of less than ten acres, six have between ten and fifteen acres, while the remaining two occupy twenty-five acres: the largest croft originally belonged to the shepherd on the sheep farm. Three of these crofts are not occupied, although worked by other crofters, with the result that eleven operative units share 161 acres.

Only a small part of the croft acreage is actually cultivable: even less is cultivated in practice. The broken and rocky terrain combined with the peaty soil allows nothing but the cultivation by spade of tiny lasy-beds. The total area now cultivated does not exceed 25 acres, although in the past it may have been nearer 40 acres.

Oats and potatoes are the staple crops, occupying 9 and 6½ acres respectively in 1958. Individual croft acreages of these crops vary in relation to the requirements for winter stock-feed, and in the case of potatoes, to domestic consumption. Nevertheless to produce even these meagre returns the soil requires careful preparation. A plentiful supply of seaweed is obtained from the shore and is the most frequently used fertiliser, while a little sulphate of ammonia is applied. Only two crofters use lime.

In the last two decades a marked reduction in the amount of oats grown has accompanied a decrease in the numbers of cattle and an increasing use of hay for fodder. Nevertheless only about 17½ acres of hay altogether are cut, and only five of the crofters sow any grass seed.

In August 1958, the township supported only 13 cows, 3 young beasts and 8 calves. Half of the crofters have a cow and a calf, but three have no cattle at all, and one uses used condensed milk. A sad commentary on the state of crofting in Orinsay, but a phenomenonby no means uncommon in crofting areas.

the northeastern end of the peninsula is covered by glaciated, rounded hills rising to 2,396 feet. The remainder is a low-lying area of soft rises and deep glens. The soil cover is largely no more than a physical zedium. Were it not for stoney but light, well drained soils on several raised beaches and morainic soils derived from the mainland, large parts of Sleat would have no cover other than ice scoured rock. Peat covers many of the flatter facets.

Despite the multiformity of the physical appearance of the island, one cannot help forming the impression of a certain sameness. Except where bare rock stands out in stark relief or where man has laboriously turned the soil to agricultural use, the flora of Skye is primarily grass only occasionally interspersed with a few trees. In the glens and on the lower slopes of the hills fescue and bent grasses are found wherever the natural drainage is good. Both are tender and excellent for pasture. Poorly drained land supports coarse sedges and rushes. Above 300 feet moorgress is found on dry facets and rushes and mosses on soggy ground. The high hills, such as the ridge of Trotternish, maintain a sub-alpine pasture of small flowers, mosses, and sparse grass. Obviously, the main factors governing the natural flora are drainage and altitude. Man and his stock have also influenced the vegetation. Selective grazing by sheep has allowed the spread of a large, tough fern, called bracken, which has markedly reduced the pastoral value of extensive tracts of the best land. Another common plant is heather. True heather moors, however, are

exceptional. The largest is found in the glen between Portree and Loch Sligihan. Of the total area of Skye, approximately 447,000 acres, over 400,000 acres are rough grazing, incapable of being tilled.

The scarcity of trees is an environmental feature worthy of special consideration. More than the mere aesthetic appreciation of the traveler is involved. The lack of shelter is a crucial factor in limiting the variety of crops which can be grown. There are three "forests," but they are deer forests without trees and with very few deer. Wooded areas exist only where landlords or, more recently, the forestry commission have planted for amenity, shelter, and anticipated lumbering operation. Pollen analysis from an archaeological find,[7] and stumps, discovered in peat bogs,[8] suggest a once widespread natural forest of birch, hazel, elder, oak, and pine. All that remains are a few small areas of birch and hazel on peat-free slopes and on sheltered escarpments beyond the reach of the cattle and sheep, and some residual oak woods in Sleat. So sharp is the contrast of Sleat with the rest of Skye in so far as vegetation is concerned that this peninsula has come to be known as "The Garden of Skye." The proprietor has played his part in the creation of this impression by

[7] James Hitchie, "A Keg of 'Bog Butter' from Skye and Its Contents," Proceedings of the Society of Antiquarians of Scotland, LXXV (1941), pp. 5-22.

[8] F. Fraser Darling, "The Ecology of Land Use," The West Highland Survey, pt. IV, p. 7.

planting birch, hazel, oak, juniper, larch, spruce, and short pine. These are the usual trees found on the plantations. Typically, the Sgiathanach prefers an unobstructed view to trees. He may tolerate a mountain ash or elder near his house, but he has little desire to be surrounded by woods.

The Climate of Skye

Lying in the temperate marine climatic zone and influenced by the Gulf Stream, Skye is noted for its mild winters and cool summers. The annual mean temperature range is between 14 and 16 degrees. Temperatures above 70°F. and below 40°F. are exceptional. Although frosts may be expected from October into May, severe frosts are uncommon. In recent years there have been two, one in 1954 and one in 1947. The climate is not, however, to be considered moderate. The spring is not appreciably warmer than the winter. With a maximum noon temperature of 68°F. for August of 1953 (Struan), it is hard to believe that summer exists as a season. Economically, these climatic features mean that the planting and growing season is late and pasture growth is slow.

The outstanding characteristic of the climate is the amount of rain. Rainfall varies from considerable to excessive, depending on the locality and the year. The rainbearing winds blow in from the south and southwest. Thus, in the lee of the Cuillins, Red Hills and the ridge of Trotternish, the annual rainfall approaches 80 inches. The driest area of Skye, northwestern Trotternish, has an average annual rainfall of

141

141 ANTHROPOMETRY--mean, range, and sex distribution of physical measurements (e.g., stature, weight, span, length of limbs); indices (e.g., cephalic, nasal); etc. See also:
Features . . . . . 816 Conception of ideal bodily proportions . . . 826

174 613 of the Norsemen, lay a succession of earlier periods. A phase of primitive settlements is traceable in archaeo-
172 logical remains and in recent and contemporary survivals.
174 It is shown in the physical race-traits distinguishing those in one part of the Island from those in another. Fragments of tradition telling of the first Christian missionaries survived the Norse invasions and settlements, dated from A.D. 800 or before, down to Haco's defeat on the Clyde at Largs in 1256. These fragments can be linked to chronicles and to later tradition, on which they throw fresh light.

(144) A survey of the archaeology has been published,[1] but comparatively little, as yet, on race. Yet different communities are distinguished by marked racial types or strains. Although many, indeed most, of the race-strains of the Island must have entered it in prehistoric times, some are linked to tradition, and history accounts for the more
• (141) recent immigrants. The striking element of race in the Outer Hebrides is a broad-headed type prevailing from Barra to the Lews, accompanied by medium stature and dark hair; it is also found across the Northern Minch. But within the Island are notable differences.

829 Variety of race being accentuated by difference in ways, the communities still comment pointedly upon one
(538) another! For instance, an old saying is not forgotten: "The folk of Cladach, but the gentlemen of Uig!" (*Muinntir a' Chladaich, ach daoin' uasaile Uig*),
(433) 'Cladach' being the western 'Beach' district possessing
(632) ploughland but poor fishing, which covers the modern
(133) parish of Barvas (excluding the north-west cliff-promontory

(113) [1] Royal Commission on Ancient Monuments, *Outer Hebrides, Skye* etc.); 1928. V. G. Childe, *The Prehistory of Scotland*, 1935; *Scotland Before the Scots*, 1946.

829 of Ness), while Uig is the most westerly promontory with
(433) its natural fishing harbours. The authorship of the pro-
(632) verb may be ascribed to the ladies and gentlemen of Uig;
(133) yet the personal appearance of the victims, who are more broad-headed, gives the proverb a physical foundation.
174 Again, the tall men of Ness, dark or fair, and rather longer-
172 headed, still form a group apart from those of Cladach,
174 each having taken root in prehistory, *i.e.* earlier than
• 141 surviving record.
144 Such facts correct several current misconceptions as to race and heredity in their relation to Gaelic society, past and possible. First, it is still common to contrast a 'Celtic' with a 'Norse race'. Now, Norse immigrants belonged to several races, and when they arrived, several race-streams were already mixing and eddying in the Isles. After the immigration of Norsemen, the next recorded was in 1611, consisting of gentlemen-tacksmen from Kintail and burghal settlers to Stornoway, who were composed of Gaelic-speaking families from Easter Ross, where the people of today resemble some Scandinavian types rather than typical broad-headed Lewismen.

Second, it follows that no sweeping generalisations can yet be made as to the ways and habits of particular races. The "Celtic race", one reads, have "never taken to the sea" as have the Norsemen.[1] The facts in the Island are that though the men of Ness, with a possible Norse admixture, were considered better fishermen than those of Cladach, and the present generation includes a great number of seamen, their opportunities have been greater —their cape commanding wider fishing grounds and their little port providing relative safety in storm. And the men of Lochs and of the 'Bays' of Harris, though they show

[1] For example, in the Brand Report on Lewis (1902).

144 little sign of Norse blood, can hold their own as fishers with
172 the men of Ness.
174 Third, it is still commonly stated not only that the "great majority" under the clan system were "without
174 any legal status", but that their tenure "depended on the
(613) good will of the chief or tacksman".[1]

As the last lawbooks of the Gael were taken from Lewis
174 by its first mainland lord in 1611—never to be heard of
675 again—it may well be that, as recognised in the Northern Isles, so in the Western Isles, peasant tenure was perma-
(175) nent according to regional law. In practice, mere 'good-will' is so uncertain a quantity that if this statement had been true, it is hardly credible that communities could have remained so stably rooted as their race-types show them to be. Evictions of groups or individuals at the whim of chief or tacksman would have broken down their
(178) homogeneity of race. In the Lowlands, where eviction
(184) had become so frequent by 1500 and insecurity for the mass of the country people has prevailed ever since, such localisations of race would be unthinkable and do not exist except in certain fishing communities who possess a pride, almost a caste-code, of their own: the Newhaven fishers within Edinburgh remain apart, with a dialect and a dress of their own. Great stability of tenure—in fact as in customary claim—is shown by the racial homogeneity of Gaelic communities.

174 Lastly, it is common to state that the nobility and gentry of a countryside constitute its 'old' or 'original' families. It is true that some land-owning families seem 'old' compared to recent purchasers—successively the merchants and lawyers, venturers and planters of the

(113) [1] From a representative report on the Highlands and Islands, that of the Scottish Economic Committee, 1938 (Historical Preface, p. 9).

142

142 DESCRIPTIVE SOMATOLOGY--color of skin, hair, and eyes; form, length, and distribution of hair; musculature; secondary sexual characteristics; somatotype data; etc.

[Gr-vir] [Glengr-vir]

beds are now covered by sphagnum moss and heather. Other lazy-beds are permanently in natural hay; only thirty per cent of the land classified as 'old arable' is now in oats and potatoes. If natural hay is added, one hundred and thirteen acres of crops are taken from an area greater than the so-called old arable; this suggests that the cultivated area was pushed beyond the limits of the old arable (ninety acres) after 1850-52. As in all the fishing townships the area of sown grass is infinitesimal for only four of the fifty-eight operative units actually sow grass. The wintering capacity of the crofts could be greatly increased by the general adoption of the practice of under-sowing.

There are forty-three legal crofts in Gravir but nine are sub-let, in every case to relatives. All the crofts are taken up and there is evident pressure of population on the land. In addition to the crofts, there are a further ten cottars, and squatters and feuars, besides the fifteen legal Glengravir crofts (ten operative units) which have no share in the Gravir common. The common has been encroached on by several feus for Gravir is the functional centre of Park: the Free Church of Scotland and Manse, the doctor, one of the two district nurses and two of the missionaries (assistant ministers) are all located in Gravir.

Gravir and Glengravir thus have fifty-eight legal crofts and fifty-six operative units. Less than half of the crofts with grazing rights are fully stocked and one quarter have under fifty per cent of the soum, including five without any stock. The common pasture of 2,652 acres is in general of poor grazing quality, dominated by the less nutritive species of grass and poorly drained. In 1957, a ten acre plot was fenced and re-seeded: only twelve of the operative units participated in this reclamation work, and the ages of the participants ranged between 27 and 58 years; this is significant as aged tenants are unable to carry out such work. This scheme could be extended annually; if potential improvements to the crofts are limited, pasture amelioration is virtually without limits. Re-seeding on a large scale would enable better stock to be kept rather than greater numbers; at present the sheep stock is over two hundred per cent of the sheep soum, and a ewe and lamb sell for as little as £2 10s to £3 10s, an indication of the consequences of over-stocking. The cattle stock is below the souming and this paucity of cattle is one of the notable changes in the agriculture since the 1930's for at that time as many as six cattle were kept on the larger crofts. The total stock kept in Gravir and Glengravir exceeds the souming by thirty-five per cent.

The great majority of the crofts can certainly not be considered economic units. Judging from the souming of one cow and follower and eight sheep per pound sterling of rent in a township where only seven crofts pay more than £2 rent, they were never intended to be self-supporting agricultural units. The produce of two cows and sixteen sheep, with potatoes, and in former days, bere or oats, locally milled by the three Gravir water mills, could scarcely ever have maintained a family. Fishing was the complementary economic activity, and in 1901 no fewer than nineteen boats and eighty-nine fishermen were registered at Gravir. Today, only one boat fishes commercially for lobsters.

If agriculture is singularly unrewarding, weaving occupies six of the males of insurable age and service occupations a further ten males and five females, but neither weaving nor service occupations are sufficiently available or attractive to keep the insurable population in the district. Twelve of the males between fifteen and sixty-four years take seasonal employment and forty-six are in permanent employment furth of Lewis, in all sixty per cent of the potential male resident population.

The economic problem of Gravir, in common with the other 'fishing' townships, became acute after the fishing industry collapsed after 1914; in the hey-day of the fishing most of the men fished all the year round, locally and on the west and east coast of Scotland. Earnings fluctuated but a man might make as much as £90 in a good year or as little as £5 in a poor year. Apart from the sal of young cattle, and wool surplus to home spinning requirements, the fishing earnings constituted the bulk of the croft income. Today, on the basis of the souming, the income of the largest croft including subsidies could only be approximately £150 excluding the amount to be set aside for home consumption of potatoes and milk.

[Gravir] [Glengravir] [Lemreway]

The urgent need in Gravir is a reduction in the number of holdings. A pre-requisite of such reorganisation would be the creation of employment for a non-crofting population. Weaving and fishing are the more obvious occupations; the former is subject to world trade fluctuations but the latter is now in a more favourable position since the introduction of the herring fishing guaranteed subsidy, although the raising of the initial capital for buying and equipping boats is a formidable problem. It is clear that a division of the community into a crofting and non-crofting sector is essential if the present population level is to be maintained. The most serious aspect of the present trend is that the migrating section of the community comprises the younger and more enterprising people. Unless holdings of economic size can be formed, and stable employment introduced, one can expect the younger men and women to remain in Gravir.

Until a major reorganisation of the crofts is carried out, a vigorous attempt to re-seed large areas of the common pasture and the three former arable commons, and the development of a croft-tourist industry, are interim possibilities. It is not sufficiently realised in crofting districts that there is a demand from the city dweller for simple accommodation and good plain fare in a clean atmosphere, with the possibility of hill walking and fishing on fresh and salt water. Yet, until the proposed water-scheme becomes a reality, tourism on a moderate scale can hardly be contemplated.

One can only conclude that until reorganisation takes place and transforms Gravir into a township of viable agricultural holdings, any stabilisation of the present trends is out of the question. A decline in the number of holdings is inevitable in the long run but a planned reduction over a number of years would bring about a more viable community than the disintegration which will occur without such planning. Until this is achieved, the young men and women have little incentive to remain in Gravir.

LEMREWAY

Beth Blowers, Brenda G. Turner
and John E. Wearmouth

Lemreway, the southernmost township of Park, comprises 290 acres arable and outrun divided into thirty-three crofts and 3,025 acres of common pasture. The township is situated on the northern side of Loch Shell round a bay in the shelter of Eilean Iuvard.

The township consists of three distinct areas. A flat, poorly drained area at about 100 feet, part common pasture and part reclaimed as extensions to the crofts, locally known as 'the Outend', forms the first subdivision. The second area, further west, is of a hummocky nature. To the east, a steep slope rises to an altitude of 400 feet, less than half a mile from the loch shore, forming the third. Two benches are to be seen at about 100 feet on the steeper slope and similar, though wider terraces occur at the same height to the north. It is suggested that the flat area is the bed of a moraine-dammed lake, and that the hummocky sector is partly morainic and partly ice-eroded rock exposures. A channel eroded through this sector allowed the lake to drain southwards leaving a relatively deeply incised valley through which the present stream flows to the sea.

Soils may be divided into two types - a peaty loam and the better drained gravelly loam which is found to the east and along the main stream; the latter is particularly suitable for potato cultivation.

Except on rocky outcrops, the very steep slopes and the drained areas, blanket bog predominates. Sphagnum here is rarely dominant but where the land is badly drained Deer's hair grass (scirpus caespitosus) and cotton grass (Eriophorum vaginatum and Eriophorum angustifolium) are the dominants. On slightly drier land, purple moor grass (Molinia caerulea) and mat grass (nardus stricta) are abundant. Local dominants are bog asphodel (Narthecuim ossifragum) and cross-leaved heather (Erica tetralix) with other common species such as the sundews (Drosera rotundifolia and intermedia), butterwort (Pinguicula vulgaris), Juncus sp., Carex sp. and Carex panicea occurring sporadically. Where the peat has been cut and drained, 'heather moor' usually develops and Calluna

Glasgow, between 7s and 10s per stone. For tweed made on the 439
island, 27d to 30d was received per yard; for blanketing, 28d. 435
Cloth was measured by the 'big yard', which was 49 inches. The
factor bought cheese at 78d per stone of 24 lb. The prices paid
by the islanders for commodities imported included 25s per boll
for meal and oats; 3s per cwt for salt; 7d for coarse sugar; 5s
per lb of tea; whisky cost 4s per bottle; and tobacco was 5s per
lb. Leather for soling boots cost 24d per lb; for uppers 27d.
Bonnets for the men were 4s each; cravats, 3s. Physically, the 142 •
islanders were in good condition at the time of the *Flirt*'s visit,
with an average height of 5 ft 6 in, though they showed a ten-
dency to flabbiness. The prevalent illness was rheumatism, with 164
dyspepsia running a close second.

194 of the Norsemen, lay a succession of earlier periods. A
613 phase of primitive settlements is traceable in archaeo-
172 logical remains and in recent and contemporary survivals.
174 It is shown in the physical race-traits distinguishing those in one part of the Island from those in another. Fragments of tradition telling of the first Christian missionaries survived the Norse invasions and settlements, dated from A.D. 800 or before, down to Haco's defeat on the Clyde at Largs in 1256. These fragments can be linked to chronicles and to later tradition, on which they throw fresh light.

• [144] A survey of the archaeology has been published,[1] but comparatively little, as yet, on race. Yet different communities are distinguished by marked racial types or strains. Although many, indeed most, of the race-strains of the Island must have entered it in prehistoric times, some are linked to tradition, and history accounts for the more
[141] recent immigrants. The striking element of race in the Outer Hebrides is a broad-headed type prevailing from Barra to the Lews, accompanied by medium stature and dark hair; it is also found across the Northern Minch. But within the Island are notable differences.

829 Variety of race being accentuated by difference in ways, the communities still comment pointedly upon one another! For instance, an old saying is not forgotten:
[538] "The folk of Cladach, but the gentlemen of Uig!" (*Muinntir a' Chladaich, ach daoin' uasaile Uig*),
[433] 'Cladach' being the western 'Beach' district possessing
[637] ploughland but poor fishing, which covers the modern
[133] parish of Barvas (excluding the north-west cliff-promontory
[113]

[1] Royal Commission on Ancient Monuments, *Outer Hebrides, Skye* etc.); 1928. V. G. Childe, *The Prehistory of Scotland*, 1935; *Scotland Before the Scots*, 1946.

829 of Ness), while Uig is the most westerly promontory with
433 its natural fishing harbours. The authorship of the pro-
637 verb may be ascribed to the ladies and gentlemen of Uig;
[133] yet the personal appearance of the victims, who are more broad-headed, gives the proverb a physical foundation.
194 Again, the tall men of Ness, dark or fair, and rather longer-
172 headed, still form a group apart from those of Cladach,
141 each having taken root in prehistory, *i.e.* earlier than
• 144 surviving record.

Such facts correct several current misconceptions as to race and heredity in their relation to Gaelic society, past and possible. First, it is still common to contrast a 'Celtic' with a 'Norse race'. Now, Norse immigrants belonged to several races, and when they arrived, several race-streams were already mixing and eddying in the Isles. After the immigration of Norsemen, the next recorded was in 1611, consisting of gentlemen-tacksmen from Kintail and burghal settlers to Stornoway, who were composed of Gaelic-speaking families from Easter Ross, where the people of today resemble some Scandinavian types rather than typical broad-headed Lewismen.

Second, it follows that no sweeping generalisations can yet be made as to the ways and habits of particular races. The "Celtic race", one reads, have "never taken to the sea" as have the Norsemen.[1] The facts in the Island are that though the men of Ness, with a possible Norse admixture, were considered better fishermen than those of Cladach, and the present generation includes a great number of seamen, their opportunities have been greater—their cape commanding wider fishing grounds and their little port providing relative safety in storm. And the men of Lochs and of the 'Bays' of Harris, though they show

[1] For example, in the Brand Report on Lewis (1902).

• 141
144
172 little sign of Norse blood, can hold their own as fishers with
the men of Ness.
174 Third, it is still commonly stated not only that the "great majority" under the clan system were "without
174 any legal status", but that their tenure "depended on the
[613] good will of the chief or tacksman".[1]

As the last lawbooks of the Gael were taken from Lewis
174 by its first mainland lord in 1611—never to be heard of
675 again—it may well be that, as recognised in the Northern
[175] Isles, so in the Western Isles, peasant tenure was permanent according to regional law. In practice, mere 'good-will' is so uncertain a quantity that if this statement had been true, it is hardly credible that communities could have remained so stably rooted as their race-types show them to be. Evictions of groups or individuals at the whim of chief or tacksman would have broken down their
[178] homogeneity of race. In the Lowlands, where eviction
[184] had become so frequent by 1500 and insecurity for the mass of the country people has prevailed ever since, such localisations of race would be unthinkable and do not exist except in certain fishing communities who possess a pride, almost a caste-code, of their own: the Newhaven fishers within Edinburgh remain apart, with a dialect and a dress of their own. Great stability of tenure—in fact as in customary claim—is shown by the racial homogeneity of Gaelic communities.

174 Lastly, it is common to state that the nobility and gentry of a countryside constitute its 'old' or 'original' families. It is true that some land-owning families seem 'old' compared to recent purchasers—successively the merchants and lawyers, venturers and planters of the

178 found in a Lewis village; but in the ten to twenty years
462 before 1939, the so-called 'Harris' tweed industry spread
283 enormously in Lewis, accompanied by the construction of
286 large spinning mills in Stornoway which supply yarn to male weavers. One further activity, kelp-making, was
221 important for a time, although—not being strictly a
824 traditional task—it is not represented in the upper graph,
178 nor yet in the lower one, having declined after 1825 and disappeared (in the Island) long before the present century. Such was the annual rhythm of seasonal labour prevalent during the last generation, and a hundred years before.

7. *Rural Changes in Diet, Dress and Inter-marriage, and in Mobility: 1919–39*

178 Many outward changes occurred in the twenty years
262 after the close of the First World War. Till the Island
• 146 was able to benefit from the commercial advances of the mainland, it had no adequate relief from the famines of early times; in recent years the quantity of food has been
[199] rather more adequate. With the import of new foods, the consumption of vitamins at first declined: there was greater consumption of white bread from Glasgow and less of fresh vegetables (as ruined garden walls bear witness), and less, too, of cod-liver oil with the cessation of cod-
[244] fishing. Latterly, fenced gardens with vegetables and lettuce are providing vitamins, and fresh fruit (unobtainable even after 1919) is commonly on sale all the year round, so that a more rational dieting, when it can be afforded, is tending to recover lost ground and perhaps more.[1]

763 relived and shared. The person's exact age and the
764 identity of his closest kin are discussed. A van is
574 immediately dispatched to bring benches from the church,
[493] which are set up throughout the house of the deceased,
and over the next few days a constant stream of visitors
[431] fills the benches. The visitors bring tea, sugar,
biscuits and other provisions for the days and nights
of communal trial. The tigh fhaire, "house of watching,"
as this wake is called, continues until the day of the
funeral.

764 In the past, persons sat up all night with the body.
[825] "It took so long to get a coffin. You didn't want to
[178] go in and find half the face eaten away by rats." This
custom is dying out, but lights are usually left on in
the room in which the coffin is placed. When an all-night
wake occurs, the atmosphere is one of relaxed story-telling
and the sad laughter of reminiscence.

764 At least two nights of "waking" usually precede the
574 funeral. During this time, hundreds of villagers attend
[152] the tigh fhaire. Grief is expressed throughout the vast
network in which the dead person was enmeshed. On rare
occasions when a single night precedes burial, the house
is filled to overflowing.

Throughout the day and evening, waves of newcomers
enter, and other sitters slip quietly away. Kinswomen of

764 the deceased or the remaining family assist in preparing
574 endless cups of tea, using the provisions that are
brought by the visitors. The newcomers enter, exchange
greetings, memories, sighs and moral judgements in
rapid whispers. "Och, och... that should teach us,
we're all going to go. That's how it was meant to be.
It makes you wonder why we live at all, well, well."
They recall other deaths. "That was a bad death. His
liver was bad, and he turned yellow, then all black..."
[152] They weep, circumspectly observe the appearance of the
[198] room and its occupants, and speak only in Gaelic, the
language of hearth and heart.

The minister usually attends a prayer meeting which
764 is held in the tigh fhaire around midnight of the night
793 before the funeral, but his presence is not necessary.
The prayer meeting may be conducted by the elders. The
elders may also hold the service which precedes the
burial. The minister may walk for a short distance in
the funeral procession or speak a brief few words at
the graveside, but his role in the community drama is
minimal.

764 At least one person from all households within the
621 village is expected to go to the tigh fhaire of someone
592 who has died within the village, "to show respect." The
male head of the household is expected to attend the

683 discovered on many occasions. I once entertained the thought
183 that its absence was indicative of a decadent culture. Then
157 I discovered that it was a traditional norm of behavior. Only
once during the modern period has there been any aggressive
behavior, during the closing years of the "Clearances." Some
who remember these "old warriors" who were not afraid to stand
up for their rights wonder why their descendents have changed.
[793] Today only the ministers are aggressive in their dealing with
their congregations, and they reserve their aggressive pose
for their Sunday sermons. Naturally, the people quarrel among
themselves and a couple of drunken men may come to blows with
each other or the policeman who interferes. In any group
situation or in any dealings with outsiders, however, dislike
or resentment takes the form of placid resistence. The Islander
683 remains courteous and suffers in silence. This is "affect
183 suppression," resultant from Protestantizing the crofters.[39]
157 Even the talkative individual, unless he stands among the gentry
626 or has achieved prestige status through his profession, is
considered an eccentric. He must stand the snickers of the
group and bear the title of a "worthy," a man who does not act
his age.

152 Real anger, manifested by a loud or quavering voice, or
626 table pounding, clenching one's fist or other recognizable signs,
156 is not characteristic of the Sgriathanach in public. The man who
forgets himself is always taken in hand by the minister, an old
man, or a teacher. He may feel righteous indignation, but if he

[39] I am indebted to Conrad Arensberg for calling my attention to this fact.

becomes too worked up, he is expected to withdraw. On occasions 152
such as weddings, when all have had their share of the uisge 156
beatha (water of life), there may be heated quarrels, including 626
the raking over of old clan feuds. Again, some older man will
take the offender in hand, "It's not you that's talking, Murdo,
it's the drink." The man almost invariably expresses regret
for his outbreak later. Political meetings, often explosive
situations in a democratic country, may involve some heated
debate, but the code of diriquette is never breached. When one
politician told the Kilmuir crofters that something should be
done to stop depopulation because soon they might not have
any young men for the army, the people were indignant, but
they remained quiet. In the case of the cattle thief,
cited above, no one lost his temper. In fact, the matter
was discussed almost in a monotone.

People still talk about the one outstanding example of
aggression which has occurred recently in Portree. At the
end of World War II, a collection was made for the benefit of
the returning servicemen. A public meeting was held to discuss
what would be done with the money and who was eligible to
receive a gift. Two young men, both of whom had spent several
years in a German prison, and had been drinking, became
boisterous. They accused the committee of spending the money
and trying to cover it up. The chairman left the meeting. His
replacement, a newcomer, restored order by threatening to call
a policeman, something which never had been suggested at a
public meeting. The boys were forgiven because they had been

German prisoners and must have had a terrible experience, and 152
anyone knows the uisge beatha brings back memories. 156
626

Gossip

Social control does not always take such dramatic forms 626
as those we have been considering. Infringement of the
traditional norms is deterred, and deviation from the expected
patterns of behavior are censured, by a more informal tech-
nique, namely gossip. It is not an exaggeration to say that
everyone within each neighborhood knows his neighbors inti-
mately. They know the individual, his family, and his
ancestral stock. They are aware of his activities inside and
outside his cottage, the way in which he meets his moral and
religious obligations, and his general outlook on the world.
The villagers are equally aware of the character and behavior
of one another. Further, almost all the crofters who have
dealings in the village know and are known by the villagers,
at least by reputation. If any individual is not known,
personally, it is relatively easy for a person to find out
all he wants to know from another villager. To remain a mystery
is dangerous; it begets resentment. Any new arrival to the
island, other than a tourist during the summer, soon becomes
known in the local area. If he is an important person, his
arrival and departure are heralded across the island.

Gossip has enough emotional force on Skye to deter
deviations by the native and to mold the newcomer's behavior
to no small degree. It has been known to make people so

worship. If the deceased is a Sgriathanach, the minister will 793
call every night, if he can. Otherwise, he may call only 764
once. His participation in family worship helps to refocus
the patterns of interaction within the nuclear family and
within the small circle of "people," "friends," and neighbors
who come to visit and take part. Some sophisticated villagers 184
take this opportunity to justify their own deviations, such 349
as going to a concert; for them this is all "a religious ceilidh
with all their psalm singing, praying, and greeting." The 152
people do not keen, as they do in Ireland, but the women are 562
seldom dry-eyed. Again the villager may comment that the
minister at least should say a few kind words about the dead,
"just to comfort his family."

On the day of burial a second and more inclusive rite of
intensification is held. On this occasion the function of the
minister, often aided by an elder, is to restore the equilibrium
within the total sphere in which the deceased habitually moved
during his life. If the person had high prestige status, the
ministers of two churches conduct the family worship. All
the "people," "friends," and neighbors, both men and women,
attend. The minister begins with a prayer for the family,
asking God's guidance. This is followed by the singing of a
few verses of psalm by all who have gathered. Next the minister
reads from Scripture. He concludes with another prayer for
the family. If there are two ministers, or a minister and
an elder present, they alternate in leading the group. If
there are any present who do not "have the Gaelic," they
also alternate between English and Gaelic. We have seen how 764

Lewis and Harris

827 Islanders themselves sometimes talk of a lowered stamina and poorer health today than in the past. In-
178 breeding is widely held to account for this. Even if health
582 be really poorer, this explanation is untenable, since marriage outside the village has greatly increased in the
166 last century. Everywhere there is movement along the roads; a school placed half-way between two villages
[871] fosters early acquaintance; immigrants trickle in from the mainland, and emigrants occasionally marry beyond the Island. Moreover, the people of certain villages were transplanted in large numbers eighty years ago, as from
• 143 Valtos, Uig, northward to Shawbost. In any case, inbreeding itself does not produce degeneration; for though it may "fix" or bring out harmful tendencies where there is already some poor or dangerous strain, it can also fix good characteristics in a healthy population.[1]

178 All these changes were hastened and reinforced by two
179 new, revolutionary means. First, the physical mobility suddenly brought to an area with no railway by the motor-
166 car, van and light lorry-bus; then, towards the end of the inter-war years, the penetration of the Gaelic-speaking home by the ceaseless voices of broadcasting.

THE PEOPLE

99 emphasis is laid on evangelical preaching. The Free Church claims 'the free exercise of all its spiritual functions, while it fully admits the State authority in purely temporal concerns'.

THE GAELIC LANGUAGE

100 Closely tied in with the background of the island folk is the Gaelic language. For many years this has been dying, yet it is still vigorous enough to make a significant contribution to the mental make-up of the people. It is a living language in that it is used for personal communication, though English is often used internally reserved to when the talk turns to technical subjects. As the Gaelic language stands today, by itself it is agreed by most Gaelic speakers to be barrier to economic progress. The Gaelic-speaking child who also knows English, however, is found to be at no significant disadvantage over the monoglot; indeed, tom have shown, particularly in other multilingual countries, that the bilingual child tends to assimilate knowledge at a greater rate and to a greater depth. Two decades ago a pamphlet issued by the Scottish Council for Research in Education showed that while there were no 'statistically significant' differences between the four areas into which they divided Scotland, the Highlands and Islands came out best in a study of the average level of intelligence:

	Mean	Standard Deviation
The four Scottish cities	100·66	15·29
The industrial belt	99·15	16·18
The rural areas	100·92	14·52
The Highlands and Islands	101·79	13·15

The pamphlet comments: 'It is interesting that the mean of the most remote and isolated districts is the highest, and the standard of deviation the lowest.'

101 The Hebrides are now the only area in Scotland where the language, once Scotland's national language, is spoken by a Gaelic-characterised community. On average 95 per cent of the inhabitants of all the island districts are Gaelic-speaking; even in the town of Stornoway, never regarded as wholly Gaelic-speak-

COMMUNITY FROM PAST TO PRESENT *PT. II*

102 Roman Catholicism was far less complete than that ultimately brought about by Protestantism—Episcopalian or Calvinist.

103 At least twenty-five churches, chapels and tiny oratories are named by Martin in Lewis and the Isles alone in his inventory (1934, p. 106). Harris and its islets also had their complement of 'temples', in addition to the priory church of Rodel. We may perhaps assume that before the Reformation Lewis had a population of some 400 persons, or less than 5 families, and contained some thirty chapels or oratories in inhabited areas. If so, then one church or 'temple', on an average served thirty to thirty-five families, or six or seven families per 'temple'. Yet only four or five religious at Eye, Stornoway, Ness or Uig and Rodel would normally be served by clergy; the people of smaller congregations would be without, for weeks and months or even years.

104 When the people were too distant from priests (and later ministers) to hear the Lessons, they handed down the Word orally. Their power of retaining memorable thought, even in prose, is still remarkable, and verse strengthened memory. For example, 'the Ten Commandments' paraphrased in rhyme are recorded in Fr. Allan Macdonald's little collection, "as given by the God of graces to Moses in the wilderness" (*We Fanntan*, p. 6a). Moses, had he understood Gaelic, would have protested at the omission of the Second Commandment, but no sculptor of Iona, Rodel or Eye would have felt a need for it, being unafraid that a Christian could bow down to a golden calf. Believing, with Solomon, that a craftsman's work is his prayer, the artist-monks held that an 'image' should represent, though never replace, God's creation, and may even quicken our concept of the Creator

COMMUNITY FROM PAST TO PRESENT *PT. II*

105 language." Many Islanders would agree with the statement that Gaelic was a barrier to economic progress. It was not only Lowland schoolmasters, ignorant of Gaelic but an educated, sensible class of men in their day, who used the strap on the palms of the little children "for their good." because they could not understand English.

106 An active Lewis country schoolmaster, who had considerable rural knowledge and experience, said to me: "I know what I have suffered through life from being brought up on Gaelic. If I had my way, I would *punish* (with the strap) every child I heard speaking Gaelic in the playground!" Had the Island School Boards wished Gaelic to be consistently taught with English, they could have prevented

107 One may not only disagree strongly with the means—the strap—but hold that enlightened bilingual teaching is both worth while culturally and also of assistance to intelligence without interfering with use in English of the three Rs, and of secondary and higher education. Yet in Lewis recent non-verbal tests in English and Gaelic show a mean intelligence quotient depressed by about 15 points.[1] The conclusion seems to be that under the present system the Gaelic school child is still at a disadvantage compared to other school children. But even more important to the child's development would seem to be the expression of his response to his rural environment in his own tongue. For this the school texts and the educational code do not fully provide; nor do the tests of life when the adolescent Islander suddenly finds himself at work in a Glasgow factory or abroad in city streets. What concerns us here is the economic drawback of a lack of ready English among

154 sympathetic with each others' idiosyncrasies. A constant joking keeps people at arm's length and discourages the development of empathy.[1]

155 Accompanying this style of indirect, inhibited expressiveness and the low level of stimulation are culturally prescribed opportunities for relatively uninhibited expressiveness. Such opportunities include the ceilidh ("visit"), the drinking situation (mainly the men), the wake, and the "characters" (see below) and such as New Year's. Although young villagers and emigrants often describe the village as "dull" and "dead," the emigrants are happy enough to return to the island for short periods of time, during which they participate in these situations to which expressiveness and limited license are accepted.

156 1. Ceilidh, Clown, and New Year's Festivities: Only on certain occasions is relatively spontaneous and uninhibited expressiveness common or encouraged within the township, and even then the form which this expressiveness takes is fairly narrowly circumscribed. The traditional ceilidh was such an occasion. In the past, people gathered regularly at night in the high ceilidh (the ceilidh house, or home of someone in which a genial atmosphere existed); the high ceilidh was often the home of someone who lived alone), where stories were endlessly repeated and elaborated,

157 genealogies told, and old songs were sung or new ones composed. The concentration of expressiveness in these ceilidhs is in a well-developed, oral repertoire of literature and music.

158 The ceilidh still exists today in the form of less regular gatherings. Stories and genealogies are seldom recited, but songs are still sung. A few new songs are being composed. The word ceilidh is used as both a noun and a verb to mean "a visit" or "to visit," but implies a casual, relaxed atmosphere rather than a formal visit. A formal visit is made by relatives living in Stornoway, government officials or businessmen, and is characterized by more constrained behavior.

159 The ceilidh of today is often accompanied by the drinking of beer or whisky, but a distinction may be made between a gathering which includes both males and females, and a drinking session at which only men are present. In the past, men often gathered in barns or weaving sheds to share beer made locally from barley or brought from town in a large keg. The drinking of whisky was reserved for special occasions, such as births, weddings, funerals, and the festivities surrounding the New Year, but increased income has resulted in the consumption of whisky on many other occasions. Heavy drinking is still an activity engaged in largely by males, and occurs in extra-village locations such as hotels and bothans (see Chapter 6).

160 village locations such as hotels and bothans (see Chapter 6). Drinking situations provide an important opportunity for relatively uninhibited expression by males, and will be discussed further in Chapter 6.

161 The role of clown or "character" is well developed in Hebridean township. In an environment which encourages quietly watchful and somewhat anxious, confrontist behavior, the character is rude, raucous and outrageous, a bite of fire in cold waters. He represents a reversal of normal behavior. The villagers shake their heads, agree that he is impossible, but encourage him to continue, urge him on when he flags, and bring up his escapades for discussion during moments of boredom. There are usually several such characters in a village.

162 Reversal of low-profile and other "normal" behavior is also allowed on particular occasions such as New Year's, at this time among all villagers at work with horses and carts, boys went around the village on New Year's night stealing carts and hiding them on the moor or down by the shore; today they steal gates. Between Christmas and New Year's, groups of boys visit houses in their neighborhood, collecting tea, sugar, biscuits, or money to be used for a party in one of the houses. Such boys are called balaich na hannann, or boys of the hannan. In some Gaelic-speaking areas, hannan refers to a gift this is

163 differentiation and differentiation in personal experience, but to use it in the community, as social coins. The few men who refuse to get involved in drinking episodes that would deplete their available funds are called "mean" and "tight-fisted."

164 For I had a wish, I'd choose to live the same life all over again, maybe a wee bit rougher. We don't get a chance here. The poverty keeps us down. But what does it matter to be a schoolteacher or a minister? What good does it do you? If I have a shilling in my pocket, I've got to spend it. I remember the last time I had a pound note. I put 160 in tweed payments to buy a new stove. I met some of my mais, so I put L20 down on a L50 stove and spent the rest. What a time we had."

165 "I went for a holiday on the mainland and came back with money in my pocket because it's no use drinking in a place where you don't know people. You work a farm."

Drinking occurs at night behind the gray, concrete shield of the bothan or in hotels. Drinking situations provide opportunities, rare in the expressive arena of the village, to express emotions and ideas. These expressions can always be retracted in the cold, sober light of day.

166 "I used to be an alcoholic. Now I spend most of my weekends feeling so terribly ill I wonder (again) if he won't get the D.T.s When something good happens, I wish like hell I could get

[Page 159 is blank; text continues on p.160 —Amsiyet]

167 out and celebrate. There's no other way to express

168 myself."

"Now that Ruaridh has stopped drinking, he's not very interesting to talk to. He's very dull these days. He doesn't say a thing."

During the Christmas season, a sense of excitement and holiday permeates the village. Among the converted members of the Free Church, this feeling is expressed in vigorous participation in long church services and meetings in the homes of the converted. In the rest of the village, the uncommitted are busy with the work at hand for the hotel, or the bothan opens earlier in the week than usual. All special occasions such as funk days or the arrival of relatives generate excitement, which is most often expressed, when the uncontrolled mes, by drinking.

169 A man may propose toasts to the lasses and "Yorges" this rash action with impunity. When a man has been drinking, he is more likely than on other occasions to be openly affectionate to a woman, or to express strong feelings of friendship to his fellows. "It's the only time when you're really happy. You can sing, tell your life story. It's the only time when people are really friendly. But it's a false friendship, because when you want someone the next day, he's not the same person. He's distant, cold. You feel depressed. You want to recreate the situation, so you start drinking again."

155

183 The generally low level of stimulation derives in
181 part from values which restrict opportunities for self-
[521] expression. People are ready to gossip, i.e., to participate vicariously in the escapades of others, but are less
[426] eager to act. Stories concerning mad-cap adventures of some villagers do not belie the existence of constraints
[166] imposed on expressiveness. One of the major reasons given by young villagers for wanting to leave the island, and by emigrants for why they left, is that, "There is nothing to do. The place is dead."

156 In the everyday life of the village, a style of
181 indirectness and restricted communication is encouraged.
183 A man might be praised in an obituary by the phrase, "His
621 voice was never heard in the community." The encouragement of a "low profile" of behavior is characteristic of communities in which people meet each other frequently and know they will continue to meet and ask things of each other for a long time to come. Indirectness avoids conflict arising from divergent expectations, and embarrassment from changes in plans.

155 A major feature of practices of child-rearing on
861 the island is inconsistency, which develops a style of guarded watchfulness and hesitance to act or express oneself. Children are teased by being offered things which are then snatched away. Punishment is inconsistent.

155 Lies are frequently told. "Every other sentence my
877 father says is a lie. If you believe half of what he
[573] says, you're a fool. If you believe a quarter of what he says, you're getting near the truth. If you believe an eighth of what he says, it's probably the wrong eighth."

156 Villagers engage with each other in constant, quiet
621 game-playing. They are dependent on each other for many things, but try to minimize the control that others have over them while improving their own positions. If someone brings plants or shrubs as a gift, the response is likely to be, "She was probably pruning her garden and needed to get rid of the leftover garbage." South Uist hospitality releases the person from feeling obligated. (See Emmett 1964: 16-17, for a description of a similar situation in Wales.) A man who is asked about his new tractor replies, "Its faults will come out later." If he were to say it was all right and then it broke down, he would have lost points. In discussing the mental health of a villager recently returned from Craig Dunain (a mental hospital near Inverness), someone observed, "He's better than the doctor who let him out." If another breakdown were to occur soon, someone would be sure to comment, "And so-and-so said he looked all right."

156 Such training allows little room for the development
572 of close friendships in which the individuals involved are

ST KILDA

and to show their friends at home, that they had braved the 484
hazardous Atlantic seas to visit St Kilda on the very edge of the 26
world. The tourists were charitable, but this brought a psycho- 175
logical evil in its wake. In 1886, Robert Connel wrote: 'One [155]
cannot be long on the island without discovering the great moral injury that tourists and sentimentalists and yachtsmen, with pocketfuls of money, are working upon a kindly and simple people.' It was estimated that the islanders collectively derived a profit of 5s from each of the 200 or more tourists who arrived during the short summer.

The new influx of cash into a community which required 436
money as an exchange commodity because the original native 198
produce was becoming less saleable, hastened the decline of effort to be self-supporting. The numbers of seabirds slaughtered [239]
steadily fell; paraffin oil replaced the traditional bird oil in St [369]
Kildan lamps. The need for daily work, to toil in fellowship with [461]
others, was dissipated; the islanders could purchase most of the food they required, provided communications with the mainland were maintained. The population was in any case dwindling, as [161]
St Kildans became more aware of 'the other life' available on the mainland of Britain.

Finally, on a misty summer's day in August 1930, at a cost to 166
the nation of little under £1,000, St Kilda was left to the care and keeping of the changeless Atlantic. It is now preserved by the National Trust for Scotland as a crumbling monument to a small human tragedy of a kind that has been repeated, and will be repeated, in other small communities who cannot argue out the case for their survival in terms of economic viability. The island [712]
is now occupied by military personnel in connection with the Hebridean rocket range on South Uist.

St Kildans were described by Dean Monro, in 1549, as 'simple, 175
poor folk, scarce learned in any religion'. In 1698, Martin Martin 181
published *A Late Voyage to St Kilda*. He went there in the company of a minister who had been summoned to the island to denounce a certain false prophet who had risen among the 180 inhabitants (pretending he was an emissary of St John the Baptist). Martin found, as did later visitors, that the island economy [825]
and the quality of its life were closely dependent upon its birds,

184 verses would ring false to them! Before 1939, two-fifths
24 of the rural pupils of most non-crofting counties came or
341 went in the school year—most of them the children of
166 farm servants. Their schooling suffered, and their teachers might be reduced to despair; indeed it is to educationists, rather than to agriculturists, that we owe a survey of these facts. When they leave home to be 'hired', the young folk learn to fend for themselves but may suffer in the learning: stability of character and endurance in attachment are hard to form.
182
871
155

It would be difficult to overstress the tragedy of the long-continued break-up of rural communities in the Lowlands. From the later years of the English invasions, as 175
when Major wrote with his knowledge of Scotland in 1500, 176
the tide of emigration through the early, largely untre- 241
corded phases of the agricultural revolution, down to the 361
later phases from 1750 or 1800 to the present day. No 164
one who has worked with fellow-servants on Scots farms will underestimate their sterling qualities. But the break- 155
up, the tragedy, happened. It was boldly sketched by the Rt. Hon. Thomas Johnston (to 1929) and verified by [114]
Miss I. F. Grant (1924 onward). Beginning from intimate study of well recorded and surviving ways in the Highlands and the Hebrides, Miss Grant realised the significance of earlier Lowland life in the farm-hamlet or ferm-toun, as Lowlanders themselves could hardly have done. Comprehension of this break-up of community brings out the value of the enduring elements of communal life still recorded, remembered and surviving in the 'Outermost' Hebrides, at the core of 'the North and West'.

[1] Ideas outlined in this section are developed in A. Geddes (1938-54). Detailed references will be found in the Bibliography.

171 though the suspected person was not thereby accused of
751 ill will, he would have to make some effort to put it right.
'Cure' might be sought either by counter-malediction on the supposed ill-wisher, known or unknown, or else by prayer that the evil should be spread so widely as to be harmless, as "on all the wild birds of Heaven . . . that it would do them no harm"—a charming touch! (*Carmina*, vol. iii). Prayer was the normal and the best protection, free of any malediction, and was included in general intercession for loved ones. But fears remain—not only in 'distant' isles—both in peace and in the extreme stress of war.
782

114 A psychotherapist of 1917-18, A. J. Brock, wrote that
156 the "War was not to create a new thing, the ordinary life of every day being itself a sort of battle".[1] Brock brought the hard-learned psychotherapy of war to bear upon a fresh understanding of the countryman struggling against an environment with which he has got out of tune. Failing in spite of strained effort to get the food and warmth he needs for himself and his 'wife and weans', the peasant may lose happiness in home and village, and faith in the future. "How did princes people earn, or that ?" wrote Brock, noting that the risks and casualties of bad times in the past brought fears and floating pictures comparable to those of 'shell-shocked' patients.

171 In all lands the unity of family life and labour is
710 symbolised in homelier folk-lore by the protective spirit of each homestead. As long as the work is carried on heartily and thriftily the Brownie is pleased. But the people may become negligent, or begin to labour from mercenary motives. The true spirit of the work is then upset and (in all folk-lore) the Brownies begin to give
[113]

[1] A. J. Brock, *Health and Conduct*, 1943, pp. 133-139.

171 trouble. "Everything seems to go wrong"; and the
710 peasant falls asleep at night in fear of ills to come. First in his dreams and next in his day-dreams, these take shape as an offended, hostile 'spirit'. The spirit of the place
171 —of the place-work—has become angry. So also, if the
710 peasant's wife pursues her household work 'in the right
787 spirit', then in her dreams and reveries she is helped by kindly presences; but if not, things go wrong, objects mislaid have been taken by 'someone' and a tormenting house-imp plays havoc with her home. These figures of day-dreams were involuntary and 'shady', without the clarity either of earthly things or of heavenly visions. Yet they personified moods of real significance.

176 The Cruisg of the Gaelic poet helped about the farm and household—like the Tonte of Sweden and the Lubberfiend of Merrie England in Milton's *L'Allegro*. Each task may have its own symbol. Of one of these, the cattle-tending *Glaistic* of the Highlands and Isles, Brock quotes from Mrs. E. Carmichael Watson: "Harmless and lovable as a rule,—especially in the older stories—in a few of the later stories she is represented as irritable. . . . The more recent stories about the Glaistic are rather unpleasant. She no longer plays with the children or sings rhymes—she has degenerated into a kind of female ruffian. Probably it would be nearer the truth to say that the change has been in the Highlands rather than in the Glaistic." Brock comments, "This last remark is significant. The increasing irritability of tutelary nature-deities means that the spirit of the old economic life—the equilibrium between Highlanders and Highlands—is being upset"; and so too is that between Highlander and Highlander! In Lewis *Ni Chlach Urlar* (She (or It) of the Hearth Stone), who personified domestic strife, makes trouble; and neighbours come to suffer too!
176
178
[155]
204

847 A girl also makes an early pretense at assuming her role.
While a boy is never seen helping within the house, and, therefore, his duties begin later, a small girl soon begins to help make beds and do the cleaning. If she is an only child, or has been left behind by her brothers who have left the Island, she is expected to take their place on the croft. In any event, she will be taught how to milk, how to plant a garden, and how to help in all other tasks of crofting, except cutting
[562] corn and shearing. She learns at a very early age and in diverse ways that the primary role of a woman is to serve the needs of man, some man, throughout her life, unless she is strong enough to live alone.

Learning the virtues valued by their parents and the community, as well as the tasks essential to crofting, both boys and girls are inoculated with the ethos of the Islander long before they can understand the importance of their object lessons. They are separated by more than the division of labor of their parents. As we shall see, the almost unaltered status values of the culture relegate males and females to two different, but complimentary, spheres of activity.

871 As they progress in school, conflicts begin to develop.
155 In one way this is inevitable. Until 1953 there was no attempt to teach the children anything that would directly relate to the life expected of them on Skye. In particular there were no agricultural subjects. Even now, there is but one travelling teacher of agriculture to serve the entire

571 Island. Being taught about the larger world beyond, most
185 children begin to show exasperation with the croft and the
155 duties it imposes. At first they become reluctant to do their chores after school hours or on holidays, or unable to exercise the strong authority of their fathers; they do the work grudgingly. This is especially true of those who are planning to go to a university. While many boys take an interest in the stock and like to plough, if there is a tractor, they frequently complain about the slow pace, the boredom of the long winters, the restrictions on their time, and the weather—above all, the weather. Girls are no less outspoken. In particular, the girl who has been left behind by her older brothers and sisters to care for the parents will feel that such a life leaves much to be desired. She learns of another, entirely different life in school, and she hears her siblings tell of this new life when they return for a visit. Naturally, she begins to think digging potatoes is beneath her dignity. The most frequently heard complaint is, "You can't dress out here." The underlying conflict for both boys and girls in their teens seems to be one between a desire for adventure or opportunities for individual choice and the routine, circumspect behavior expected of them.

573 Added to this desire is the realization that they may
824 not really be needed at home. The small crofter with a piece of land hardly larger than a German laborer's garden can handle all the necessary chores by himself or, at periods of peak activity, with the cooperation of his wife and his neighbors. A medium sized croft may provide work for one, two, or even

273 one night of the week in which controls are imposed, by
275 the arrival of Sunday when no one is supposed to drink.
[171] The bothan was occasionally open on Friday night, and on Monday night. ("If there's anything left from Saturday night, we finish it on Monday.") During the summer of
[221] 1971 when the days were long and filled with communal township activities such as peat-cutting, the bothan was open every night of the week. The bothan closed when the man supplying it with drink suddenly died, and has not reopened.

273 2. Functions of Drinking: If a man decides not to
571 participate in drinking, he is not praised for his self-
• 156 control or his ability to abstain; rather, people say, "What's the matter with him that he doesn't mix?" A man goes off to the hotel or to a bothan "for a wee nip" or "for a pint" (the pint of beer which serves as a chaser for glasses of straight whiskey). Both phrases are euphemisms for the huge amount of whiskey and beer which must be consumed if a man is to satisfy the canons of social intercourse which obtain. A man can drink alone or, in the company of others, drink very little only at great social cost.

"You can't go in for a casual pint in a place like the bothan because it's a place where people mix, and you're bound to meet old friends you haven't seen for

273
571
• 156 a while. It would be an insult not to take a drink with
[576] them; you musn't miss your round."

273 The usual practice when drinking with friends is
571 for one person to buy the drinks; everyone drinks
156 together, and then someone else buys the next round. To
431 drink slowly is to indicate that you intend to miss your round. A relative who returns to the island for a holiday usually pays for more rounds than he receives, and may spend as much as L80 in a single week.

If a man wants more drink than his fellows, he has several choices. He may step up the pace of drinking by buying more rounds, which means that he is likely to pay a larger share than the others during the evening as they will be ready to quit before he is; or he may keep a bottle hidden outside the room, and disappear periodically for a private nip, after which he returns to the group.

273 As incomes have grown, excessive drinking, which was
571 once confined to a small number of occasions, has also
156 increased. In the days when money was scarce, people shared
178 with others what they had. Elaborate and relatively lavish
434 ceremonies in which all community members participated were possible because of the contribution in labor and goods of members of the community. The custom prevailing today is to use the added money not to purchase more goods and services, to travel, or in other ways that might result in both social

273 differentiation and differentiation in personal experience,
571 but to use it in the community, as social coin. The few
• 156 men who refuse to get involved in drinking episodes that
178 would deplete their available funds are called "mean"
434 and "tight-fisted."

"If I had a wish, I'd choose to live the same life all over again, maybe a wee bit rougher. We don't get a chance here. The poverty keeps us down. But what does it matter to be a schoolteacher or a minister? What good does it do you? If I have a shilling in my pocket, I've got to spend it. I remember ten years ago, I went into town with L60 in tweed payments to buy a new stove. I met some of my
[435] pals, so I put L20 down on a L50 stove and spent the rest. What a time we had."

[484] "I went for a holiday on the mainland and came back with money in my pocket because it's no use drinking in a place where you don't know people. You want a yarn."

273 Drinking occurs at night behind the gray, concrete
571 shield of the bothan or in hotels. Drinking situations
156 provide opportunities, rare in the repressive arena of the
154 village, to express emotions and ideas. These expressions can always be retracted in the cold, sober light of day.

"I used to be an alcoholic. Now I spend most of my weekends feeding my brother lager so he won't get the DT's. When something good happens, I wish like hell I could get

[Page 159 is blank; text continues on p.160
--Analyst]

273 571 156 154 out and celebrate. There's no other way to express myself."

"Now that Ruaridh has stopped drinking, he's not very interesting to talk to. He's very dull these days. He doesn't say a thing."

273 571 527 794 796 During the Communions, a sense of excitement and holiday permeates the village. Among the converted members of the Free Church, this feeling is expressed in vigorous participation in long church services and meetings in the homes of the converted. In the rest of the village, the unconverted men don their best suits and head for the hotel, or the bothan opens earlier in the week than usual. All special occasions such as fank days or the arrival of relatives generate excitement, which is most often expressed, among the unconverted men, by drinking.

273 571 584 A man may propose to a woman, and the next day "forget" this rash action with impunity. When a man has been drinking, he is more likely than on other occasions to be openly affectionate to a woman, or to express strong feelings of friendship to his fellows. "It's the only time when you're really happy. You can sing, tell your life story. It's the only time when people are really friendly. But it's a false friendship, because when you meet someone the next day, he's not the same person. He's distant, cold. You feel depressed. You want to recreate the situation, so you start drinking again."

683 183 157 discovered on many occasions. I once entertained the thought that its absence was indicative of a decadent culture. Then I discovered that it was a traditional norm of behavior. Only once during the modern period has there been any aggressive behavior, during the closing years of the "Clearances." Some who remember these "old warriors" who were not afraid to stand up for their rights wonder why their descendents have changed. 793 Today only the ministers are aggressive in their dealing with their congregations, and they reserve their aggressive pose for their Sunday sermons. Naturally, the people quarrel among themselves and a couple of drunken men may come to blows with each other or the policeman who interferes. In any group situation or in any dealings with outsiders, however, dislike or resentment takes the form of placid resistance. The Islander 683 183 157 626 remains courteous and suffers in silence. This is "affect suppression," resultant from Protestantizing the crofters.[39] Even the talkative individual, unless he stands among the gentry or has achieved prestige status through his profession, is considered an eccentric. He must stand the snickers of the group and bear the title of a "worthy," a man who does not act his age.

152 626 156 Real anger, manifested by a loud or quavering voice, or table pounding, clenching one's fist or other recognizable signs, is not characteristic of the Sgiathanach in public. The man who forgets himself is always taken in hand by the minister, an old man, or a teacher. He may feel righteous indignation, but if he

[39] I am indebted to Conrad Arensberg for calling my attention to this fact.

becomes too worked up, he is expected to withdraw. On occasions, 152 156 626 273 such as weddings, when all have had their share of the uisge beatha (water of life), there may be heated quarrels, including the raking over of old clan feuds. Again, some older man will take the offender in hand, "It's not you that's talking, Murdo, it's the drink." The man almost invariably expresses regret for his outbreak later. Political meetings, often explosive situations in a democratic country, may involve some heated debate, but the code of diquette is never breached. When one politician told the Kilmuir crofters that something should be done to stop depopulation because soon they might not have any young men for the army, the people were indignant, but they remained quiet. In the case of the cattle thief, cited above, no one lost his temper. In fact, the matter was discussed almost in a monotone.

People still talk about the one outstanding example of aggression which has occurred recently in Portree. At the end of World War II, a collection was made for the benefit of the returning servicemen. A public meeting was held to discuss what would be done with the money and who was eligible to receive a gift. Two young men, both of whom had spent several years in a German prison, and had been drinking, became boisterous. They accused the committee of spending the money and trying to cover it up. The chairman left the meeting. His replacement, a newcomer, restored order by threatening to call a policeman, something which never had been suggested at a public meeting. The boys were forgiven because they had been

German prisoners and must have had a terrible experience, and 15 anyone knows the uisge beatha brings back memories. 62

Gossip

Social control does not always take such dramatic forms as those we have been considering. Infringement of the traditional norms is deterred, and deviation from the expected patterns of behavior are censured, by a more informal technique, namely gossip. It is not an exaggeration to say that everyone within each neighborhood knows his neighbors intimately. They know the individual, his family, and his ancestral stock. They are aware of his activities inside and outside his cottage, the way in which he meets his moral and religious obligations, and his general outlook on the world. The villagers are equally aware of the character and behavior of one another. Further, almost all the crofters who have dealings in the village know and are known by the villagers, at least by reputation. If any individual is not known, personally, it is relatively easy for a person to find out all he wants to know from another villager. To remain a myste is dangerous; it begets resentment. Any new arrival to the island, other than a tourist during the summer, soon becomes known in the local area. If he is an important person, his arrival and departure are heralded across the island.

Gossip has enough emotional force on Skye to deter deviations by the native and to mold the newcomer's behavior to no small degree. It has been known to make people so

l relationships and groups	571		

233 654 As these quotations bring out, the subsidy enables people to risk rearing cattle under conditions that would otherwise make success very uncertain.

496 591 [484] 2. Communalism: Despite the decline in various agricultural activities and the individuation of land use, some activities persist which require mutual aid. Conditions of low geographical mobility, in which mutual watchfulness and competitive gamesmanship have developed (see section on "Social Marginality"), contribute to the strong boundedness of the township network. There is still competition over who begins an agricultural activity at a particular time of the year. No one wants to be so early that he stands out like an over-eager novice running risks of frost or other bad weather, but there is an element of pride in being the first to harvest potatoes or bring in the peat. Almost everyone cuts peat, a time-consuming and back-breaking job made pleasanter with a large labor force; and every aspect of the activity--the time of cutting and bringing in, the length of time required to cut peats, the size of the peats when dry, the type of meal served to the work crew, the evenness of the final peat stack--is subject to intense scrutiny.

[156] [221] 314 591 496

621 591 [426] Despite these tendencies, an individual is still enmeshed in familial and village ties. Villagers walk in and out of each others' houses without knocking; only a "stranger" knocks. Goods such as tape recorders, binoculars and books are passed around the village; people even borrow each others' reading glasses.

858 855 861 621 Children are "borrowed" as well. They are loaned out to relatives and neighbors to run errands, or may even live with them. They are scolded as often by a neighbor or other villager as by a parent. A child might be told, "When someone (any adult) tells you to do something, you do it, no matter who that person is." The parents of one household are criticized for taking their children's side against other children and other parents. "He's teaching his children not to mix with others. One child is as good as another. They may be good one day, but they're likely to be bad the next." A child or adult who enjoys spending time by himself is still considered extremely odd. An important criterion by which someone's mental health or general personality is evaluated is whether or not he "mixes" well. It is fairly common for childless households to "adopt" a child of neighbors or relatives; that is, the child spends a great deal of time with them. They may go to the child's house to put him to bed at night, or the

[156] 597 621

177 156 "I was in the Navy during the last war. We were in Norway, and got an invitation to visit the palace. I didn't go. I was afraid I'd make a mess of things."

"This place has an inferiority complex. It's mainland-oriented; so you feel outlandish."

575 197 186 [181] The new director of an association which promotes the speaking of Gaelic is a Lowland Scot who learned Gaelic when he was in England. He was working in England and, as a Scotsman, felt so much like a foreigner that he decided "to be a real foreigner"--so he studied Gaelic. Motives which prompted legislation protecting crofting also lie behind the development of organizations which attempt to protect and preserve the Gaelic language.

[175] An Comunn Gaidhealach, the Highland Association which promotes the speaking of Gaelic, was founded in 1891 in a town on the mainland, and has always been urban-based. Eighty years passed before the association established its headquarters in Stornoway; but the headquarters were relegated to hindquarters when the director found that he needed to be on the mainland to exert pressure on influential organizations for aid and support. The organization is condemned by ministers on the island, who see it as an organization that sponsors light-hearted singing. The magazines and books which it publishes or sponsors are seldom read by the rural islanders. The

[143] [218]

183 181 [521] The generally low level of stimulation derives in part from values which restrict opportunities for self-expression. People are ready to gossip, i.e., to participate vicariously in the escapades of others, but are less eager to act. Stories concerning mad-cap adventures of some villagers do not belie the existence of constraints imposed on expressiveness. One of the major reasons given by young villagers for wanting to leave the island, and by emigrants for why they left, is that, "There is nothing to do. The place is dead."

[626] [168]

156 181 183 621 In the everyday life of the village, a style of indirectness and restricted communication is encouraged. A man might be praised in an obituary by the phrase, "His voice was never heard in the community." The encouragement of a "low profile" of behavior is characteristic of communities in which people meet each other frequently and know they will continue to meet and ask things of each other for a long time to come. Indirectness avoids conflict arising from divergent expectations, and embarrassment from changes in plans.

155 861 A major feature of practices of child-rearing on the island is inconsistency, which develops a style of guarded watchfulness and hesitance to act or express oneself. Children are teased by being offered things which are then snatched away. Punishment is inconsistent.

155 861 577 [593] Lies are frequently told. "Every other sentence my father says is a lie. If you believe half of what he says, you're a fool. If you believe a quarter of what he says, you're getting near the truth. If you believe an eighth of what he says, it's probably the wrong eighth."

156 621 Villagers engage with each other in constant, quiet game-playing. They are dependent on each other for many things, but try to minimize the control that others have over them while improving their own positions. If someone brings plants or shrubs as a gift, the response is likely to be, "She was probably pruning her garden and needed to get rid of the leftover garbage." Such negativism release the person from feeling obligated. (See Emmett 1964: 16-17, for a description of a similar situation in Wales.) A man who is asked about his new tractor replies, "Its faults will come out later." If he were to say it was all right and then it broke down, he would have lost point. In discussing the mental health of a villager recently returned from Craig Dunain (a mental hospital near Inverne someone observed, "He's better than the doctor who let him out." If another breakdown were to occur soon, someone would be sure to comment, "And so-and-so said he looked all right."

156 592 Such training allows little room for the development of close friendships in which the individuals involved are

156 sympathetic with each others' idiosyncrasies. A constant
572 joking keeps people at arm's length and discourages the
[522] development of empathy.

156 Accompanying this style of indirect, inhibited
154 expressiveness and the low level of stimulation are culturally prescribed opportunities for relatively uninhibited expressiveness. Such opportunities include the ceilidh ("visit"), the drinking situation (mainly for men), the role of clown or "character," and holidays such as New Year's. Although young villagers and
[166] emigrants often describe the village as "dull" and "dead,"
[484] the emigrants are happy enough to return to the island
[181] for short periods of time, during which they participate in those situations in which expressiveness and limited license are accepted.

156 3. Ceilidh, Clown, and New Year's Festivities: Only
154 on certain occasions is relatively spontaneous and unin-
574 hibited expressiveness condoned or encouraged within the township, and even then the form which this expressiveness takes is fairly narrowly circumscribed. The traditional
[178] ceilidh was such an occasion. In the past, people gathered
519 regularly at night in the tigh ceilidh (the ceilidh house,
[538] or home of someone in which a genial atmosphere existed;
[533] the tigh ceilidh was often the home of someone who lived alone), where stories were endlessly repeated and elaborated,

156 genealogies told, and old songs were sung or new ones
154 composed. The concentration of expressiveness in these
574 forms resulted in a well-developed, oral repertoire of
178 literature and music.
519
[538]
[535]

The ceilidh still exists today in the form of less
[538] regular gatherings. Stories and genealogies are seldom recited, but songs are still sung. A few new songs are
[533] being composed. The word ceilidh is used as both a noun and a verb to mean "a visit" or "to visit," but implies a casual, relaxed atmosphere rather than a formal visit. A formal visit is made by relatives living in Stornoway, government officials or businessmen, and is characterized by more constrained behavior.

156 The ceilidh of today is often accompanied by the
154 drinking of beer or whiskey, but a distinction may be
574 made between a gathering which includes both males and
243 females, and a drinking situation at which only males are
198 present. In the past, men often gathered in barns or weaving sheds to share beer made locally from barley or
273 brought from town in a large keg. The drinking of whiskey
[178] was reserved for special occasions, such as births, weddings,
[434] funerals, and the festivities surrounding the New Year, but increased income has resulted in the consumption of whiskey on many other occasions. Heavy drinking is still an
[275] activity engaged in largely by males, and occurs in extra-village locations such as hotels and bothans (see Chapter 6).

273 village locations such as hotels and bothans (see Chapter
[154] 6). Drinking situations provide an important opportunity for relatively uninhibited expression by males, and will be discussed further in Chapter 6.

522 The role of clown or "character" is well developed
156 in Hebridean townships. In an environment which encourages
154 quietly watchful and somewhat anxious, conformist behavior, the character is rude, raucous and outrageous, a bite of fire in cold waters. He represents a reversal of normal behavior. The villagers shake their heads, agree that he is impossible, but encourage him to continue, urge him on when he flags, and bring up his escapades for discussion during moments of boredom. There are usually several such characters in a village.

156 Reversal of low-profile and other "normal" behavior
154 is also allowed on particular occasions such as New Year's,
527 this time among all villagers. In the days of horses and
[522] carts, boys went around the village on New Year's night
[883] stealing carts and hiding them on the moor or down by the shore; today they steal gates. Between Christmas and
[574] New Year's, groups of boys visit houses in their neighbor-
[431] hood, collecting tea, sugar, biscuits, or money to be used for a party in one of the houses. Such boys are called
796 balaich na bannagan, or boys of the bannag. In some
431 Gaelic-speaking areas, bannag refers to a gift that is
184

166 The image of the island
484 as spiritual home is fostered by The Stornoway Gazette,
823 and by nostalgic songs, most of which were written by
204 islanders who emigrated to Canada in the first quarter
[533] of the century.

632 The crofting township as a strongly bounded network
241 continues to exist, although crofting as a socioeconomic pattern which evolved in a situation of limited social and geographical mobility, low cash reserves, and the restriction of a large population to a region of limited resources, is very different from crofting as defined by an office in Inverness. As far as the crofter is concerned, to be defined as a crofter by the Crofters Commission and other government agencies is to have access to resources which affect the environment in which he makes his choices.

241 The individual is faced with the semi-security of
288 crofting and weaving, in contrast with the exciting but risk-laden opportunities offered by the dominant urban-
[654] industrial mainland. Crofting and Harris Tweed have been protected by government legislation. Various subsidies
[745] and loans are available. In times of unemployment, social security is available. Extremely important as contributers
621 to boundedness are the non-economic incentives: the
156 individual has a place in a human community; he is given

621 character traits just by virtue of his belonging to a
156 particular family; he is protected from the "out" world even though he may have broken its rules. The
[527] village provides a colorful arena of recreation in the
[574] form of ceilidh, the character, and holidays such as New Year's.

781 A major system of order and meaning is provided by
794 religion, and by the opportunity to belong to a tightly-
[181] knit religious clique. Lewis is sometimes called Tir an t-soisgeul, Land of the Scriptures, in contrast with
571 the decadent outer world. The male drinking fraternity
273 constitutes a second important group. And for everyone
[527] there is the cinema of their neighbors' activities, which are placed in a vast human calendar that includes the behavior of many generations.

67

The age structure of the Lewis population in 1951 and 1961. The trend shown over the forty years 1861-1901 has strengthened and consolidated, so that the 1961 population is middle-aged

the 1914 war, but some 200 of those who survived the holocaust were lost in the wreck of the *Iolaire* on New Year's morning, 1919 —the first morning of the first new year of peace, literally within sight of home. Again, the effect of emigration was a loss, in many small communities, of a full generation. Where religion is strong and thrice-distilled, there tends also to prevail a state of mind which dwells on guilt and, where people are accustomed to ex-

771 783 153 [058] press themselves in terms of religious values and ideas, the fear of having committed unforgivable sin. The normal adjustments, reflections and mental stocktaking of middle life are possibly more readily precipitated towards depression in an emotional people 733 157 prone to serious thought. This brings of course a concomitant spectrum of problems in an area where in general a man is expected to take a dram and stand it; both nature and nurture are relevant factors. In the words of Cunningham Graham (1899), the medical adviser finds himself 'preaching teetotalism, that is for others, but himself taking his glass of whisky for the reasons which have been so cogently set forth by St Paul the Apostle to the Caledonians.' For those who comment in isolation on a community's [539] indulgence in alcohol, one must quote a Gaelic proverb: *'Tha smuideag fhein an ceann gach foid'*—Every peat-end has its own smoke.

733 *175 [539] From the earliest times the Western Isles have indeed been regarded as supporting a population with an uncanny predilection for spiritous liquors. To a certain extent the spirits were needed by ill-nourished crofters to keep out the damp and cold when on the moors or at sea; and people in a depressed economic or mental condition will anywhere seek refuge in alcohol or other available drugs—forgetting the old Gaelic proverb 'Better the little fire that will warm than the great fire that will burn.' The evil effects of drinking have certainly at times been serious: in 1869 Sir James Matheson addressed a circular letter of remonstrance to his tenants, indicating that those guilty of misconduct were liable to be deprived of their holdings. In 1920 a vote was taken in Stornoway under the Scottish Temperance Act, with the result that the town went 'dry'; three years later the poll was upheld. Then in 1926, with a majority of 84, Stornoway went 'wet' again.

275 [733] But the 'drink question' has been given undue prominence and dragged out of its island context. For instance, Stornoway contains all but three of the licensed premises on the island (at Tarbert, Rodel and Carloway) and, as the chief centre for business and pleasure, must naturally attract anyone seeking refreshment.

COMMUNITY FROM PAST TO PRESENT PT. II

185 the mansion, lodges, and grounds or 'policies', much was
747 built and laid out for himself at the time, though part was
for reclamation. This contrasts with his provision for
423 those whose homeland he had bought—the sum spent
upon his own mansions and grounds being nearly half that
spent directly for the good of some 20,000 fellow-Gaels.

185 Matheson was not technically equipped for his chosen
157 task of 'reconstruction'. Nor was he fitted by trade in
the East for the leadership of a people accustomed, in
(623) spite of dire poverty, to considerable freedom. Ignorant,
one gathers, of the language of the people, his choice of a
later Factor was hardly a happy one. Tradition in Lewis
185 speaks of this Donald Munro as an 'autocrat', and evidence
623 in 1874 confirms it. In addition to being the Factor for
423 an ageing man and so holding economic sway over the
people, he held seventeen public and semi-public offices
661 in the Island, from Justice of the Peace to Captain of the
Volunteers, still other offices being held by his clerk! The
extent of his sway is also shown by his having served
summonses of removal upon fifty-six families on his own
authority. As a result of the treatment of the officer sent
to serve the summonses, three crofters were tried on a
charge of "assault committed on an officer of the law in
revenge for having executed his duty". When asked in
court if Sir James would not have disapproved of this step
and the manner of its execution, Munro replied that it was
his practice "never to trouble Sir James with small
matters". "Then you consider the eviction of fifty-six
families a small matter?" was the retort. These 'Bernera
rioters' were found not guilty, they and their neighbours
were left in possession, and soon after the Factor demitted
185 office.[1] Lewismen felt the result to be a moral victory,
829

[1] Brand Report, 1902, p. lxxi.

CH. X BETWEEN TWO WARS, AND AFTER

423 In May 1918 Lewis was bought by Lever of Port
565 Sunlight, then Baron Leverhulme of Bolton-le-Moors (his
birthplace), the head of a great combine with 50,000 white
• 157 and 25,000 black employees. Meeting him in Lews Castle
124 in August 1919, Dr. Hardy and I found him troubled
by a human situation he had failed to diagnose. Short
and stocky but very erect, quick-eyed and rapid of manner,
and with a wide expressive mouth, he spoke earnestly of
his plans; but his eyes flashed and his mouth set, as he
rapped out, "They keep putting off, yet they leave the
people in houses *not fit for Kaffirs!*" The question,
"What objective inspired—or misled—Leverhulme to
buy the Island?" is answered by his son and biographer.[1]

159 By 1917 Leverhulme had felt it was time to devolve
423 his personal authority over his business, in the interests
of its future. Hence he looked about him for an estate
433 in which he could exercise "his passion for changing the
face of nature", and his eagerness for 'planning' with
drawing board and T-square, and for philanthropy.[2] He
nearly bought an estate in the Midlands in order to develop
it; but work had already begun there, and he wished to
find a place which would be his to remodel from the start.
Thirty years before, Leverhulme had visited Lewis and
now in 1917 he spent a week there, motoring all over the
Island. "He was enraptured . . . he saw not merely a
countryside in need of more and better roads, not only a
residence and grounds capable of alteration and improve-
ment, but a problem to be solved, a human and racial
problem which had so far baffled all who had tried to
solve it. . . . He had been told the Lewis man was lazy,

(113) [1] Leverhulme (2nd Viscount), *Leverhulme: By His Son*, 1927, chap. xxvi, p. 221 ff. Lord Leverhulme, who had thought of styling himself 'Of the Isles' took the title 'Of the Lews'.

[2] Leverhulme (1927), cf. pp. 81-86.

COMMUNITY FROM PAST TO PRESENT PT. II

185 In 1919, when the men came home to Lewis they could
727 still see reasons for hope. They found a strange proprietor,
known first for his outstanding—some said ruthless—
• (157) business ability, and only secondly for his philanthropy.
They heard his plans and were inclined to listen.

185 Yet, remembering their pre-war losses and the notorious
fluctuations of prices and employment in the fisheries, they
wished for a policy of insurance, as it were; so, if their
home lay near a promised farm, of which they had long
159 meant to claim a share, they claimed this forthwith. Only
too soon after, in the early years of Leverhulme's adventure,
458 the fall in total sales and prices of fish brought immediate
433 loss to the keenest and hardest working of the fishermen,
228 and to their financial backers in Stornoway. These losses
warned others of the uncertainties of fishing. Now the
fall in the fishing industry is not so much as mentioned in
the biography of Leverhulme; nor do we remember a
(654) word of it in Leverhulme's speeches. One finds no data
to show a substantial endeavour by the Scottish Office to
co-operate with Leverhulme in framing policies either to
change the trend of European markets or to make local
adaptations to combat downward trends. The Fishery
Reports certainly record the losses, year by year. As for
the Island fishermen, they shared the feeling expressed
by other Scots fishermen, that the old markets across the
North Sea, eastward to what had been St. Petersburg,
could and should be reopened, not closed 'for party
reasons' by 'English politicians'. Although ostensibly
Leverhulme ignored it, he cannot really have been unaware
of the effect of the downward trend of the fisheries upon
his own prospects of success, and upon the hopes and
confidence of the fishermen. Having been so outspoken
upon the shortcomings of Government with regard to local

198

In Claigan, for example, the crofters felt they would do 234
better with private flocks than with a club stock. Although 476
each man now has his own sheep on the township grazing, they 178
are cared for like any club stock. The four crofters are
needed for success at the dippings, marking, and shearing,
and they are always at the fank on these occasions. In larger 234
townships, those with ten or more holdings, the need for all 476
the crofters to help out at the fank is less pressing while 621
the felt need for auxiliary employment is stronger. In con- 632
sequence, the cooperative work habits run less smoothly. In
an attempt at adjustment, many townships have resorted to
paying the share holders for their labor from the profits.
To the best of my knowledge, only one township has witnessed
the total suppression of the cooperative spirit; all the
crofters are too busy with full-time employment to bother with
the steadily declining sheep stock.

Nevertheless, it has become commonplace for the crofters (829)
to complain of at least one individual in the township who
does not pull his full share, someone who is "trying to
sabotage the whole thing."

Independence is a personality trait, but it is best 157 •
described as a steadfast determination not to conform for the 476
mere sake of conformity when an innovation handed down from 829
the outside commercial world is at stake. The old ways are the 888
best ways, even if only the old men think so. It is the old
men who uphold the traditional practices. As long as they do,
and as long as unanimous consent is required for any change,

199

• 157 the Highlander will be "independent." As for being "just not
476 cooperative," what the critic really means is that the crofter
829 is unable to cooperate in the ways city people or more sophisti-
(888) cated farmers do. The cooperative movement has come to Skye,
but it was not a local venture. The Scottish Cooperative and
Wholesale Society opened its shops, without shareholders. The
distinction between the crofters' simple cooperation and so-
phisticated cooperation, including capital investment, does
not invariably hold.[11] There are sheep stock clubs. Govern-
ment loans, of course, provided the initial capital.

476 In dealing with the topic of cooperation, as any part
621 of the economic aspect of the culture of the Sgiathanach,
632 the basic importance of the township again and again emerges.
Only a few crofts exist apart from a township. A more detailed
analysis of the township system and the pressures it imposes
on the crofter is, therefore, in order.

The Township

621 The efficient unit in the local economy is the township,
632 the modern equivalent of the joint-tenants' and tacksmen's
farms. Each township consists of a variable number of individua
holdings, the low-lying arable and improved grass land held
under hereditary tenure, and a more or less extensive area
of rough, unimproved hill grazing held in common. The common,
concurrent right of each crofter to use the hill grazing under
the "souming" principle gives the township its focus.

[11] cf. Darling and Morley, loc. cit.

871 island. Being taught about the larger world beyond, most
155 children begin to show exasperation with the croft and the
157 duties it imposes. At first they become reluctant to do their
133 chores after school hours or on holidays, or unable to escape the strong authority of their fathers, they do the work grudgingly. This is especially true of those who are planning to go to a university. While many boys take an interest in the stock and like to plough, if there is a tractor, they frequently complain about the slow pace, the boredom of the long winters, the restrictions on their time, and the weather--above all, the weather. Girls are no less outspoken. In particular, the girl who has been left behind by her older brothers and sisters to care for the parents will feel that such a life leaves much to be desired. She learns of another, entirely different life in school, and she hears her siblings tell of this new life when they return for a visit. Naturally, she begins to think digging potatoes is beneath her dignity. The most frequently heard complaint is, "You can't dress out here." The underlying conflict for both boys and girls in their teens seems to be one between a desire for adventure or opportunities for individual choice and the routine, circumspect behavior expected of them.

593 Added to this desire is the realization that they may
882 not really be needed at home. The small crofter with a piece of land hardly larger than a German laborer's garden can handle all the necessary chores by himself or, at periods of peak activity, with the cooperation of his wife and his neighbors. A medium sized croft may provide work for one, two, or even

685 deviants without recourse to the court. Indeed in Kilmuir
627 they do so well that I never heard of any theft. Still, there has been some theft in Glendale. Shortly before each cattle sale the shepherds on the club farm found one or two cattle had disappeared. At first they thought the cattle might have gone over the cliff, but coincidence soon indicated they had a thief in their midst. One of the crofters, a retired Glasgow policeman, took a hand in discovering the guilty party. At length he found out who it was. At the annual meeting several weeks later, he stood up and told the shareholiers exactly what he had seen. Here were the facts, in detail. He did not, however, name the guilty person. After he had finished, the crofters calmly asked him to retell several parts of his story, and then there was a period of silence. Finally, the man publicly confessed and expressed repentance. He was not cast out or handed over to the police -- I doubt if the police know of this even now. His humiliation was sufficient punishment.

682 Among such crimes and the forms of social control which
763 they prompt, however, murder is almost unknown, deterred by the tales which tell of being plagued by the man's ghost to the grave, and suicide is extremely rare, with only three cases in many, many years. Much more important, however, is the influence of social control over public behavior.

683 During my stay on Skye, I was struck by the lack of overt
183 aggression. Aggression was an outstanding characteristic of the
157 culture during the days of the clan, as the Crown ruefully

683 discovered on many occasions. I once entertained the thought
183 that its absence was indicative of a decadent culture. Then
157 I discovered that it was a traditional norm of behavior. Only once during the modern period has there been any aggressive behavior, during the closing years of the "Clearances." Some who remember these "old warriors" who were not afraid to stand up for their rights wonder why their descendents have changed.

793 Today only the ministers are aggressive in their dealing with their congregations, and they reserve their aggressive pose for their Sunday sermons. Naturally, the people quarrel among themselves and a couple of drunken men may come to blows with each other or the policeman who interferes. In any group situation or in any dealings with outsiders, however, dislike or resentment takes the form of placid resistance. The Islander

683 remains courteous and suffers in silence. This is "affect
183 suppression," resultant from Protestantizing the crofters.[39]
157
626 Even the talkative individual, unless he stands among the gentry or has achieved prestige status through his profession, is considered an eccentric. He must stand the snickers of the group and bear the title of a "worthy," a man who does not act his age.

Real anger, manifested by a loud or quavering voice, or
152
626 table pounding, clenching one's fist or other recognizable signs,
156 is not characteristic of the Sgiathgnach in public. The man who forgets himself is always taken in hand by the minister, an old man, or a teacher. He may feel righteous indignation, but if he

[39] I am indebted to Conrad Arensberg for calling my attention to this fact.
